Contents of the AppleLink Tech Info Library (7/94)

Article Created: 4 February 1985
Article Last Reviewed: 11 April 1994

TOPIC -----

This article describes the information that can be found in the Tech Info Library.

DISCUSSION -----

The Tech Info Library (TIL) contains over 10,000 technical articles related to Apple products and their issues. The articles are continuously reviewed and updated with new and revised product and technical information. The TIL is the same database used by the Apple technical support teams. The TIL contains valuable information that will help you sell, support, and use Apple products.

The TIL contains specific articles that describe:

- Technical product specifications
- Product compatibility information
- How to setup and interface products
- Answers to commonly asked questions
- Clarifications and updates to manuals
- Descriptions of known problems and, in many cases, workarounds

Specific information on searching the TIL is available in the "Help: How to Search the AppleLink Tech Info Library" article or by pressing the "Library Help" button in the Tech Info Library window of AppleLink.

If you have comments about any of the Tech Info Library articles, please send a memo to the AppleLink address TECH.DB.

Library Help: How to Search the AppleLink Tech Info Library

=====

Article Created: 4 February 1985
Article Reviewed/Updated: 5 April 1994

TOPIC -----

This article gives helpful search information for the Tech Info Library (TIL).

DISCUSSION -----

The purpose of this document is to help you, the AppleLink customer, make best use of Apple's technical support database: The Tech Info Library.

The Tech Info Library (TIL) contains over 14,000 articles written in a topic and discussion format on Apple products, past and present. It is constantly updated with new and revised product information. It is the same database used by Apple's technical support teams.

There are two ways to search the Tech Info Library:

1) To type a text query, enter the desired search topic and click the Search Library button. The number of documents found will appear in the Results window. To view the titles of these documents click on the Display Selections button. This will display a list of all TIL documents that contain your search criteria. Double-click on the title of the document you wish to view, to open the article.

2) To locate articles by topic, click the Library Index button. You will then see articles grouped in subject folders. This is an easy way to browse through articles on a specific subject area.

CORRECT SPELLING -----

To insure a complete search, it is important to spell correctly. Products are indexed into the TIL by their full name. Capitalization and trademark symbols are not necessary.

USE FULL PRODUCT NAMES -----

When making searches, it is important to use the full product name. In the past, we implemented a feature of the TIL to allow for typing errors and abbreviations. For example, you could search for "mac" instead of "macintosh." This feature produced less than desirable results. It is no longer being used.

For a complete listing of all Apple product names, see the Apple Computer, Inc. Trademark List. This can be located by searching for "trademark list" in the TIL Search window.

KEYWORD SEARCHES: -----

The following keywords can help you easily narrow a search in the Tech Info Library. For best results, use a keyword and a product name. For example, the search string:

EXAMPLE "SPECSHT and Quadra 840AV"

This will find the "Quadra 840AV: Specifications" article.

The current list of all keywords follows:

Topic	Description	Keyword
Cable Info	Cable, port pinouts, info	CABINFO
Compatibility	Hardware, Software Compatibility info	KCOMPAT
Emerging Issues	Emerging Support issues	KISSUE
Internet Related Information		KINTER
Hardware Troubleshooting	Hardware problem Q and A articles	HTS
Matrix/Table Support	Charts detailing RAM, VRAM support for specific computers	KTABLE
Network Troubleshooting	Network problem Q and A articles	KNTS
On Line Information		KOL
Newton MessagePad	Newton topics, including HW & SW	KNMP
PowerBook	PowerBook articles	KPBOOK
PowerPC	Technical, support info on PowerPC	KPPC
Software Troubleshooting	Software problem Q and A articles	KSTS
Specification Sheets	Spec Sheets for all Apple products	SPECSHT
Support Issues	Support issues for specific products	SUPT
System 7 Articles	Q and A articles on System 7 family	SYS7
System 7.5 Articles	Q and A articles on System 7.5	SYS7.5
Third Party Compatibililty Lists		PCOMPAT
Third Party Info	Third party developer directory	3PTY
Windows/DOS	Technical, support info on Windows and DOS products, working with Apple products.	KWINDOW

FULL SEARCH PHRASE -----

It is possible to use a full search phrase when searching the TIL.

EXAMPLE: search for "color stylewriter pro"

This will find all articles that contain the exact phrase "Color Stylewriter Pro."

SEARCHING TIP: -----

Use "AND" between search terms:

EXAMPLE: If you're looking for information on toner cartridges for a LaserWriter, type the search string "laserwriter and toner" This query will find every occurrence of both these words in a single document. You can also use "OR" and "NOT," as well.

HELPFUL INFORMATION: -----

Limits

- A query may not have more than 25 operators.
- A query phrase may not exceed 30 words (or 200 characters).
- A query may not exceed a combination of 50 words and operators.

Lexical Trimming

The Library search mechanism automatically does something called "lexical trimming" with your search words. This means that it removes any common suffix you've used in your search word before it looks for matching words. If you type the word PRINTER as a search word, the search retrieves articles that contain the words PRINT, PRINTER, PRINTING, PRINTED, and so on.

The following characters give you an error message if you try to use them alone. You can use them mixed with real terms.

-
:
"
\$

.
!

You cannot embed these characters in a term, since they will separate the terms:

&
,

Apple II and IIf: Power Supply Input Frequency Limitations

=====

This article last reviewed: 18 September 1987

The Apple II and IIf power supply is a switching power supply. It is designed to accept 107 to 135 volts from DC to 60 Hz. It will also work at up to 400 Hz but this endangers a circuit which protects the supply from shorting to the point that the protecting circuit will not work.

Apple II, IIe and IIC: Mini-Assembler

Revised: 5/3/88
Security: Everyone

Apple II, IIe and IIC: Mini-Assembler

=====

This article last reviewed: 21 September 1984

This note covers use of the Apple II, IIe and IIC mini-assembler only, not the II+. This is not a course in assembly language programming. For a reference on programming the 6502 microprocessor, refer to the Synertek Programming manual or any of the tutorials available. This note assumes the user has a working knowledge of 6502 programming and mnemonics.

The Apple II mini-assembler is a programming aid aimed at reducing the amount of time required to convert a handwritten program to object code. The mini-assembler is basically a look-up table for opcodes. With it, you can type mnemonics with their absolute addresses, and the assembler will convert it to the correct object code and store it in memory.

Typing "F666G" will puts you in mini-assembler mode. While in this mode, any line typed in will be interpreted as an assembly language instruction, assembled, and stored in binary form unless the first character on the command line is a "\$".

If the first character of a command line is a "\$", the remainder of the line will be interpreted as a normal monitor command, executed, and control returned to the mini-assembler. To get out of the mini-assembler, press RESET.

If the first character on the line is blank, the assembled instruction will be stored starting at the address immediately following the previously assembled instruction. If the first character is not a blank nor a "\$", the line is assumed to contain an assembly language instruction preceded by the instruction address (a hex number followed by a ":"). In either case, the instruction will be retyped over the line just entered in dis-assembler format to provide a visual check of what has been assembled.

The counter that keeps track of where the next instruction will be stored is the pseudo PC (Program Counter) and it can be changed by many monitor commands (eg. 'L', 'T', . . .). Therefore, it is advisable to use the explicit

instruction address mode after every monitor command and, of course, when the mini-assembler is first entered.

Errors (unrecognized mnemonic, illegal format, etc.) are signalled by a "beep" and a caret ("^") will be printed beneath the last character read from the input line by the mini-assembler.

The mnemonics and formats accepted by the mini-assembler are the same as those listed by the 6502 Programmers Manual, with the following exceptions and differences:

1. All imbedded blanks are ignored, except inside addresses.
2. All addresses entered are assumed to be in hex (rather than decimal or symbolic). A preceding "\$" (indicating hex rather than decimal or symbolic) is therefore optional, except that it should not precede the instruction address).
3. Instructions that operate on the accumulator have a blank operand field instead of "A".
4. When entering a branch instruction, the argument of the branch mnemonic should be the address of the target of the branch. If the destination address is not known at the time the instruction is entered, simply enter an address that is in the neighborhood, and later re-enter the branch instruction with the correct target address. NOTE: If a branch target is specified that is out of range, the mini-assembler will flag the address as being in error.
5. The operand field of an instruction can only be followed by a comment field, which starts with a semicolon (";"). Obviously, the mini-assembler ignores the field and in fact will type over it when the line is typed over in disassembler format.
6. Any page zero references will generate page zero instruction formats if such a mode exists. There is no way to force a page zero address to be two bytes, even if the address has leading zeroes.

In general, to specify an addressing type, simply enter it as it would be listed in the disassembly. For information on the disassembler, see page 49 of the Apple II Reference Manual.

Apple II+ Mini-Assembler (1 of 4)

Revised: 3/2/88
Security: Everyone

Apple II+ Mini-Assembler (1 of 4)

=====

This article last reviewed: 21 September 1984

The attached listing is a relocated version of the mini-assembler for the Apple II+ with instructions for the Apple II version. This version can be BRUN from the disk or BLOAded and start with CALL 2048 from Applesoft. To restart use CALL 2051. From machine language the start is 800G and the restart is 803G. Users who have Integer Basic available need only enter that language and use the instructions in part one of this note.

Please note that the mini-assembler performs a NEW command, so it will wipe out any resident Applesoft program. Also note that the mini-assembler loads from \$800 to \$947. Don't try to assemble anything into those locations.

This note covers the operation of the mini-assembler only. It is not a course in assembly language programming. For a reference on programming the 6502 microprocessor, refer to the Synertek Programming manual or any of the tutorials available. This note assumes the user has a working knowledge of 6502 programming and mnemonics.

The mini-assembler is a programming aid aimed at reducing the amount of time required to convert a handwritten program to object code. The mini-assembler is basically a look-up table for opcodes. With it, you can type mnemonics with their absolute addresses, and the assembler will convert it to the correct object code and store it in memory.

Typing "F666G" puts the user in mini-assembler mode. While in this mode, any line typed in will be interpreted as an assembly language instruction, assembled, and stored in binary form unless the first character on the command line is a "\$".

If the first character of a command line is a "\$", the remainder of the line will be interpreted as a normal monitor command, executed, and control returned to the mini-assembler. To get out of the mini-assembler, press RESET.

If the first character on the line is blank, the assembled instruction will be stored starting at the address immediately following the previously assembled instruction. If the first character is not a blank nor a "\$", the line is assumed to contain an assembly language instruction preceded by the instruction address (a hex number followed by a ":"). In either case, the instruction will be retyped over the line just entered in dis-assembler format to provide a visual check of what has been assembled.

The counter that keeps track of where the next instruction will be stored is the pseudo PC (Program Counter) and it can be changed by many monitor commands (eg. 'L', 'T', . . .). Therefore, it is advisable to use the explicit instruction address mode after every monitor command and, of course, when the mini-assembler is first entered.

Errors (unrecognized mnemonic, illegal format, etc.) are signalled by a "beep" and a caret ("^") will be printed beneath the last character read from the input line by the mini-assembler.

Apple II, IIe and II+: Auto-Run Apple w/o DOS (1 of 2)

=====

This article last reviewed: 21 September 1984

Some applications require that an Apple start running an Applesoft program from power-up without human interaction. This is easy with the disk and Auto-Start ROM. Simply initialize the diskette with the desired program in memory and the disk will boot and run it when the power comes on. But sometimes a disk drive is undesirable, especially where there is only one program to run and the cost must be kept low. So here is a way to have a card that will load and run an Applesoft program automatically on power-up in any Apple II+.

I will assume the use of a card like the Mountain Computer ROM+ that has a 256 byte "control ROM" and room for some larger ROMs to store the Applesoft program. On the ROM+ this is a bank of up to six 2716 type EPROMs. Using EPROMs has the advantage that you can change your Applesoft program later by erasing the EPROMs and reprogramming and the disadvantages of higher cost and using more power from the Apple's power supply. The power consumption of the EPROMs won't be a problem if the Apple isn't filled with cards.

The software in the control ROM is required to do five things:

1. Pretend that it's a disk controller card so that the Auto-Start ROM will execute its code.
2. Initialize Applesoft.
3. Move an image of the Applesoft program down from the ROMs into the proper area of RAM.
4. Set up the required Applesoft pointers for the end of the program.
5. RUN the program.

All that's needed to convince the Auto-Start that there's a disk controller card out there is to have a ROM whose first four odd bytes match the Apple P5

or P5A PROM. If the monitor finds a ROM that matches it in slot N, it will do a jump to \$CN00. The routine that does this starts at \$FAA6 and is listed on page 144 of the Apple II reference manual. The first eight bytes in the control ROM will be

24 20 24 00 24 03 24 3C

Note that by having the even numbered bytes equal to \$24, (BIT Page zero) when the code is executed starting at \$CN00 nothing will happen until the byte after the \$3C.

The proper way to initialize Applesoft is to jump to \$E000. Unfortunately this entry into Applesoft falls into the normal command level routine. To regain control so that the control ROM can load a program we can use the same trick that DOS uses. As soon as Applesoft reaches its command level it prints a prompt, ("]") and waits for the user to type in a command. Since all input and output in the Apple is handled through two pointers in RAM, we can divert the input routine to point back into the control ROM. This will leave several levels of subroutine on the 6502 stack but Applesoft will re-initialize the stack when we RUN the program so it doesn't matter.

Now the question becomes what address to put into the pointer. The control ROM's address will change depending on which peripheral slot it's plugged into.

The low byte is just the offset from the start of the ROM since the address always starts on a 256 byte boundary but the high byte could be anything from \$C1 to \$C7. When the Auto-Start ROM looks for a disk controller card it saves the high order byte in \$7F8. So the contents of \$38 and \$39, the input pointer, becomes the offset which is stored at location \$7F8. Then we can jump to \$E000 to initialize Applesoft confident that we will regain control when it's done.

Article Last Reviewed: 3 May 1988
Article Last Updated: 3 May 1988

For the next step a copy of the image of the application program needs to be programmed into the EPROMs. The program starts at the address pointed to by \$67 and \$68 and ends at the address pointed to by \$AF and \$B0. The contents of the end address pointer, \$AF and \$B0, will be inserted in the control ROM at locations \$1F and \$23. When control comes back through the input routine pointer, Applesoft has already initialized \$67 and \$68. So the next step is to move the image of the Applesoft program down to where it originally came from. How this is done will depend on the hardware of the ROM card and the length of the Applesoft program. If you use the Apple firmware card you will have to address the soft switch to select the firmware card and then address the switch again to re-select the Applesoft ROMs. With the ROMPLUS it could be as simple as using the monitor move routine, \$FE2C, to move a program of less than 2 kilobytes long.

There is a little more initialization to be done before the Applesoft program can be RUN. The end of program pointer mentioned earlier must be put into \$69 and \$6A and one more Applesoft routine must be called. Unfortunately this one also drops into Applesoft's command mode so we have to modify the input pointer again to point to a third part of the control ROM. Once this is done the final initialization can be done with a jump to \$D4F2.

And now the final part, we need to reset the input pointer so that the program can input normally from the keyboard and actually RUN the program. To make things easier there is a routine set by the Auto-Start ROM that will set the input pointers to the keyboard at location \$FE89. Then all that's left to do is jump to \$D566 which will run the program.

For a bit of finesse, if we put a \$80 into location \$D6, the user will not be able to list the program. In fact any attempt to do any Applesoft command except LOAD from cassette will cause the program to RUN. Also, by changing the reset vectors in the Auto-Start ROM to point to the RUN routine, the

program will become very difficult to stop or modify. (To change the reset vector, load memory starting at \$3F2 with 66 D5 70. See page 36 and 37 of the Apple II Reference manual for more details)

THE LISTING

This listing is all done relative to the start of the ROM so all address are given as one byte. If you use an assembler, simply origin the code in RAM and when it is programmed into the control ROM it will work just fine. The routines are not arranged in order of execution so that the move routine will be at the end since the length of the move routine will vary with the hardware requirements. Just be sure that the three byte jump is inserted behind the move routine.

Apple II and ILe: Interface I/O Signal Timing (2/97)

=====

Article Created: 21 September 1984
Article Reviewed/Updated: 28 February 1997

TOPIC -----

This article describes how the I/O strobe signals on the Apple II peripheral connector are handled.

DISCUSSION -----

The I/O strobe signals on the Apple II peripheral connector are decoded from the appropriate address lines and combined with the phase one clock. This is to reduce the TTL circuitry required to build a simple I/O port.

A simple 8 bit output port would be a positive edge triggered latch with the clock tied to I/O select.

74LS374

D6	-----	17		16	---
D7	-----	18		19	---

Assumming that this interface is plugged into slot 1, any write operation to \$C090..\$C09F will transfer the data to the output lines. This is a very simple interface, so any read to \$C090..\$C09F will transfer random data to the output latch and to the Apple.

Apple III: Game Paddles

=====

This article last reviewed: 21 September 1984

Standard Apple II 150K game paddles cannot be used with the Apple III. A high impedance potentiometer like the Apple II paddle will not work properly connected to an Apple III port.

The analog inputs on Port A and Port B of the Apple III are designed to read a voltage between 0 and 2.4 volts and convert it to a number between 0 and 255. The schematic on page 82 of the Apple III Owner's Guide is drawn for a joystick with 5,000 ohm potentiometers. Only the bottom 20% of the potentiometer's range is used. Using the +12 volt power supply will result in the most stable readings.

The following circuit can be used if the entire range of the potentiometer is desired.

The voltage range at the GC inputs should go from 0v to 2.4v. The value of Rs can be calculated for +5 volt systems with this formula:

$$R_s = R_p * 2.6 / 2.4$$

For +12 volt systems use

$$R_s = R_p * 9.6 / 2.4$$

Revised: 10/5/92
Security: Everyone

Apple III: Joystick Input--Apple II Game Incompatibility

=====

This article last reviewed: 21 September 1984

Some machine language games that use the paddle inputs will not work on the Apple III. The hardware for reading the analog inputs is different, and some software will not be able to take this into account.

Also, the joystick ports on the back of the Apple III are arranged such that some games won't work properly in Emulation mode. Most joystick oriented games will use PDL (0) and PDL (1) for X-Y control. The ports on the Apple III put these signals on different connectors. Here are the Apple II Emulation Mode equivalents of the signals available on ports A and B.

pin	Port A	Port B
4	PDL (0)	PDL (1)
5	PB1	PB2
8	PDL (2)	PDL (3)
9	PB3

MPW: Problem with replace command in shell

=====

In the shell of MPW 1.0, 1.0.1, and 1.0.2, there's a problem using the replace command to change the tag operator (option-r). The error message '### replace - Invalid Option-r statement.' results from using either of two commands,

```
replace /'Option-r'/ 'Option-r'
or
replace /Option-dOption-r/ 'Option-r',
```

where the first Option-r in each line is the tag operator and the Option-d is the shell escape character.

To work around the situation, use two commands,

```
Find /'option-r'/
and
Replace option-6 option-r
```

where the first option-r is really the tag symbol, option-6 is really the selection symbol, and the second option-r is really option-r.

Apple III: System Failure Errors

=====

The following table attempts to explain the numbers that are displayed following a SYSTEM FAILURE. A system failure is generally a hardware problem. Try recreating the same error with the same software on another Apple III to confirm if it is software or hardware that is causing the failure.

Copying certain protected diskettes will cause an error \$06 when the copy is booted. This is a normal effect of the protection scheme.

\$01	BADBRK	Break instruction from within SOS
\$02	BADINT1	Interrupting device not found
\$03	BADINT2	Bad zero page allocation
\$04	NMIHANG	Unable to lock NMI
\$05	EVQOVFL	Event queue overflow
\$06	STKOVFL	6502 stack overflow
\$07	BADSYSCALL	DMGR detected invalid request code
\$08	MCTOVFLOW	DMGR - too many device handlers
\$09	MEM2SML	Memory size less than 64K
\$0A	VCBERR	BFMGR - volume control block not useable
\$0B	FCBERR	File control block crashed
\$0C	ALCERR	Allocation blocks invalid
\$0D	DIRERR	Directory is not correct
\$0E	TOOLONG	Pathname buffer overflow
\$0F	BADUFNUM	Invalid buffer number
\$010	BADBUFSIZ	Invalid buffer size (=0 or >16K)

Apple III: Emulation Mode--Controlling Bit 8 of the RS-232 Port

Revised: 10/29/84
Security: Everyone

Apple III: Emulation Mode--Controlling Bit 8 of the RS-232 Port

=====

This driver allows the user to control bit 8 of the built-in RS-232 port in Emulation Mode. Bit 8 is used by some printers to select expanded or normal print mode or to enable alternate or graphics character sets. DOS 3.2 or DOS 3.3 is required to use this routine. Both the Serial Card Emulation and the Communications Card Emulation are supported.

SOFTWARE ENTRY

Boot a DOS diskette and enter the monitor with CALL -155 and type

```
3B0:A9 07
:20 95 FE
:A9 80
:20 ED FD
:A9 C5
:85 36
:A9 03
:85 37
:4C EA 03
:29 7F
:0D CD 03
:4C 07 C7
:80
```

To check your typing, type

```
3B0L
```

and compare your listing to the one below.

03B0-	A9 07	LDA	#\$07
03B2-	20 95 FE	JSR	\$FE95
03B5-	A9 80	LDA	#\$80
03B7-	20 ED FD	JSR	\$FDED
03BA-	A9 C5	LDA	#\$C5
03BC-	85 36	STA	\$36

03BE-	A9 03	LDA	#\$03
03C0-	85 37	STA	\$37
03C2-	4C EA 03	JMP	\$03EA
03C5-	29 7F	AND	#\$7F
03C7-	0D CD 03	ORA	\$03CD
03CA-	4C 07 C7	JMP	\$C707
03CD-	80	???	

Now return to Basic with 3D0G

SAVING THE PROGRAM TO DISK:

Save the driver to disk by typing

```
BSAVE SERIAL DRIVER, A$3B0, L$1E
```

USING THE PRINTER:

The driver should be in memory before you want to use the printer. You must load the driver and initialize the interface.

From command mode type

```
BLOAD SERIAL DRIVER
CALL 944
```

This may be done from a program by entering

```
100 PRINT D$;"BLOAD SERIAL DRIVER" : CALL 944
```

assuming that D\$ contains a CTRL-D.

If you want to switch back to the video monitor for output type

```
PR#0
```

or in a program enter

```
200 PRINT D$;"PR#0"
```

Then to reconnect the printer, all that is required is

```
CALL 954
```

or from a program

```
300 CALL 954
```

SETTING THE PRINT MODES:

To set normal print mode POKE 973,0

To set expanded print mode POKE 973,128

Apple III: Console Driver--Screen Mode Switching Program

=====

The following program is a demonstration of how to change the Apple III screen mode.

```
PROGRAM SCREENTEST;
```

```
PROCEDURE SCREENMODE (NUMBER: INTEGER);
```

```
VAR CH: CHAR;
```

```
BEGIN
```

```
  IF NUMBER IN [0..2] THEN BEGIN {If the given number is valid}
    WRITE (CHR (14));              {turn off the screen and}
    CH := CHR (16);
    UNITWRITE (1, CH, 1, , 12);    {send the prefix character}
    CH := CHR (NUMBER);
    UNITWRITE (1, CH, 1, , 12);    {and the mode character.}
    IF NUMBER = 2 THEN WRITE (CHR (1)); {If 80 column, restore}
                                   {viewport.}
    WRITE (CHR (28), CHR (15)); {Clear screen and turn it on.}
  END ELSE WRITELN (CHR (7), 'SCREENMODE ERROR '); {else OOPS!}
```

```
END;
```

```
PROCEDURE TESTERROR;
```

```
BEGIN
```

```
  WRITE (CHR (28));                {Clear the screen.}
  GOTOXY (0,11);
  WRITE ('This will generate an error. '); {Write some text.}
  SCREENMODE (5);                  {Set an invalid mode.}
  WRITELN;
  WRITE ('Press RETURN to continue: ');
  READLN;
```

```
END;
```

```
PROCEDURE TEST40;
```

```
BEGIN
```

```
  SCREENMODE (0);                  {Set 40 column B/W mode.}
  GOTOXY (0,11);
  WRITELN ('This is 40 column text mode.');
```

```
        WRITELN;
        WRITE  ('Press RETURN to continue: ');
        READLN;
END;

PROCEDURE TESTCOLOR;
BEGIN
    SCREENMODE (1);                {Set 40 column color mode.}
    WRITE (CHR (20), CHR (4));      {Set background to Dark Green.}
    WRITE (CHR (28));               {Clear the screen.}
    WRITE (CHR (19), CHR (13));     {Set foreground to Yellow.}
    GOTOXY (0,11);
    WRITELN ('This is 40 column COLOR mode. ');
    WRITELN;
    WRITE  ('Press RETURN to quit: ');
    READLN;
END;

BEGIN
    TESTERROR;
    TEST40;
    TESTCOLOR;
    SCREENMODE (2);

Security: Everyone

Apple III: Console Driver--Changing the Character Set

=====

The console driver has a control call that will load up to eight new character definitions for the video display. Here is a Pascal program that will change one character.

```
PROGRAM SWAP;
VAR
  UNITNUM      : INTEGER;

  REQUESTCODE  : PACKED RECORD
    CHANNEL      : 0..1;
    STAT_OR_CTRL : 0..1;
    REQUEST_NUM  : 0..255;
    RESERVED     : 0..63;
  END;

  DATA        : PACKED RECORD
    NUMBER       : 0..255;
    CHARACTER    : CHAR;
    INFO         : PACKED ARRAY [1..8] OF 0..255;
  END;

BEGIN
  WITH REQUESTCODE DO BEGIN
    CHANNEL:=0;
    STAT_OR_CTRL:=1;
    RESERVED:=0;
    REQUEST_NUM:=17; { character replace code }
  END;

  WITH DATA DO BEGIN
    NUMBER := 1;      { How many characters to change }
    CH := ' ';        { which character to change }
    INFO [1] := 255; { character definition }
    INFO [2] := 255; { See page 166 of the }
    INFO [3] := 255; { STANDARD DEVICE DRIVER MANUAL }
    INFO [4] := 255;
```

```
        INFO [5] := 255;  
        INFO [6] := 255;  
        INFO [7] := 255;  
        INFO [8] := 255;  
    END;  
  
    UNITNUM:=1;  
    UNITSTATUS (UNITNUM, DATA, REQUESTCODE);  
    WRITELN ('ALL_SPACES_WILL_NOW_DISPLAY_AS_" " !');  
END.
```

Apple Access III: Business Basic Bootable Diskette

Revised: 10/29/84
Security: Everyone

Apple Access III: Business Basic Bootable Diskette

=====

The instructions on page 36 for creating a Business Basic bootable diskette are misleading. Here is another way:

1. Use System Utilities to format disk with name APPLCOM.
2. Copy the files SOS.KERNAL, SOS.INTERP, and SOS.DRIVER from the Business Basic disk to APPLCOM.
3. Copy the files ACCESS3, ACCESS3.INV, ACS3FONT from the Apple Access III disk to APPLCOM.
4. Use the System Configuration Program to add RS232.DRIVER to /APPLCOM/SOS.DRIVER.
5. RENAME ACCESS3, HELLO
6. Type the following commands to restore the cursor wrap-around feature when you exit Access3:

```
LOAD HELLO
45 PRINT CHR$(4)
SAVE HELLO
```

7. Re-boot the system with /APPLCOM in the built-in drive.

Please refer to chapter 4 of the Apple III Owner's Guide for instructions on formatting diskettes, copying files, and using the System Configuration Program.

Apple Writer II: DOS Version--Printing With Parallel Printers

=====

Apple Writer may not work properly with some parallel interface cards. Often the interface requires a CTRL-I sequence if it is to print wider than 40 columns. This is easy in Apple Writer II. All you need to do is insert the

<CTRL-V><CTRL-I><CTRL-V> 132N

at the start of each file. You will have to use the CTRL-V before and after the CTRL-I to enter it into the file. Please refer to page 51 of the Apple Writer manual for more details.

Apple Writer IIe under ProDOS: Printer codes from all Apples

Revised: 4/30/86
Security: Everyone

Apple Writer IIe under ProDOS: Printer codes from all Apples

=====

Many printers have special features that the computer signals by sending command codes. To send codes to a printer from Apple Writer IIe (version 2.1) under ProDOS, you must insert the codes into the Apple Writer file you want printed. The manual of the printer may list the codes by several names: decimal, hexadecimal, teletype abbreviations (SOH, ETX, DC1, DC3, etc.), standard keys, and combinations of the above.

Using the chart "ASCII characters, values, and keystrokes", you have to translate from the name of the code in the printer manual into the name of the corresponding keystroke or keystrokes on the keyboards of the Apple IIe, Enhanced Apple IIe, or Apple IIc.

Some keystrokes put so-called control characters into the Apple Writer file. These control characters are not part of the conventional English character set; while screen shows them, the printer intercepts and does not print them, instead recognizing them as signals to turn special functions on and off or to change printer settings.

NOTE: In the descriptions of the keystrokes, the characters greater than and less than, < and >, are used to contain one keystroke, which can mean that:

1. You must simultaneously hold down the control key, the shift key, or both as you press the other key, or
2. You must press a special key, such as ESC or RETURN.

With these considerations in mind, here is a list of codes and methods for inserting them in an Apple Writer file.

Null (ASCII value 0):

Because Apple Writer IIe (version 2.1) under ProDOS uses the null character to mark the end of a file, Apple Writer does not allow a null to be inserted into the file. The inserted null would effectively delete any text after it.

Apple Writer does send a null in the place of a Control-Underline character:

<CTRL-V><CTRL-UNDERLINE><CTRL-V>

Control-A through Control-Z (ASCII decimal values 01 through 26):

Example: Control-Z (ASCII decimal value 26): <CTRL-V><CTRL-Z><CTRL-V>

Exception: Control-V (ASCII decimal value 22) can't be entered.
See "Missing Characters" below.

Escape (ASCII value 27): <CTRL-V><ESC><CTRL-V>

Other Control characters: These can be entered in the manner of Control-A through Control-Z.

Missing Characters:

In typing a file, there is no way to put a Control-V into the text.
During printing, Apple Writer doesn't send a Control-Underline as such.

Applesoft BASIC can be used to send a Control-V or Control-Underline to your printer.

1. Create your Apple Writer document as usual, but substitute unique characters in each place that you want a Control-V or Control-Underline character.
2. Type <CTRL-P> to display the Print/Programs Command menu.
3. Type PD8, Apple Writer's code for Print to Disk on an Apple II.
4. Type NP to begin printing.
5. To the Apple Writer prompt for a file name, do not enter the same name with which the file is already saved. Enter a unique name, and note it down.
6. After the printing to disk is finished, exit Apple Writer and boot up a ProDOS diskette.
7. Run the following program, using the following forms of line 330:

Control-V

```
330 IF C$=X$ THEN C$=CHR$(22)
```

Control-Underline

```
330 IF C$=X$ THEN C$=CHR$(31)
```

```
100 HOME

Apple Writer III: Footnotes

Revised: 10/29/84
Security: Everyone

Apple Writer III: Footnotes

=====

Footnotes longer than 132 characters will stop Apple Writer III (versions 1.0 and 1.1) while printing with a WPL "FOOTNOTE OVERFLOW" error. There is no fix available at this time.

When a footnote is inserted in the text, the character immediately following the note is omitted. Example:

The text:

....Apple User's Groups (<For more info, see page 16>)are a good....

How it prints:

....Apple User's Groups re a good....

This problem can be worked around by adding an extra space after the footnote. Example:

....Apple User's Groups (<For more info, see page 16>) are a good....

Footnotes don't obey the Right margin. There is no fix available at this time.

Footnotes won't be printed if there isn't enough text on the page.

Apple Writer III: Available Space

Revised: 10/29/84
Security: Everyone

Apple Writer III: Available Space

=====

Apple Writer III (versions 1.0, 1.1 and 2.0) can edit files up to 65021 characters long at a time. This figure applies to both 128K and 256K Apple IIIs. Please note that as the file gets larger, the computer takes longer to process the typed characters. It isn't unusual for good typists to lose characters as the file grows.

Apple Writer III (versions 1.0 and 1.1): Top Line

Revised: 10/29/84
Security: Everyone

Apple Writer III (versions 1.0 and 1.1): Top Line

=====

The TopLine command changes the default top line, but page 1 may still have a top line. The reason for this is that the default top line gets printed before Apple Writer starts reading text and has a chance to see any .TL commands.

You must insure that the TL parameter in the print options menu is a blank line and that there isn't a .TL command in your file to supress printing of a top line on page 1.

You can also use the default top line to print on page 1 and insert a .TL<CR> in the text to supress printing of the top line on subsequent pages.

The TL command is described on page 66 of the Apple Writer III manual.

INTRODUCTION

ACCESS III Version 1.1 includes numerous new features. This addendum describes these features. It also outlines differences between versions 1.0 and 1.1 and lists problems with version 1.0 and how these problems have been resolved.

This document will be part of the Access III package. The Apple part number for the addendum will be 031-0243-B.

NEW FEATURES SUMMARY

Two new selections have been added to the Set-Up Menu, "Set the answerback" and "Change the recording file name." When you save the Set-Up settings, both the answerback text and the recording file name are saved and restored the next time you run ACCESS III.

You can now prepare a file for transmission and have transmission begin unattended after ACCESS III receives a password that you specify.

And, several new escape sequences have been added that permit a remote computer to completely control the recording capability.

ANSWERBACK

The answerback is a series of up to sixteen characters that is automatically transmitted when ACCESS III receives a CTRL-E (ASCII 5). The answerback can be transmitted by operator command by holding down the open-apple key and pressing E. Selecting "Set the answerback" on the Set-Up menu lets you enter the text that will be transmitted. The answerback is saved along with the other Set-Up characteristics.

REMOTE CONTROL OF THE RECORDING FILE

ACCESS III Version 1.1 has a series of unique escape sequences that allow a remote computer to control the recording file. Sequences are provided to turn the filter on and off, turn recording on and off, and change the name of the recording file. These sequences are available ONLY when ACCESS III is in ANSI mode.

QUEUING FILE TRANSMISSION

You can now prepare a file for transmission and when ACCESS III asks "Are you ready to start transmitting?" you can instruct ACCESS III to queue the file. ACCESS III then asks for a password of up to sixteen characters and displays a "Waiting..." message. ACCESS III waits for the password to be received over

the RS232 line. When the complete password has been received, file transmission begins.

ACCESS III cannot be used while it is waiting for the password, but the wait can be aborted by pressing the ESCAPE key. Pressing ESCAPE also completely aborts file transmission.

When ACCESS III has finished transmitting the file, it automatically returns to terminal mode.

Apple Access III: Addendum (2 of 7)

Revised: 10/29/84
Security: Everyone

Apple Access III: Addendum (2 of 7)

=====

SUMMARY OF CHANGES FROM VERSION 1.0

Changing the name of the recording file is now done from the Set-Up menu rather than from the main menu. The name of the recording file is saved whenever Set-Up characteristics are saved. This makes it possible to name the default recording file anything you want.

The recording filter now defaults to ON. Use the STATUS display to make sure that it is set the way you want.

ACCESS III version 1.1 lets you transmit Pascal text files. The header block is not transmitted, and all DLE sequences are correctly expanded to the corresponding number of blanks. This means that a Pascal text file will appear to the receiving computer exactly the same as keys pressed on the keyboard. Or, to put it another way, characters transmitted will be exactly the same as if you had converted the Pascal text file to an ASCII file using the Pascal Editor, and then transmitted the ASCII file.

WHAT'S ON THE MASTER DISKETTE

If you catalog (or list the directory) of the ACCESS III master diskette you will find the following files:

/APPLCOM	Size	File type
*ACCESS3.CODE	61	Codefile
*ACCESS3.INV	62	Codefile
*RS232.DRIVER	7	Codefile
*ACS3FONT	2	Datafile
*ACCESS3	1	Basicprog
*SPSUB.CODE	3	Codefile
*SOS.DRIVER	27	Sosfile
*SETPREFIX.TEXT	4	Textfile
*SETPREFIX.CODE	2	Codefile
*ACCESS3.PROFILE	1	Basicprog

This is a brief explanation of what each of those files is and why it is on

the ACCESS III master diskette.

ACCESS3.CODE is the Pascal executable version of ACCESS III. ACCESS III is written entirely in assembly language. The assembly module is linked to a small Pascal host program to form this code file.

ACCESS3.INV is a Business BASIC invocable module. This is the codefile that runs when you use Business BASIC.

RS232.DRIVER is the device driver that manages the Apple III built-in RS232 interface. This driver must be part of the SOS.DRIVER file on your boot diskette in order for ACCESS III to function correctly. This driver is exactly the same as the RS232 driver included on the Utilities Data diskette that accompanied your SOS system software.

ACS3FONT is a character set font file in which line graphics characters replace the control character designations in the standard Apple III character set. If your application requires the line graphic characters, then ACS3FONT must be configured into the SOS.DRIVER file on your boot diskette. If you do not use the graphics mode of ACCESS III, then the standard Apple III font may be used.

ACCESS3 is a very short Business BASIC program that invokes the ACCESS III invocable module. When you type "run access3" in Business BASIC, this is the program that is loaded and executed. It also temporarily sets a null prefix so that SOS will look for a diskette named /APPLCOM for ACCESS III files like the recording file and the configuration file. If you want to run ACCESS III from a ProFile, you should not use this program. Instead, see the section, "Using ACCESS III With a ProFile."

SPSUB.CODE is a short assembly language subroutine that sets the SOS prefix in the Pascal environment. It is supplied as a separate subroutine so that together with SETPREFIX.TEXT, you can customize your own prefix setting program if you have special requirements. Only users familiar with Pascal and linking assembly language modules should use this file.

Apple Access III: Addendum (3 of 7)

Revised: 11/7/84
Security: Everyone

Apple Access III: Addendum (3 of 7)

=====

DESCRIPTION OF ACCESS III FILES (CONTINUED)

SOS.DRIVER is a device driver file configured specifically for use with Access III. Simply copy this file onto your boot diskette; alternatively, create you own SOS.DRIVER file using the individual drivers supplied on the System Utilities Data diskette. The SOS.DRIVER includes:

- .CONSOLE
- .SILENTYPE
- .RS232
- .ACS3FONT: is the system font

Furthurmore, four disk drives are configured.

SETPREFIX.CODE is a small Pascal program linked to an assembly language subroutine that allows you to set the SOS prefix. As explained in "Using Access III with a ProFile", setting the prefix with the Pascal filer does not change the SOS prefix, meaning that if you execute Access III from a ProFile without executing the SETPREFIX program, Access III will not be able to successfully save and load the Set-Up selections.

The source listing for the program SETPREFIX.TEST is included, so the prefix setting can be customized for unusual situations.

To successfully run Access III stored on a ProFile in a Pascal environment, you must first execute SETPREFIX, which is described in "Using Access III With a ProFile".

ACCESS3.PROFILE is a Business BASIC program enabling you to run Access III from a ProFile in a Business BASIC environment. The only difference between this program and the Access III Business BASIC program is the way the the prefix is set: Access III sets a null prefix to force SOS to look for a diskette, while ACCESS3.PROFILE sets the prefix to /PROFILE, instructing SOS to look there for a subdirectory. See "ProFile and Business BASIC" under "Using Access III with a ProFile" for additional information.

CHANGES AND NEW FEATURES

CHANGES TO THE MAIN MENU

Changing the name of the recording file is not performed from the main menu: it's now an entry on the Set-Up menu. It's therefore saved along with the rest of the Set-Up settings.

ADDITIONS TO SET-UP MODE

Two new selections to the Set-Up menu are: "Set the Answerback" and "Change the recording file name."

When you save the Set-Up settings, both the answerback text and the recording file name are saved. These Set-Up settings are restored the next time you run Access III.

SET THE ANSWERBACK

Selecting this choice causes the screen to clear and the following message to display:

Answerback text?

Respond by entering your answerback message containing up to sixteen characters followed by a RETURN. The RETURN is NOT stored as part of the answerback text.

The characters that you enter will be transmitted by Access III whenever a CTRL-E (ASCII 5) is received.

To enter control characters in your answerback text, hold down the open-apple key and the CONTROL key while pressing the key you wish to enter. Your control character is displayed as one of the line graphic characters, though it's both transmitted and saved correctly.

See Appendix B of the Access III manual for each key's ASCII code.

You can also cause the answerback text to be transmitted without receiving the CTRL-E: hold down the open-apple key and press the E key.

CHANGE THE RECORDING FILE NAME

Selecting this option clears the screen and closes the old recording file. Access III then prompts you to open a new recording file name:

New recording file name?

A legal answer may be a block file pathname or a character device name such as .SILENTYPE.

ADDITIONS TO THE STATUS SCREEN

The STATUS screen displays the current answerback text as well as all the previously displayed information.

Revised: 11/7/84
Security: Everyone

Apple Access III: Addendum (4 of 7)

=====

NEW FILE TRANSMISSION FEATURES

Version 1.1 of Access III recognizes Pascal text files. It doesn't transmit the header, though it correctly expands the DLE sequences to the proper number of blanks.

You can also queue any file for transmission at a later time: merely enter a "Q" when asked if your ready to transmit. The system prompts you to:

Queue password (ESC-RET to abort)?

Enter your password containing up to 16 characters for the password. After you enter the password and press RETURN, Access III displays:

Waiting...

Access III then compares every word it receives with the password you entered. Upon receiving the exact password from the RS232 port, the system immediately begins transmitting the file you queued. While Access III is waiting for the password to be sent, you're unable to use Access III.

If necessary, abort the wait (or transmisson) by pressing the ESCAPE key.

NEW ESCAPE SEQUENCES

Access III has its own private escape sequences that are not part of the VT100 ANSI escape sequence set. These sequences are active ONLY when Access III is in ANSI mode.

Access III private escape sequences follow the ANSI escape character format: they're followed by a special lead-in character and end with a unique terminator. The format is:

ESC * Pn Ps @

Where ESC is the introductory escape character. The asterisk (*)

represents special character lead-in that identifies the sequence as an Access III private escape sequence. Pn is a single digit parameter number, while Ps is a parameter string appears in the sequence solely to change the recording file name. The unique terminator is the "at sign" @ which is ASCII 64.

In most of the examples of escape sequences, the characters in the sequence are separated by spaces for easier reading. No real escape sequence should ever contain embedded blanks. Doing so will have unpredictable consequences.

The valid values for Pn are:

Pn	Meaning
--	-----
0	Turn recording off
1	Turn recording on
2	Turn the filter off
3	Turn the filter on
4	Change the recording file name

TURN RECORDING OFF

It is possible to have a remote computer turn recording on and off by sending Access III a special escape sequence. To turn recording off, simply have the remote computer send Access III the following characters, in the order shown:

ESC * 0 @

ESC is the escape character (ASCII 27).

TURN RECORDING ON

To turn recording on, send Access III the following characters, in the order shown:

ESC * 1 @

ESC is the escape character (ASCII 27).

TURN THE FILTER OFF

Upon receipt of the following characters, Access III turns the recording filter off:

ESC * 2 @

ESC is the escape character (ASCII 27).

TURN THE FILTER ON

The following characters will cause Access III to turn the recording filter on:

ESC * 3 @

ESC is the escape character (ASCII 27).

CHANGE THE RECORDING FILE NAME

This sequence causes Access III to close the old recording file and open a new one. The name of the new file is included in the sequence. It can be a block file pathname or a character device name.

When Access III is done processing the sequence, it transmits a reply that indicates the success of the operation, or gives an error code that describes the difficulty.

The sequence to change the recording file name is:

ESC * 4 filename @

where ESC is the escape character (ASCII 27), and "filename" is a valid SOS pathname 30 characters in length or less. The sequence must contain NO embedded spaces and it must end with "@".

Some sample sequences:

ESC*4.SILENTTYPE@

ESC*4/APPLCOM/TERMREC@

ESC*4/PROFILE/MYFILE.DATA@

Apple Access III: Addendum (5 of 7)

Revised: 11/7/84
Security: Everyone

Apple Access III: Addendum (5 of 7)

=====

The Reply Sequence

Access III returns an escape sequence in acknowledgment ONLY to a request to change the recording file name. This escape sequence is:

ESC * Pe

where ESC is the escape character (ASCII 27) and Pe is the SOS error code plus 32 (decimal). The offset of 32 is added to the error code so that the reply sequence will not include any control characters which might adversely affect some remote computers.

If the recording file name change is successful, then Pe is the blank character (ASCII 32 plus the SOS OK code of zero). If the new recording file already exists, Pe is 32 (decimal) plus the SOS error code 47 (hex) for a total of 103 (decimal) which is a lower case "g".

When Access III receives the escape sequence commanding the name change, it first checks the new recording file name for validity. If any problems are found, the SOS error code (+32) is returned in the reply sequence. If no problems are found, the old recording file is closed, the new one is opened, and the operation successful reply sequence is sent.

The reply sequence is NOT followed by a carriage return.

If the new recording file cannot be successfully opened, the previous recording file is reinstated. If the previous recording file was a disk file, the file pointer is moved to the end of the file so that any additional recorded information will be added to the end.

A NEW COMMAND KEY

It is possible to force transmission of the answerback text by holding down the open-apple key and pressing the "E" key. The complete answerback text is transmitted every time the "E" key is pressed with the open-apple key held down.

USING ACCESS III WITH A PROFILE

Access III can be used from a ProFile. The procedure differs slightly depending on whether you usually use Pascal or Business BASIC.

No matter what language you are using, you must have a correctly configured SOS.DRIVER file to use the ProFile. The SOS.DRIVER file included on the Access III master diskette does not have a ProFile driver in it. You can use the system configuration feature of the Utility program to add the ProFile driver to the SOS.DRIVER file from the Access III master diskette, or you can construct a new SOS.DRIVER file. Just be sure that your new driver file contains both the RS232 driver and the ACS3FONT character font from the Access III master diskette.

Consult the Standard Device Drivers Manual for instructions on how to configure a SOS.DRIVER file.

In the following discussions it is assumed that the root volume name of your ProFile is /PROFILE. The root volume name is the one that is displayed at the top of any directory listing of the device. If your ProFile has a different volume name, substitute it for /PROFILE in all commands given below.

It is also assumed that you have already configured your system diskette to include the ProFile driver, and you have read and followed the instructions for setting up and using your ProFile.

PROFILE AND PASCAL

If you use Pascal, use the Pascal Filer to create a subdirectory on the ProFile called APPLCOM. This is done with the Make command as follows:

```
M
Make what file? applcom![4]
```

The exclamation point after the subdirectory name tells the Filer that you're creating a subdirectory. The four in square brackets is the amount of space you're allocating for the subdirectory.

After the subdirectory has been created, transfer ACCESS3.CODE to that subdirectory.

```
T
Transfer what file? /APPLCOM/ACCESS3.CODE
To where? /PROFILE/APPLCOM/ACCESS3.CODE
```

Then transfer SETPREFIX.CODE to the root volume of your ProFile.

```
T
Transfer what file? /APPLCOM/SETPREFIX.CODE
To where? /PROFILE/SETPREFIX.CODE
```

Apple Access III: Addendum (6 of 7)

Revised: 8/5/85
Security: Everyone

Apple Access III: Addendum (6 of 7)

=====

BEFORE you execute Access III, you must execute SETPREFIX to set the prefix--for example, if the volume name of your ProFile is /PROFILE, then you must set the prefix to:

/PROFILE

You MUST set the prefix with the SETPREFIX program. If you set the prefix with the Filer, only the Pascal prefix remains set, not the SOS prefix, so Access III will not be able to find the files it needs.

The prefix set with the SETPREFIX program does not interfere with the Pascal prefix; in fact, a different prefix may be set by each. But for the sake of consistency, we suggest that you always set the Pascal and SOS prefixes the same. To do so, set the Pascal prefix from the Filer, then set the same prefix with the SETPREFIX program.

When done, type:

X
Execute what file? APPLCOM/ACCESS3

Access III will now be run from the subdirectory. If you receive an error message, you probably haven't set your prefixes properly.

If the prefixes are correctly set, save the Set-Up settings: they will be loaded automatically the next time you execute Access III.

-->PROFILE AND BUSINESS BASIC

Use the Utility program to make a subdirectory on the ProFile called APPLCOM: select "Make a new subdirectory" from the File Handling Commands. Call this new subdirectory:

/PROFILE/APPLCOM

This directory should have room for 25 files.

Press ESCAPE to return to the File Handling Commands menu, and then select "Copy files" from the File Handling Commands. Put the Access III master diskette into one of the Apple III disk drives, then type:

```
/APPLCOM
```

and press the up-arrow. You will see displayed a list of the files on the Access III diskette on the right hand side of your screen. Press the up and down arrow keys to line up the selection arrow with the name of the file to be selected, and select it by pressing the right arrow. Select the following files from the diskette:

```
ACCESS3.PROFILE
ACCESS3.INV
```

After you have selected both files, press RETURN to accept the selection. For the destination ("To the files:") type:

```
/PROFILE/APPLCOM/=
```

and press RETURN. The files you have selected will be transferred to the subdirectory on the ProFile.

The file ACCESS3.PROFILE is a small Business BASIC program that sets the prefix and invokes Access III. You may need to change it if, for any reason, you have a differently-named subdirectory. To change ACCESS3.PROFILE, type:

```
)load /profile/applcom/access3.profile
)list
```

You will then see the following listing:

```
10 a$=PREFIX$
20 PREFIX$="/PROFILE"
30 INVOKE "APPLCOM/ACCESS3.INV"
40 PERFORM ACCESS3
50 PREFIX$=a$
60 END
```

If you want to shorten the typing required to run Access III, type:

```
)save /profile/applcom/access3
```

Doing so saves a new Business BASIC program called Access III in the subdirectory on your ProFile. It changes the name from ACCESS3.PROFILE to just ACCESS3.

The program works as follows:

```
Line 10 saves the old prefix.
Line 20 sets the prefix to the volume that contains the Access III
        subdirectory.
```

Line 30 brings Access III into memory, and
Line 40 starts it up. When you exit Access III,
Line 50 restores the prefix to its original value.

With this program, you don't have to worry about setting the prefix with the
SETPREFIX program; just type:

```
)run /profile/applcom/access3
```

and everything will work correctly.

NOTE: If the volume name of your ProFile is different from "/PROFILE", you
must change this Business BASIC program so that it sets the correct
prefix. Just substitute the volume name of your ProFile in line 20
before saving the program with the new name.

Apple Access III: Addendum (7 of 7)

Revised: 11/7/84
Security: Everyone

Apple Access III: Addendum (7 of 7)

=====

REPORTED PROBLEM AND THEIR RESOLUTIONS

The following Access III Version 1.0 problems are fixed in version 1.1.

- 1) Access III V1.0 used from Business Basic does not abort the entry of the name of the file to transmit by pressing the ESCAPE key.

Resolution in Version 1.1: fixed.

- 2) When used from Business BASIC, Access III prevents your system from running many programs, including the VOLUMES program.

Resolution in Version 1.1: Fixed.

- 3) Pathnames for non-block files or devices were accepted as valid files to transmit.

Resolution in Version 1.1: Only block file pathnames are accepted. The criteria used is: if there is a leading period, there MUST be an embedded slash.

- 4) Access III displays the open-apple character upon receiving the ASCII 127 character, a character used by many systems as a pad character.

Resolution in Version 1.1: ASCII 127 is eliminated by the recording filter.

- 5) When prompted for the name of your file to be transmitted, the system indicated that pressing ESCAPE would abort--RETURN must also be pressed after pressing ESCAPE.

Resolution in Version 1.1: The message states ESCAPE - RETURN is required.

- 6) It is easy to forget to turn on the recording filter, the typical way files are recorded.

Resolution in Version 1.1: The recording filter is ON by default.

- 7) The recording file name couldn't be changed in version 1.0

Resolution in Version 1.1: The Set-Up menu gives you the option to change the recording file name.

- 8) Access III does not decipher Pascal text files.

Resolution in Version 1.1: Pascal text files are now recognized by their SOS file type code. The header is NOT transmitted, though all DLE sequences are correctly expanded.

- 9) The Version 1.0 manual states a backup disk is included in the package. One diskette, the master diskette is included in this package.

Resolution in Version 1.1: Inclusion of a backup diskette is unnecessary as users are able to make their own backups.

Applesoft: High-Res Collision Counter

Revised: 11/7/84
Security: Everyone

Applesoft: High-Res Collision Counter

=====

Applesoft's High-Res collision counter is a byte that is incremented whenever an object drawn crosses a non-black dot on the screen. Applesoft does not initialize or use this byte.

The collision counter could be used in a game: such as, to detect when a lunar lander hits a mountain. Set the counter to zero, draw the lander, then check for non-zero values indicating the collision. It is up to the you to initialize and check this byte.

Applesoft: HPLOT TO After a Draw

Revised: 11/7/84
Security: Everyone

Applesoft: HPLOT TO After a Draw

=====

The Applesoft DRAW command doesn't set an internal pointer referring to the last plotted point, which a HPLOT TO command could use. Instead HPLOT TO X,Y draws a line from some random point to X,Y.

The following program contains a machine language routine which decodes the position of the last plotted point, thus allowing HPLOT TO X,Y to draw from this location.

```
10 FOR J=768 TO 780
20 READ A
30 POKE J,A
40 NEXT J
50 DATA 32,203,245,166,224,164,225
60 DATA 165,226,76,17,244
100 SHLOAD
110 HGR
120 HCOLOR=3
130 SCALE=1
140 DRAW 1 AT 100,100
150 CALL 768: REM      THIS IS IT!
160 HPLOT TO 10,10
170 END
```

TSSnet: DECnet for the Macintosh

Revised: 7/1/88
Security: Everyone

TSSnet: DECnet for the Macintosh

=====

This article last reviewed: 1 September 1987

Overview

TSSnet is DECnet for the Macintosh. The documentation is fairly straightforward, but installation is somewhat complex. The package includes three applications (NCP, NET Copy, and NET Mail) and a DECnet driver. The driver is copied into the System Folder, and the the Macintosh is reset to load the driver. DECnet is alive in background even when the Macintosh is in another application, permitting access from other systems at any time.

The documentation includes the source calls to implement DECnet in programs to allow true peer-to-peer program use.

NCP

The first time you run NCP, you must know the DECnet node number being assigned to the Macintosh. You must then contact Thursby Software to get a key for the system. The key sets the node number and is the copy protection for the software. On DECnet, the node number is assigned by the Network Manager when the system is first put onto DECnet. DECnet does not automatically assign nodes or broadcast node information. NCP is where you set up the line and circuit information and establish the node table for other DECnet nodes. The user can also restrict access to your node through a user name and password and toggle the network on and off.

NET Copy

NET Copy provide the basic functionality of DECnet End Nodes. The user can view remote directories, type remote files, or print files to a local printer. File transfer is supported for text files or image files. Image files are stored in MacBinary format and will transport to another Mac with full resouce and data forks.

NET Mail

NET mail, compatible with VMS Mail, lets the user create, read, and send mail. A new mail folder may also be created from within the program. Up to 32K can be written into a single memo, with larger documents converted automatically to text files on the disk.

Conclusion

TSSnet makes DECnet available to the Macintosh. Its shortcomings are really the shortcomings of DECnet (such as having to define all the nodes to use them), and it will solve any objections large VAX sites might have to supporting additional protocols.

Thursby Software Systems
5840 Interstate 20 West, Suite # 145
Arlington, Texas 76017
Phone: (817) 478-5070

Thursby recently announced support of the Kinetics EtherSC and EtherPort SE as well as terminal emulation through the DECnet connection.

Applesoft: Using Applesoft Shape Tables from Disk

Revised: 11/7/84
Security: Everyone

Applesoft: Using Applesoft Shape Tables from Disk

=====

The following programs were written to make Applesoft shape tables easier to use.

SHAPE LOADER

The Applesoft SHLOAD statement loads shape tables from a cassette tape and sets up the proper pointer for Applesoft to use. The following program loads the shape table from diskettes as a binary file and sets up the proper pointer for Applesoft. This program assumes the shape table has been entered into the systems memory using the same format, but not necessarily the same addresses, as the example in the Applesoft reference manual. Name the program anything you choose, but be sure to place this routine in the first part of your program, since it destroys string variables while loading the shape table.

```
100 INPUT "WHICH SHAPE TABLE TO LOAD ? ";F$
110 PRINT CHR$(4);"BLOAD ";F$;" ,A$D000"
120 DS = PEEK (977) + PEEK (978) * 256 + 3233
130 HM = PEEK (115) + PEEK (116) * 256 - PEEK (DS) -
      PEEK (DS + 1) * 256
140 PRINT CHR$(4);"BLOAD ";F$;" ,A";HM
150 HIMEM: HM
160 POKE 232,HM - INT (HM / 256) * 256: POKE 233,HM / 256
```

SHAPE SAVER

This program saves your shape table to the disk as a binary file for the SHAPE LOADER routine to use. Load this program before entering the monitor and typing in your shape table. The best place to start your shape table is at \$2000: this leaves alot of room for the shape saver and the table. (Refer to chapter 9 of the Applesoft Reference manual.) After typing in your shape table and checking it, type 3D0G to re-enter Applesoft and to RUN the program.

```
1000 REM SHAPE SAVER
1005 H$ = "0123456789ABCDEF"
```

```
1010 TEXT : HOME : VTAB 5
1020 INPUT "WHAT IS THE STARTING ADDRESS (HEX)?";A$
1030 IF LEN (A$) = 0 THEN END
1040 GOSUB 5000
1050 IF F < 0 THEN 1000
1060 S = X
1070 PRINT
1080 INPUT "WHAT IS THE ENDING ADDRESS (HEX)?";A$
1090 IF LEN (A$) = 0 THEN 1000
1100 GOSUB 5000
1110 IF F < 0 THEN 1000
1120 LET E = X
1130 IF E < = S THEN PRINT CHR$(7);"THE END IS LESS THAN
    THE START!": GOSUB 5100: GOTO 1000
1140 PRINT
1150 PRINT "WHAT NAME DO YOU WANT TO USE ?"
1160 INPUT " ";A$
1170 PRINT CHR$(4);"BSAVE ";A$;" ,A";S;" ,L";E - S + 1
1180 END
5000 PRINT : PRINT "CONVERTING TO DECIMAL"
5010 LET F = 0:X = F
5020 FOR J = 1 TO LEN (A$)
5030 FOR I = 1 TO 16
5040 IF MID$ (A$,J,1) = MID$ (H$,I,1) THEN
    X = X * 16 + I - 1: F = F + 1
5050 NEXT I,J
5060 IF F < > LEN (A$) THEN F = - 1:"THAT'S NOT HEX!!!";
    CHR$(7): GOSUB 5100
5070 IF X > 2 ^ 16 THEN F = - 1: PRINT "THAT'S TOO BIG!!!";
    CHR$(7): GOSUB 5100
5080 RETURN
5100 FOR J = 1 TO 1000: NEXT J: RETURN
```

Applesoft: Mixing DOS and High-Res

Revised: 11/7/84
Security: Everyone

Applesoft: Mixing DOS and High-Res

=====

DOS uses two memory locations, \$26 and \$27, which are also used by Applesoft's High-Res routines during the HLOT TO X,Y statement. DOS commands mixed in with HLOT TO X,Y statements prevent the X,Y from plotting properly.

To enable mixing DOS with High-Res, you must save and restore the pointer. Statements 25 and 35 demonstrate how to maintain the pointer values.

This will not work

```
10 D$ = CHR$(4)
20 HLOT 1,2

30 PRINT D$;"CATALOG"

40 HLOT TO 33,44
```

This does work

```
10 D$ = CHR$(4)
20 HLOT 1,2
=> 25 A = PEEK(38): B = PEEK(39)
30 PRINT D$;"CATALOG"
=> 35 POKE 38,A: POKE 39,B
40 HLOT TO 33,44
```

Applesoft: Problems with user-defined functions and CHAIN

Revised: 11/7/84
Security: Everyone

Applesoft: Problems with user-defined functions and CHAIN

=====

User defined functions in Applesoft may cause problems when the CHAIN command is used. When Applesoft encounters a DEF FN statement, an entry is made in the simple variable table which points to the rest of the function in the text of the program. Strange and perhaps fatal things can happen if you use this function defined in the previous program without having the same image of the function at the same memory locations.

The easy way around this problem is avoid using defined functions, or re-define all of your defined functions in each of the chained modules.

First program:

```
5 REM PROGRAM 1
10 DEF FN A(X)=X*X
20 PRINT FN A(2)
30 PRINT CHR$(4);"BLOAD CHAIN,A520"
40 CALL 520"PROGRAM 2"
```

Second program:

```
5 REM PROGRAM 2
10 DEF FN A(X)=X*X
20 PRINT FN A(2)
30 END
```

Applesoft: Printing the 40-column text screen to a printer

Revised: 11/7/84
Security: Everyone

Applesoft: Printing the 40-column text screen to a printer

=====

Print the contents of the text screen with the following program. It uses the VTAB command to find the starting address of each line, then adds a character counter to index across the screen. This routine is easily included as a subroutine in an application program. (NOTE: This program will work for 40 columns only!)

```
10 FOR V = 1 TO 24
20  VTAB V
30  P = PEEK (40) + PEEK (41) * 256
40  FOR H = 0 TO 39
50    PRINT CHR$( PEEK (P+H));
60  NEXT H
70  PRINT
80 NEXT V
90 END
```

Decreasing the limits of V and H in lines 10 and 40 limits the program to send only part of the screen.

Applesoft: Documentation aids

=====

Finding subroutines easily helps you to modify and debug your programs. The following tricks may help you to see what's going on in your software.

The use of linefeeds (CTRL-J) as the first and last character in the text of your REMs (see example below) makes the text of the remark stand out. Some printers even place the remark at the left margin with the line numbers.

Using colons to indent FOR-NEXT loops makes them stand out, making it easier to identify those needing closing.

```
10 REM
    THIS STANDS OUT

20  FOR J = 1 TO 10
30  : FOR K = 1 TO 10
40  :: PRINT J * K
50  : NEXT K
60  NEXT J
```

Applesoft: PEEKs, POKEs, and CALLs

Revised: 1/20/87
Security: Everyone

Applesoft: PEEKs, POKEs, and CALLs

=====

To make Applesoft programs read data from memory, write data to memory, or pass control to machine language programs, programmers use Applesoft's PEEK, POKE, and CALL statements. Here is an explanation of each statement's function.

PEEK makes a program read a memory location. The format of the statement is PEEK (<memory location>) where <memory location> is a positive integer from 0 to 65535. Programmers use PEEK most commonly with a variable: X% = PEEK (2048) assigns the value located at 2048 to the integer variable X%.

POKE makes a program write a value to a memory location. The format of the statement is POKE <memory location>,<value> where <memory location> is a positive integer from 0 to 65535 and <value> is a positive integer from 0 to 255. Programmers use POKE most commonly to write data directly to memory: POKE 2048,128 assigns the value 128 to the memory location 2048.

CALL makes a program pass control to a machine language routine at some memory location. The format of the statement is CALL <memory location> where <memory location> is a positive or negative integer from -32768 to 32767 or a positive integer from 0 to 65535 (note that the signed integers from -32768 to 32767 represent exactly the same memory locations as the positive integers from 0 to 65535). Programmers use CALL most commonly used to invoke routines built into the Apple II's ROM. For example, the statement CALL -936 invokes the routine which clears the screen and homes the cursor (just like using Applesoft's HOME statement).

To change the screen display or make sounds and other special effects on the Apple II, Apple II Plus, Apple IIe, Apple IIc and Apple IIGS, Applesoft accesses various memory locations. Each particular CPU's reference manual includes a memory map where you can find the segments of memory used by text, graphics, Applesoft, the monitor and peripheral cards.

Apple-published memory locations remain the same for most members of the Apple II family; other internal locations may change. Therefore, to assure that your programs will work properly on all Apple II family computers, do not use entry points other than those printed in the Apple manuals.

Locations used to communicate with interface cards may be found in the manuals for those devices. For example, memory locations used by the Apple 80-column card are found in the 80-Column Text Card Manual and the Extended 80-Column Text Card Supplement.

Many computer and book stores sell books with listings of Applesoft, monitor ROM, DOS 3.3 and ProDOS memory locations. You may find the following publications useful:

- What's Where in the Apple by William Luebbert; Micro Ink.
- Beneath Apple DOS by Don Wirth and Pieter Lechner; Quality Software.
- Beneath Apple ProDOS by Don Wirth and Pieter Lechner; Quality Software.
- The Apple Almanac by Eric Goetz and Williams Sanders; Datamost, Inc.

					E		N								
							T								

The first two bytes are pointers to the absolute address of the beginning of the next line. The first byte is the least significant.

The next two bytes are integers representing the line number of that line. Again, the first byte is the least significant.

The next byte, a token, stands for the first Applesoft keyword. When the lines starts with "A = 1", the variable name (in ASCII) is first. The remaining command consists of keywords and symbols reduced to one byte tokens and unmodified ASCII text.

A list of Applesoft's tokens appears on page 121 of the Applesoft Reference manual.

The subsequent bytes are either "\$00"s signifying the end of this line, or "\$3A"s, indicating multi-statement lines, followed by a "\$00.

If the link field for a line is 00 00, then Applesoft considers it the last line in the program while running or listing. The SAVE command uses a different pointer for the end of the program. \$AF,B0 normally points to the high byte in the line number of the line beyond the last line.

Applesoft: Syntax error when the program is run

Revised: 11/7/84
Security: Everyone

Applesoft: Syntax error when the program is run

=====

Applesoft requires the first byte in the program storage area be zero. Some machine language programs don't leave a zero, causing Applesoft to react strangely.

Initialize that byte, even if the program memory pointer has been changed by:

```
POKE PEEK (103) + PEEK (104) * 256,0
```

Applesoft: Numeric comparison problems

Revised: 2/18/86
Security: Everyone

Applesoft: Numeric comparison problems

=====

When two numbers print as equal, though an IF statement indicates they're not, the least significant bits in the internal binary storage format of those numbers are different. Applesoft's PRINT statement truncates a number that is extremely close to being an integer. For example, 3^2 and $3*3$ will both print as 9 but won't compare as equal. Printing $3^2 - 3*3$ will result in 3.7252903E09, while the expression $3^2 = 3*3$ is false.

Round Applesoft real numbers to a specific number of decimal places to avoid comparison problems. Use the formula:

$$X = \text{INT}(X * P + .5) / P$$

where $P=10$ for 1 decimal place, $P=100$ for 2 decimal places and $P=1000$ for 3 decimal places, etc.

Applesoft: Understanding FRE(0)

Revised: 11/7/84
Security: Everyone

Applesoft: Understanding FRE(0)

=====

PRINT FRE(0) displays the amount of memory available for Applesoft variables. This value may be negative due to the way Applesoft handles integer numbers on 48K systems. Numbers greater than 32767 appear to have 65536 subtracted from them; in such a case, add 65536 to the value returned in order to get the number of free bytes. For example:

```
1000 PRINT FRE (0) - 65536 * (FRE (0) < 0)
```

PRINT FRE(0) can cause the Apple to hang when it's executed in command mode immediately after loading your program from a diskette or using Applesoft RENUMBER. This hang is due to the variable pointers not resetting properly. Type CLEAR before entering PRINT FRE(0) to return the expected results.

The following program checks the memory for string variables; however, it doesn't give the expected results.

```
10 DIM A$(100)
20 B$ = "ABC"
30 FOR I = 1 TO 100
40 A$(I) = B$
50 PRINT FRE (0) + 65536
60 NEXT I
```

Since B\$ is assigned to a string constant in line 20, and the pointer for A\$(I) is assigned B\$ (line 40), the PRINT statement in line 50 prints the same number. If we change line 40 to read:

```
40 A$(I) = B$ + "D"
```

the program uses memory for each assignment, because concatenation creates a new string in the free memory space each time the new line 40 is executed.

Applesoft: OUT OF MEMORY errors

Revised: 11/7/84
Security: Everyone

Applesoft: OUT OF MEMORY errors

=====

There are only two ways to run out of memory in Applesoft. The most common reason for this error is either that your program is too large or it's using too many variables. The solution: trim down your program, keep the data on a disk, or chain your program in from the disk in segments.

The less common cause of this error is stack overflow. This problem is easily spotted, since after you receive the OUT OF MEMORY error, PRINT FRE(0) will tell you that there is still free memory. The 6502 stack, though, which Applesoft uses to save its recursive subroutine calls, is a limited resource; it's this stack that your program is overloading. Your program is overloading this stack in one or more of the following ways:

1. Too many FOR-NEXT loops
2. Too many GOSUBs
3. Excessively complex mathematical or string functions
4. GOSUBs with no RETURN
5. Improper recovery in ONERR GOTO routines
6. CALLs or interrupts that don't restore the stack properly

The effects of these functions are cumulative, so a combination of them could be causing your error.

Items one through four commonly occur in very complex programs. If one or more of these items is the cause of your problem, you can implement a program-controlled restart by executing the Applesoft routine CALL 54915; this routine clears the stack without clearing the variables by eliminating all pending FOR-NEXT loops, GOSUBs and formulas. Items one through four, though, have to do with your program structure, so when your program is cleanly structured you shouldn't have problems overloading the 6502 stack.

If a stack overflow is caused by running a cleanly-structured program, then that implies that the overflow is being caused by items five and/or six.

If you're using ONERR GOTO, carefully read pages 81, 82 and 136 of the (green and white) Applesoft BASIC Programming Reference Manual. There are two correct ways to leave the ONERR GOTO routine: (1) use a RESUME so Applesoft can take

care of the stack and re-execute the statement that caused the error, or (2) use the stack recovery routine on page 82 or 136 before any GOTO statement. (The example on page 136 is easier to implement.) If you're using Applesoft in ROM, replace the routine on page 136 with CALL -3288 and no POKEs.

When Applesoft executes a CALL, it does a 6502 JSR to the specified address. Other routines, such as those that handle interrupts from a peripheral card, also involve the 6502 stack. It's up to you to leave the stack the way you found it--so if you use any of these routines, make sure that you remove any bytes the pushed onto the stack so that the 6502's internal registers are maintained.

Applesoft: Rounding and truncating floating-point numbers

Revised: 2/18/86
Security: Everyone

Applesoft: Rounding and truncating floating-point numbers

=====

Sometimes Applesoft's math package doesn't give the answer you expect because Applesoft calculations are done in a 32 bit binary floating point format, which have no exact equivalents to most numbers. Furthermore, Applesoft uses natural logarithms to calculate many of its transcendental functions, which adds small errors to the results.

To avoid comparison problems, round Applesoft real numbers to a specific number of decimal places. Use the formula:

$$X = \text{INT}(X * P + .5) / P$$

where P=10 for 1 decimal place, P=100 for 2 decimal places and P=1000 for 3 decimal places, etc.

Applesoft: VTAB notes

=====

VTAB statements move the cursor to a specific vertical position ignoring the current text window. A VTAB to a line above the text window starts writing as if the window were the whole screen until it scrolls into the window where it stays. This prevents the information above the window from scrolling. A VTAB below the window causes writing only on the line where the cursor is located, allowing normal scrolling within the window from carriage returns.

Applesoft: Random numbers

Revised: 11/7/84
Security: Everyone

Applesoft: Random numbers

=====

All numbers produced by running Applesoft's random number generator follow the same sequence as the first RUN, since the Applesoft's random number seed is not reinitialized. This seed number, stored in locations \$C9 to \$CD, is initialized when your system is first booted.

The Applesoft random number generator is only a pseudo-random generator (as are most generators); thus, non-random patterns eventually occur. The frequency these patterns repeat varies from program to program, though proper re-seeding of the random number generator helps prevent small repeating sequences. Here are two suggestions:

1. Use the monitor's random seed at locations 78 and 79 to initialize Applesoft's random number seed. Since the monitor's seed is constantly incrementing while waiting for a key to be pressed, you'll start on one of 65536 different sequences.

```
10 X = RND (-PEEK (78) - PEEK (79) * 256)
```

2. This random sequence can be lengthened by re-seeding the generator occasionally within the application program by adding the statement `X = RND (-RND (1))`.

No method completely eliminates patterns in the random numbers generated, but you can lengthen the sequences until they're difficult to detect.

Applesoft's algorithm is:

Multiply the random seed by 11879546.4.
Add the result to 3.92767778 E-08.
Swap the most and least significant bytes of the result.
Force the exponent into the 0..1 range.

The example below shows the effect of the algorithm on a number. The most and least significant two decimal digits are swapped instead of bytes in this example:

```
0.500000000
* 11879546.4
-----
5929773.2
+      0.0000000392767778
-----
5929773.2      (the rest is lost)
--   ---      swap "bytes"
3229775.9

0.32297759      force value between 0 and 1
```

Security: Everyone

Applesoft: Internals--Introduction (1 of 2)

=====

The following six notes, first published in The Apple Orchard (March 1980) are written for experienced 6502 machine language programmers who wish to use the Applesoft ROM subroutines. The addresses given are for an Apple II+ with an Applesoft firmware card, or Applesoft loaded into a Language Card. Consult your Applesoft Reference manual for more information.

Take special note of CHRGET, the heart of Applesoft. When Applesoft wants the next character of an instruction, it points TXTPTR at the program or input buffer, and JSRs to CHRGET. TXTPTR is temporarily set to the last used DATA statement when Applesoft READS DATA.

ABBREVIATIONS

msb: most significant bit or byte
lsb: least significant bit or byte
eol: end of line token (\$00)

A: the 6502 accumulator
X: the 6502 X register
Y: the 6502 Y register
Z: the zero flag of the 6502 status register
C: the carry flag of the 6502 status register

A,X is a 16 bit number where A has the msb and X the lsb.

(Y,A) is the number or string whose address is in Y and A, with the msb in Y and lsb in A.

FAC the floating point accumulator
ARG the ARGument register

Apple Tech Notes

Tech Info Library Article Number:72

Tech Info Library

Applesoft: Internals--TXTPTR routines (2 of 2)

Revised: 11/7/84
Security: Everyone

Applesoft: Internals--TXTPTR routines (2 of 2)

=====

CHRGET 00B1

CHRGET increments TXTPTR. Use CHRGOT to get the character. TXTPTR now points at:

CHRGOT 00B7

CHRGOT loads A from TXTPTR and sets certain 6502 status flags. X and Y are not changed. On exit:

A = the character currently pointed at by TXTPTR
Z is set if A is ":" or eol (\$3A or \$00)
C is clear if A is an ASCII number("0" to "9").

LINGET DA0C

LINGET read a line number (integer 0 to 63999) from TXTPTR into LINNUM. LINGET assumes the 6502 registers and A have been set up by the JSR to CHRGET that fetched the first digit. LINGET normally exits through CHRGOT, which fetches the character after the last digit. When the number is greater than 63999, LINGET exits via SYNTAX ERROR. LINNUM is zero when there is no number at TXTPTR.

GTBYTC E6F5

GTBYTC causes JSR to CHRGET to gobble a character, then evaluates the formula at TXTPTR, and then it returns a single byte integer in X and FACLO. On entry TXTPTR points to the first character of the formula. GTBYTC normally exits through CHRGET. If FAC is greater than 255 or less than 0, it exits through ILLEGAL QUANTITY ERROR.

GETBYT E6F8

GETBYT evaluates the formula at TXTPTR besides returning a single byte integer in X and FACLO. On entry, TXTPTR points to the first character of the formula. GETBYT normally exits through CHRGET. When FAC is greater than

255 or less than 0, it exits through ILLEGAL QUANTITY ERROR.

PLOTFNS F1EC

PLOTFNS gets two LORES plotting coordinates separated by a comma from TXTPTR (0-47,0-47). TXTPTR when entered, points to the first number of the formula. PLOTFNS puts the first number in FIRST and the second number in H2 and V2.

HFNS F6B9

HGNS gets HIRES plotting coordinates (0-279,0-191) from TXTPTR. TXTPTR points to the first character of the formula for the first number upon entry. HFNS leaves the 6502 registers set up for HPOSN. When exiting:

A = vertical coordinate
X = lsb of horizontal coordinate
Y = msb of vertical coordinate

Applesoft: Internals--Floating Point Math Package (1 of 3)

Revised: 11/7/84
Security: Everyone

Applesoft: Internals--Floating Point Math Package (1 of 3)

=====

Applesoft's floating point package provides a 9 digit scientific package for evaluating numeric equations. It supports trigonometric functions with arguments in radians, exponents and logarithms to base e.

ABBREVIATIONS

msb: most significant bit or byte
lsb: least significant bit or byte
eol: end of line token (\$00)

A: the 6502 accumulator
X: the 6502 X register
Y: the 6502 Y register
Z: the zero flag of the 6502 status register
C: the carry flag of the 6502 status register

A,X is a 16 bit number where A has the msb and X the lsb.

(Y,A) is the number or string whose address is in Y and A, with the msb in Y and the lsb in A.

FAC: the floating point accumulator
ARG: the ARGument register

REAL NUMBER FORMAT

The real number format used throughout Applesoft is: the exponent is a single byte signed number (EXP) in excess of \$80 form (the signed value has \$80 added to it); the mantissa is 4 bytes (HO,MOH,MO,LO); the binary point is to the right of the most significant bit. Since in binary floating point notation the msb is always 1, the number's sign replaces the msb when the number is stored in memory in packed form. The sign, though, is kept in a separate byte (SGN) when only bit 7 is significant. If the exponent is zero, the number is zero, although the mantissa isn't necessarily zero.

Examples:

	EXP	HO	MOH	MO	LO	SGN
--	-----	----	-----	----	----	-----

Packed format

-10	84	A0	00	00	00
10	84	20	00	00	00

FAC format

-10	84	A0	00	00	00	FF
10	84	A0	00	00	00	00

Arithmetic routine calling conventions for single argument functions (e.g., SGN, ABS or INT):

On entry the argument is in the FAC.

On exit the result is in the FAC.

Arithmetic routine calling conventions for two argument functions (e.g., FADD and FSUB):

On entry the first argument is in the ARG.

On entry the second argument is in the FAC.

On exit the result is in the FAC.

FLOATING POINT REGISTERS

NOTE: The TEMP locations may be used for other things when not used by the floating point math package.

	FAC	ARG	TEMP1	TEMP2	TEMP3	RND
EXP	9D	A5	93	98	8A	C9
HO	9E	A6	94	99	8B	CA
MOH	9F	A7	95	9A	8C	CB
MO	A0	A8	96	9B	8D	CC
LO	A1	A9	97	9C	8E	CD
SGN	A2	AA	(packed format)			

FLOATING POINT CONSTANTS

The following addresses point to useful numbers; they're packed and suitable for use by most of the arithmetic routines including CONUPK and MOVMF.

RND	00C9
-32768	E0FE
1	E913
SQR (1/2)	E92D
SQR (2)	E932
-1/2	E937
LN (2)	E93C
10	EA50
1000000000	ED14
1/2	EE64
LOG (2) base e	EEDB

$\pi/2$	F063
$\pi*2$	F06B
$1/4$	F070

Applesoft: Internals--Floating Point Math Package (2 of 3)

=====

FLOATING POINT REGISTER MOVE ROUTINES

MOVFM EAF9

Moves the number in memory Y,A points to into FAC. On exit A and Z reflect FACEXP.

MOV2F EB1E

Pack FAC and temporarily moves it into register 2. On exit A and Z reflect FACEXP.

MOV1F EB21

Pack FAC and moves it temporarily into register 1. On exit A and Z reflect FACEXP.

MOVML EB23

Pack FAC and move it into zero page area starting at X. On exit A and Z reflect FACEXP.

MOVMF EB2B

Pack FAC and move it into memory pointed to by Y,X. On exit A and Z reflect FACEXP.

MOVFA EB53

Move ARG into FAC. On exit A and Z reflect FACEXP.

MOVAF EB63

Move FAC into ARG. On exit A and Z reflect FACEXP.

CONUPK E9E3

Load ARG from memory pointed to by Y,A. On exit A and Z reflect FACEXP.

SUMMARY OF MOVES:

FAC	=>	(Y,A)	EB2B	MOVFM
FAC	=>	(0,X)	EB23	MOVML

FAC	=>	TEMP1	EB21	MOV1F
FAC	=>	TEMP2	EB1E	MOV2F
FAC	=>	ARG	EB63	MOVAF
ARG	=>	FAC	EB53	MOVFA
(Y,A)	=>	FAC	EAF9	MOVFM
(Y,A)	=>	ARG	E9E3	CONUPK

FLOATING POINT OPERATORS

The following routines require that A and Z reflect FACEXP. Even though FAC move routines set up A and Z, a LDA \$9D will insure their proper values.

FMULT E97F

Multiply the FAC by the number in memory pointed to by Y,A.

FMULTT E982

Multiply FAC and ARG. On entry A and Z must reflect FACEXP.

FDIV EA66

Divide the number in memory pointed to by Y,A by FAC.

FDIVT EA69

Divide ARG by FAC. On entry A and Z must reflect FACEXP.

FADD E7BE

Add the number Y,A points to in memory to FAC.

FADDT E7C1

Add FAC and ARG. On entry A and Z must reflect FACEXP.

FSUB E7A7

Subtract FAC from the number Y,A points to in memory.

FSUBT E7AA

Subtract FAC from ARG. On entry A and Z must reflect FACEXP.

TRANSCENDENTAL OPERATORS

FPWRT EE97

Raise ARG to the FAC power. On entry A and Z must reflect the value of FACEXP.

SQR EE8D

Takes the square root of FAC

LOG E941

Log base e of FAC

EXP EF09

Raise e to the FAC power

COS EFEA
Returns the cosine of the FAC in radians.

SIN EFF1
Returns the sine of the FAC in radians.

TAN F03A
Returns the tangent of the FAC in radians.

ATN F09E
Returns the inverse-tangent of the FAC in radians.

OTHER OPERATORS

SGN EB90
Modifies the value of the FAC depending on its value on entry. On exit:

FAC = 1 if FAC was greater than 0
FAC = 0 if FAC was equal to 0
FAC = -1 if FAC was less than 0

ABS EBAF
Absolute value of FAC. If FAC is less than 0 then FAC = -FAC.

INT EC23
Greatest integer value of FAC. Uses QINT and floats the result.

RND EFAE
Form a pseudo-random number in FAC and update RND at 00C9.

SIGN EB82
Set A according to the value of FAC. On exit:

A = 1 if FAC is positive
A = 0 if FAC = 0
A = FF if FAC is negative

FCOMP EBB2
Compare FAC and a packed number in memory pointed to by Y,A. On exit:

A = 1 if (Y,A) < FAC
A = 0 if (Y,A) = FAC
A = FF if (Y,A) > FAC

NEGOP EED0
FAC = -FAC

FADDH E7A0
Add 1/2 to FAC

DIV10 EA55
Divide FAC by 10. Returns positive numbers only.

MUL10 EA39

Multiply FAC by 10. Works for both positive and negative numbers.

Security: Everyone

Applesoft: Internals--Floating Point Math Package (3 of 3)

=====

LOWER LEVEL INTERFACE ROUTINES

FOUT ED34

FOUT creates an ASCII string in FBUFFR equivalent to the value of FAC. On exit Y,A points to the string, which ends with an ASCII null. FAC is scrambled. Use STROUT to print the number.

SNGFLT E301

SNGFLT converts the unsigned number in Y to a floating point number in FAC.

GIVAYF E2F2

GIVAYF converts the unsigned number in Y,A to a floating point number in FAC.

FLOAT EB93

FLOAT converts the signed number in A to a floating point number in FAC.

CONINT E6FB

CONINT converts FAC into a single byte integer in X and FACLO. CONINT normally exits through CHRGET unless FAC is greater than 255 or less than 0, when it exits via ILLEGAL QUANTITY ERROR.

AYINT E10C

If FAC is less than +32767 and greater than -32767, then execute QINT. Otherwise AYINT exits via ILLEGAL QUANTITY ERROR.

QINT EBF2

Quick greatest integer function. Leaves INT(FAC) in FACHO,MO,LO signed. QINT assumes that the absolute value of the FAC is less than 8388608 (2^{23} rd power).

GETADR E752

GETADR converts the number in FAC to a 2 byte, unsigned integer in LINNUM. When FAC is greater than 65535 or less than -65535, GETADR exits via ILLEGAL QUANTITY ERROR.

GETNUM E746

GETNUM fetches a 2 byte number, a comma and an unsigned, single byte number from TXTPTR. The first number is stored in LINNUM, while the second is returned to the X register. On entry TXTPTR points to the first character of the formula for the first number. GETNUM uses FRNUM, GETADR, CHKCOM and GETBYT.

COMBYTE E74C

COMBYTE checks for a comma, then fetches an unsigned, single byte number returned in X. On entry TXTPTR points to the comma. COMBYTE uses CHKCOM and GETBYT.

FRMEVL DD7B

FRMEVL evaluates the formula at TXTPTR using CHRGET, then leaves the result in FAC. On entry, TXTPTR points to the first character of the formula, while on exit points to the terminator. "A" does not contain the terminator. The format of the temporary result on the stack is:

 The address of the operator routine.

 The floating point temporary result.

 The precedence of the operator.

FRMEVL, the main subroutine for the commands that use formulas, works for both strings and numbers. If the formula is a string literal, FRMEVL gobbles the opening quote, then executes STRLIT and ST2TXT.

FRMNUM DD67

FRMNUM evaluates the formula at TXTPTR, puts it in FAC, then makes sure the result is numeric. On entry TXTPTR points to the first character of the formula. FRMNUM exits through TYPE MISMATCH ERROR if the result is a string.

FIN EC4A

FIN inputs a floating point number into FAC from CHRGET. FIN assumes the 6502 registers and A were set up by the CHRGET that fetched the first digit. FIN only operates on numeric constants, not formulas.

Applesoft: Internals--String Utilities (1 of 2)

Revised: 11/7/84
Security: Everyone

Applesoft: Internals--String Utilities (1 of 2)

=====

Applesoft strings have two parts: the descriptor and the ASCII string. Your string descriptor contains the length of the string along with the address of the string's first character. Refer to page 137 of the Applesoft Reference Manual for additional information on the string components. During most Applesoft routines the descriptor is left in memory, while a two byte pointer to the descriptor is kept in the FAC. The pointer is the address of the descriptor; therefore, the actual string could be anywhere in memory. The statement 10 A\$ = "HI" leaves a descriptor pointing to the program text.

STRINI E3D5

STRINI obtains space for creating a string whose descriptor is pointed to by FACMO/FACLO; it also creates a descriptor for it in DSCTMP. On entry A = length of the string, while FACMO/FACLO point to the string descriptor. STRINI uses GETSPA to force garbage collection when there isn't sufficient room; GETSPA exits with an "OUT OF MEMORY ERROR" when garbage collection free up enough room. GETSPA moves FRESPC and FRETOP down, making room to store the string. STRINI returns with the descriptor of the new string in DSCTMP and the original pointer in DSCPNT.

STRSPA E3DD

STRSPA obtains space for the creation of a string A bytes long, then creates a descriptor for it in DSCTMP. STRSPA uses GETSPA to force garbage collection when there isn't enough room. If garbage collection is unable to make sufficient room, GETSPA exits with an "OUT OF MEMORY" error. GETSPA moves FRESPC and FRETOP down enough to store the string, then returns A unchanged with the new descriptor in DCSTMP.

GETSPT DA7B

GETSPT moves the descriptor pointed to by FACMO/FACLO into the memory pointed to by FORPNT. GETSPT also moves the string's text up to FRETOP if it isn't in the program's text. GETSPT frees up the string if it was a temporary string. GETSPT uses GETSPA to initiate garbage collection, or alternatively "OUT OF MEMORY" error when the garbage collection doesn't free up sufficient

room.

MOVINS E5D4

Moves the string whose descriptor is pointed to by STRNG1 to memory pointed to by FRESPA.

MOVSTR E5E2

MOVSTR moves the string pointed to by Y,X with a length of A to memory pointed to by FRESPA.

Apple Tech Notes

Tech Info Library Article Number:77

Tech Info Library

Applesoft: Internals--String Utilities (2 of 2)

Revised: 11/7/84
Security: Everyone

Applesoft: Internals--String Utilities (2 of 2)

=====

STRTXT DE81

Build a temporary descriptor for a string literal of which the first character is pointed to by TXTPTR plus C and which ends with a quote. FACMO,FACLO points to the resulting temporary descriptor. Skip leading quotes before calling STRLIT. On exit, STRNG2 points to the character after the string literal.

STRLIT E3E7

Build a temporary descriptor for a string literal of which the first character is pointed to by Y,A and which ends with a quote. FACMO,FACLO points to the resulting temporary descriptor.

Skip leading quotes before calling STRLIT. On exit, STRNG2 points to the character after the string literal.

STRLT2 E3ED

Take a string literal of which the first character is pointed to by Y,A and build a temporary descriptor for it pointed to by FACMO,FACLO. Save in CHARAC and ENDCR the characters other than zero that terminate the string. Skip leading quotes before calling STRLIT2. On exit, STRNG2 points to the character after the string literal.

PUTNEW E42A

Move the descriptor in DSCTMP to a temporary descriptor, put a pointer to the descriptor in FACMO,FACLO, and flag the result as a string.

GETSPA E452

Get A bytes of memory below HIMEM for a string.

GETSPA forces garbage collection to make room in memory when necessary and exits with an "OUT OF MEMORY ERROR" if garbage collection can't make enough room.

GETSPA moves FRESPC and FRETOP down enough to store the string. On entry, A equals the number of characters. GETSPA returns with A unchanged and pointer to the space in FRESPC, FRETOP, and Y,X.

FRESTR E5FD

Make sure that the last FAC result was a string and free up the temporary string result. Check the descriptor for a temporary status allocated by

PUTNEW. On exit, the address of the string is in INDEX and Y,X. The length of the string is in A. Uses FRETMP.

FREFAC E600

Free up the temporary string pointed to by FACMO,FACLO. Check the descriptor for a temporary status allocated by PUTNEW. On exit the address of the string is in INDEX and Y,X. The length of the string is in A. Uses FRETMP.

FRETMP E604

Free up a temporary string. On entry the pointer to the descriptor is in Y,A. Checks the descriptor for a temporary status allocated by PUTNEW. If so, the temporary is freed up by updating TEMPPT. If a temp is freed up, a further check tests the string's location for the lowest in memory. If so, that area of memory is freed up by updating FRETOP. On exit the address of the string is in INDEX and Y,X. The length of the string is in A.

FRETMS E635

Free the temporary descriptor without freeing up the string. On entry Y,A point to the descriptor to be freed. On exit Z is set if anything was freed.

Applesoft: Internals--Device I/O Routines

Revised: 11/7/84
Security: Everyone

Applesoft: Internals--Device I/O Routines

=====

INLIN D52C

Input a line of text without sending out a prompt from the current input device into the input buffer, BUF. INLIN uses GDBUF to strip off the most significant bit on all input characters.

INLIN+2 D52E

Input a line of text prompting with the character in X from the current input device into the input buffer, BUF. INLIN uses GDBUF to strip off the most significant bit on all input characters.

GDBUFS D539

Puts a zero at the end of the input buffer, BUF, and masks off the msb on all bytes. On entry: X = the end of the input line.
On exit:

A = 0
X = FF
Y = 1

INCHR D553

Get one character from the current input device in A and mask off the MSB. INCHR uses the main Apple input routines and supports normal handshaking.

STROUT DB3A

Print string pointed to by Y,A. The string must end with a null or a quote.

STRPRT DB3D

Print a string whose descriptor is pointed to by FACMO,FACLO.

OUTDO DB5C

Print the character in A. INVERSE, FLASH, and NORMAL in effect.

CRDO DAFB

Print a carriage return.

OUTSPC DB57

Print a space.

OUTQST DB5A

Print a question mark.

INPRT ED19

Print " IN " and the current line number from CURLIN. Uses LNPRT.

LNPRT ED24

Prints the 2 byte unsigned number in X,A.

PRNTFAC ED2E

Prints the current value of FAC. FAC is destroyed. Uses FOUT and STROUT.

Applesoft: Internals--Miscellaneous Routines

Revised: 11/7/84
Security: Everyone

Applesoft: Internals--Miscellaneous Routines

=====

PTRGET DFE3

Read a variable name from CHRGET and find it in memory. On entry TXTPTR points to the first character of the variable name. On exit the address to the value of the variable is in VARPNT and Y,A. If PTRGET can't find a simple variable it creates one. If it can't find an array it creates one dimensioned from 0 to 10 and sets all elements equal to zero.

GETARYPT F7D9

Read a variable name from CHRGET and find it in memory. On entry TXTPTR points to the first character of the variable name. This routine leaves LOWTR pointing to the name of the variable array. If the array can't be found the result is an OUT OF DATA ERROR.

FNDLIN D61A

Searches the program for the line whose number is in LINNUM.

On exit:

C set LOWTR points to the link field of the desired line.

C clear then not found. LOWTR points to the next higher line.

DATA D995

Move TXTPTR to the end of the statement. Looks for the ":" or eol (0).

DATAN D9A3

Calculate the offset in Y from TXTPTR to the next ":" or eol (0).

REMN D9A6

Calculate the offset in Y from TXTPTR to the next eol (0).

ADDON D998

Add Y to TXTPTR.

SCRTCH D64B

The "NEW" command. Clears the program, variables, and stack.

CLEARC D66C

The "CLEAR" command. Clears the variables and stack.

STKINI D683

Clears the stack.

RESTOR D849

Sets the DATA pointer, DATPTR, to the beginning of the program.

STXTPT D697

Set TXTPTR to the beginning of the program.

BLTU D393

Block transfer makes room by moving everything forward.

On entry:

Y,A and HIGHDS = destination of high address + 1

 LOWTR = lowest address to be moved

 HIGHTR = highest address to be moved + 1

On exit:

LOWTR is unchanged

HIGHTR = LOWTR - \$100

HIGHDS = lowest address transfered - \$100

REASON D3E3

Makes sure there's enough room in memory for another variable. Checks to be sure that the address Y,A is less than FRETOP. May cause garbage collection. Causes "OUT OF MEMORY ERROR" if there's no room.

GARBAG E484

Move all currently used strings up in memory as far as possible. This maximizes the free memory area for more strings or numeric variables.

CONT D898

Moves OLDTEXT and OLDLIN into TXTPTR and CURLIN.

NEWSTT D7D2

Execute a new statement. On entry TXTPTR points to the ":" preceding the statement or the zero at the end of the previous line. Use NEWSTT to restart the program with CONT. THIS ROUTINE DOES NOT RETURN.

RUN D566

Run the program in memory. THIS ROUTINE DOES NOT RETURN.

GOTO D93E

Uses LINGET and FNDLIN to update TXTPTR. GOTO assumes that the 6502 registers and A have been set up by the CHRGET that fetched the first digit.

LET DA46

Uses CHRGET to get address of the variable, "=", evaluate the formula, and store it. On entry TXTPTR points to the first character of the variable name.

Applesoft: Internals--High resolution graphics routines

Revised: 11/12/85
Security: Everyone

Applesoft: Internals--High resolution graphics routines

=====

NOTE: Regardless of which screen is being displayed, HPAG (location \$E6) determines onto which screen the software draws graphics. (\$20 for HGR, \$40 for HGR2)

HGR2 F3D8
Initialize and clear page 2 High-Res.

HGR F3E2
Initialize and clear page 1 High-Res.

HCLR F3F2
Clear the current High-Res screen to black.

BKGND F3F6
Clear the current High-Res screen to last plotted color.

HPOSN F411
Positions the High-Res cursor without plotting. HPAG determines which page the cursor is pointed at.
On entry:
Horizontal = Y,X
Vertical = A

HPLLOT F457
Call HPOSN then try to plot a dot at the High-Res cursor's position. The dot may not be plotted if plotting non-white at a complementary color X coordinate.

HLIN F53A
Draws a line from the last plotted point or line destination to the coordinate in the 6502 registers.
On entry:
Horizontal = X,A
Vertical = Y

HFIND F5CB

Convert the High-Res cursor's position to X-Y coordinates. HFIND allows the user to tell where on the screen the a shape table left the cursor.

On exit:

\$E0 = horizontal lsb

\$E1 = horizontal msb

\$E2 = vertical

DRAW F601

Draw the shape pointed to by Y,X using the current HCOLOR starting at the current High-Res cursor position. On entry A = rotation factor.

XDRAW F65D

Draw the shape pointed to by Y,X by starting at the current High-Res cursor position inverting the existing color of the dots the shape draws over. On entry A = rotation factor.

SETHCOL F6EC

Set the High-Res color to X. X must be less than 8.

SHLOAD F775

Loads a shape table into memory from tape above MEMSIZ (HIMEM) and sets the pointer at \$E8.

Applesoft: Internals--Error Processor Routines

Revised: 11/7/84
Security: Everyone

Applesoft: Internals--Error Processor Routines

=====

ERROR D412

Checks ERRFLG and jumps to HNDLERR if ONERR is active. Otherwise it prints
<cr> "?" <error message pointed to by X> "ERROR". If this is during program
execution then it also prints " IN " and the CURLIN.

HANDLERR F2E9

Saves CURLIN in ERRLIN, TXTPTR in ERRPOS, X in ERRNUM, and REMSTK in ERRSTK.
X contains the error code. See the Applesoft Reference Manual page 136 for
the value of X for a given error.

RESUME F317

Restores CURLIN from ERRLIN and TXTPTR from ERRPOS and transfers ERRSTK into
the 6502 stack pointer.

ISCNTC D858

Checks the Apple keyboard for a CTRL-C (\$83). Executes the BREAK routine
if there is a CTRL-C.

CHKNUM DD6A

Make sure FAC is numeric. See CHKVAL.

CHKSTR DD6C

Make sure FAC is a string. See CHKVAL.

CHKVAL DD6D

Takes the result of the most recent FAC operation and check this result for a
string or numeric variable. A TYPE MISMATCH ERROR results if FAC and C don't
agree.

On entry:

C set checks for strings

C clear checks for numerics.

ERRDIR E306

Causes ILLEGAL DIRECT ERROR if the program isn't running. X is modified.

ISLETC E07D

Checks A for an ASCII letter ("A" to "Z"). On exit C set if A is a letter.

PARCHK DEB2

Checks for "(", evaluates a formula, and checks for ")". Uses CHKOPN and FRMEVL then falls into CHKCLS.

CHKCLS DEB8

Checks at TXTPTR for ")". Uses SYNCHR.

CHKOPN DEBB

Checks at TXTPTR for "(" . Uses SYNCHR.

CHKCOM DEBE

Checks at TXTPTR for ", ". Uses SYNCHR.

SYNCHR DECO

Checks at TXTPTR for the character in A. TXTPTR is not modified. Normally exits through CHRGET. Exits with SYNTAX ERROR if they don't match.

Revised: 11/7/84
Security: Everyone

Applesoft Reference Manual: Errata (1 of 2)

=====

Page 5

Paragraph 4, the last line should read: However, only the first 9 digits are usually significant, and the tenth digit is rounded off.

Page 15

Line 90 should read:

```
90 DIM A(8): REM DIMENSION ARRAY WITH MAX. 9 ELEMENTS
```

Page 15

Line 180 should read:

```
180 IF A(I) <= A(I+1) THEN GOTO 240
```

Page 21

The line about mid-page that reads

C\$ = RIGHT\$(B\$,3) + "-" + LEFT\$(B\$,4) + "-" + MID\$(B\$,6,7) should read

C\$ = RIGHT\$(B\$,4) + "-" + LEFT\$(B\$,4) + "-" + MID\$(B\$,6,7)

Page 23

Line 180 should read:

```
180 I = I+1: IF I < 15 THEN GOTO 130
```

Page 51

If TAB(X) is the last item in a PRINT statement Applesoft will act as if there is a semi-colon after it.

Page 52

If SPC(X) is the last item in a PRINT statement Applesoft will act as if there is a semi-colon after it.

Page 53

FRE returns the amount of memory ... Applesoft sometimes stores duplicate strings separately.

Page 53

PRINT FRE (0) sometimes returns a negative number because of the way integers are handled in Applesoft. Adding 65536 to the negative number will give the

positive representation.

Page 63

Rule 2 should read "The total number of elements RECALled must be at least equal to" instead of "...equal th".

Page 66

Similarly, a response... If an ASCII NUL character, CTRL-SHIFT-P, is included in a line of input, the input will be truncated at the character before the NUL. A NUL as the first character in response to INPUT A\$ will result in a null string. A NUL as the first character in response to INPUT A will result in ?REENTER.

Page 66-67

A line of input longer than 255 characters will be cancelled by the monitor and the user is left in the input statement. A line greater than 239 but less than 255 will be truncated to 239 characters.

Page 81

ONERR GOTO, "When an error occurs..." should read "After executing an ONERR GOTO command, when an error occurs...".

Page 96

Paragraph 1, line 6, the sentence that starts "Press the RESET key..." should read "Type CALL -151" because Apple IIs with the Auto-Start ROM will not go into the monitor when the RESET key is pressed.

Page 102

The function for LOG of X base 10 is $\text{LOG}(X) / \text{LOG}(10)$.

Page 118

"1) Use multiple statements" states that the maximum line number is 65529 when the actual maximum line number is 63999.

Page 131

Second paragraph, line 7, replace "POKE 22,W" with "POKE 33,W".

Applesoft Reference Manual: Errata (2 of 2)

=====

Page 135

Replace the top part with

260 POKE -16296,0

Clear game control "annunicator" output #0 (Game I/O connector, pin 15) to TTL low (0.3 volts). This is the "off" condition: maximum current 8 milliamperes.

270 POKE -16295,0

Set game control "annunicator" output #0 (Game I/O connector, pin 15) to TTL high (3.5 volts). This is the "on" condition: maximum current 0.4 milliamperes.

280 POKE -16294,0

Clear game control "annunicator" output #1 (Game I/O connector, pin 14) to TTL low (0.3 volts). This is the "off" condition: maximum current 8 milliamperes.

290 POKE -16293,0

Set game control "annunicator" output #1 (Game I/O connector, pin 14) to TTL high (3.5 volts). This is the "on" condition: maximum current 0.4 milliamperes.

300 POKE -16292,0

Clear game control "annunicator" output #2 (Game I/O connector, pin 13) to TTL low (0.3 volts). This is the "off" condition: maximum current 8 milliamperes.

310 POKE -16291,0

Set game control "annunicator" output #2 (Game I/O connector, pin 13) to TTL high (3.5 volts). This is the "on" condition: maximum current 0.4 milliamperes.

320 POKE -16290,0

Clear game control "annunicator" output #3 (Game I/O connector, pin 12) to TTL low (0.3 volts). This is the "off" condition: maximum current 8 milliamperes.

330 POKE -16289,0
Set game control "annunicator" output #3 (Game I/O connector, pin 12) to TTL high (3.5 volts). This is the "on" condition: maximum current 0.4 milliamperes.

Applesoft Tutorial: Errata

Revised: 11/7/84
Security: Everyone

Applesoft Tutorial: Errata

=====

Page 6

References to the RESET key need to refer to CTRL-RESET for newer Apples.

Page 17

"STOPPING THE COMPUTER"; Pressing RETURN after a CTRL-C may be required if the Apple is waiting for input from the keyboard.

Page 23-24

There are only five different elementary arithmetic operations. They are:

- + Addition
- * Multiplication
- Subtraction
- / Division
- ^ Exponentiation

Page 37

GAMEPOINTS = 45 won't work because it contains the key word, INT. It will be parsed as GAMEPO INT S and it will return a SYNTAX ERROR. GAMEPTS = 45 should be OK.

Page 38

The line before the last listing should say "Try the statements below in order:" instead of "Try the statements on the next page in order:"

Page 59

Line 230 at the bottom of the page should read:
230 IF N < = 10 THEN GOTO 210

Page 63

Line 270 should read:
270 X = X / 7

Page 65

Line 3220 should read:
3020 COLOR = N

Page 69

The last line on the page reads:

```
120 PRINT "THE STRIKES AND BALLS ARE ";STRIKES;" ";BALLS
```

It is difficult to tell this because the space after STRIKES;" comes at the end of the line of listing.

Page 71

Lines 650 and 660 are reversed. They should read:

```
650 NEXT Y
```

```
660 NEXT X
```

Page 79

The two example line 780s are incorrect. The word "BACKGROUND" will be parsed as "BACK GR OUND" because GR is a key word and because there is already a variable BALL which would share the same Applesoft variable name, BA. Try using "FIELD" instead.

Page 81

Paragraph 3, "One possible solution is given on the next page," should read "One possible solution is given below,"

Page 85

Line 220 has an extra "). It should read:

```
220 COLOR= INT (16 * RND(1))
```

Page 95

The program will give incorrect values for the Y variable unless a time delay is installed. Add this line: 1005 FOR J = 1 TO 10: NEXT J

Page 96

Line 360 should read:

```
360 FOR S = 0 TO 1: REM 2 LINES, FROM Y AND Y + 1
```

Page 105

Replace line 120 with

```
120 WHOLE$ = HALF$ + " " + OTHERHALF$
```

Page 108

According to page 99 and iii, the title on this page should read "INTRODUCING ARRAYS: DIM".

Page 109

The last sentence in the last paragraph should read "The program below accomplishes this."

Page 109

Line 340 should read:

```
340 TEMP = GLASS(WINE):GLASS(WINE) = GLASS(MILK):GLASS(MILK)
    = TEMP
```

Page 110

Starting in the middle of the 9th line, the text should read; "Then line 320 makes sure that the value of WINE is not equal to the value of MILK at any

given time. The contents of variables GLASS(WINE) and GLASS(MILK) are switched in line 340. Finally the array is printed with lines 370 through 390."

Page 130

Clear the entire screen should be press <ESC> then <SHIFT> and <P@> instead of <CTRL> and <P@>.

Page 148-149

The green keys should have slashed zeros to differentiate them from capital O.

Applesoft: A program to simulate PRINT USING

Revised: 9/5/85
Security: Everyone

Applesoft: A program to simulate PRINT USING

=====

The listing below demonstrates how Applesoft can simulate the BASIC statement PRINT USING.

This particular example shows a subroutine that formats numeric output into a "Dollars and Cents" format. It's simple and fairly fast. It assumes that the calling program has initialized the following:

X, containing the number to be printed,
N, containing the number of digits to the right of the decimal, and
S, containing the width of the right justified printing field

The subroutine starting at line 1000 does all the work.

```
100 REM PRINT USING SIMULATOR
130 REM
140 LET N = 2: REM SET NUMBER OF DECIMALS
160 LET S = 5: REM SET FIELD WIDTH
180 HOME
190 FOR X = - 5 TO 5 STEP .501
200 PRINT X,"$";
210 GOSUB 1000
220 NEXT X
230 PRINT
240 PRINT "UNFORMATTED      FORMATTED"
250 END
1000 LET X$ = " " + STR$(INT(X * 10^N +.5))
1010 LET Q = LEN(X$) - (VAL(X$) < 0)
1020 PRINT SPC(S - Q * (Q > N+1) - (N+2) * (Q <= N+1));
1030 PRINT MID$(X$,1 + (VAL(X$) < 0), (Q <= N) + (Q-N) * (Q > N));
1040 PRINT MID$( "0.00", 1 + ((N+1) < Q), 1 + (N-Q+2) * (Q < N+2));
1050 PRINT RIGHT$(X$, N * (Q > N) + (Q-1) * (Q <= N));
1060 RETURN
```

Applesoft: Internals--Page Zero Memory Map (1 of 2)

```
=====

00-02  START  Initialize low RAM memory
03-05  RDYJSR  Jumps to STROUT
06,07  ADRAYI  Address of AYINT subroutine
08,09  ADRGAY  Address of GIVAYF subroutine
0A-0C  USRPOK  Vector for USR() function
0D     CHARAC  String delimiter
0E     ENDCHR  String delimiter
0F     COUNT  General purpose counter
10     DIMFLG  Flag to permit arrays
11     VALTYP  Variable type indicator. 0=numeric, 1=string
12     INTFLG  Variable type indicator. 1=integer, 0=real
13     GARBFL  Flag to signal the need for garbage collection
14     SUBFLG  Flag to permit array variables.
15     INPFLG  Determines if this is INPUT or READ
16     TANSGN  Used for the sign during TAN() function
1A,1B  SHAPE   High-Res shape pointer
1C     HCOLOR1 High-Res running color mask
1D     COUNTH  High-Res counter
26,27  HBAS    High-Res base address pointer
2C     H2
2D     V2
45     ERROV
50,51  LINNUM  16 bit integer work area
53,54  LASTPT  Pointer to last used string temporary
55-5D  TEMPST  Temporary string descriptor storage area
5E,5F  INDEX   General purpose index
60,61  INDEX2  General purpose index
62-66  RES     Multiply or divide result (HO,MOH,MO,LO)
67,68  TEXTAB  Pointer to start of the program text
69,6A  VARTAB  Pointer to start of simple variable space
6B,6C  ARYTAB  Pointer to start of array variable space
6D,6E  STREND  Pointer to end of storage in use
6F,70  FRETOP  Pointer to top of string free space
71,72  FRESPC  Pointer to new string
73,74  MEMSIZ  Pointer to top of memory
75,76  CURLIN  Current line number
```

77,78	OLDLIN	Old line number, set up by ctrl-C, STOP, or END
79,7A	OLDTXT	Old text pointer
7B,7C	DATLIN	Line number where data for next READ comes from
7D,7E	DATPTR	Pointer to data for next READ
7F,80	INPPTR	Pointer to where input is coming from
81,82	VARNAM	Storage area for a variable's name
83,84	VARPNT	Pointer to a variable in memory
85,86	FORPNT	Variable pointer for FOR and LET
87,88	OPPTR	Pointer to current formula operation in OPTAB
89	OPMASK	Mask created by current operator
8A,8B	DEFPNT	Pointer used in function definition
8C,8D	DSCPNT	Pointer to a string descriptor
8E	TEMPF3	Temporary pointer
8F	FOUR6	Constant for garbage collection
90-92	JMPER	Internal vector
93	TEMPF1	Temporary pointer
94,95	ARRYPT	Pointer into an array
94,95	HIGHDS	Destination of highest element in BLT.
96,97	HIGHTR	Source of highest element to move in BLT.
98	TEMPF2	
99,9A	LOWDS	Location of last byte transferred into in BLT.
9B,9C	LOWTR	Last thing to move in BLT. See BLTU.
9D-9F	DSCTMP	Temporary string descriptor
9D-A2	FAC	Floating point accumulator. (EXP,HO,MOH,MO,LO,SGN)

Applesoft: Auto RUN byte and protecting programs

Revised: 11/7/84
Security: Everyone

Applesoft: Auto RUN byte and protecting programs

=====

A byte in memory causes any Applesoft command entered from command mode to be interpreted as a RUN command.

POKE 82,213
SAVE

causes this automatic RUN byte to be set when the program is loaded from tape. This "protection" scheme is very easy to defeat, and is not widely used. It does not protect the program from DOS commands.

POKE 214,128

sets the auto-run byte from command mode or from within a program. Take care with this POKE because there is no way to reverse it from command mode because the next POKE will RUN the program.

POKE 214,0

from within a program will return the auto-run byte to normal.

Applesoft: Commas and printing

=====

The following information applies to the Apple II Plus with a 40-column screen.

The third comma tab field is only available if there is nothing beyond column 23. The first character in the third comma field can print outside the text window.

HTAB can force the cursor outside the text window which can kill a program on the next PRINT statement.

VTAB ignores the text window. VTABbing below the text window will cause all output to be on one line. VTABbing above the text window will scroll into the window but the area above the window won't scroll.

AppleWorks: Converting PFS:File & PFS:Write Files to AppleWorks

Revised: 9/1/87
Security: Everyone

AppleWorks: Converting PFS:File & PFS:Write Files to AppleWorks

=====

This article last reviewed: 9/1/87

Here are several ways to convert Pascal-based PFS:Write and PFS:File files to AppleWorks.

PFS:Write

The ProDOS version of PFS:Write includes a conversion program called PFS:Convert, which lets you convert Pascal-based PFS files to the new ProDOS PFS:Write format. Once you've made this conversion, start the ProDOS version of PFS:Write and load the file you want to transfer to AppleWorks. From the PFS:Write Main Menu, save the file using the suffix ".TXT." PFS:Write will now save the file as a standard ASCII file stripped of formatting commands except line breaks. Now you can start AppleWorks, and use the "Make a new document for the Word Processor" function and type in the file's pathname. You will have to reformat the document.

The Pascal PFS Conversion Disk also converts Pascal PFS:Write and PFS:File documents to ProDOS (ASCII) files. Jim Luther, 5716 Forest, Kansas City MO 64110.

The March 1986 issue of Call-A.P.P.L.E. contains a conversion program that you can either type yourself, or download from the A.P.P.L.E. Crate Bulletin Board (206) 251-0543. Call-A.P.P.L.E., 290 S. W. 43rd Street, Renton WA 98055, 206/251-5222.

PFS:File

If your PFS:File records fit within AppleWorks' limits (number of categories and fields) no special preparation is necessary. If you have more categories, than AppleWorks allows, you'll have to decide which are not vital and delete them. If you have fields longer than 76 characters, AppleWorks should truncate the additional characters, but AppleWorks versions earlier than 1.3 don't always do so.

After using the PFS:Convert program that comes with the ProDOS version of

PFS:File, use the "Copy Selected Forms to An ASCII File" in the ProDOS PFS:File program, enter the prefix and file name for the new ASCII text file. When the ASCII options menu is displayed, choose a number between 1 and 30 for the "End of item code" and a different number for your "End of form code." PFS:File will convert the file, although somewhat slowly. Now you can start AppleWorks, Make a New file for the Data Base, and Make a new file from a text (ASCII) file. Enter the path name for the file you are about to import. At the prompt, tell AppleWorks how many categories were in each PFS:File record. Give the file you are creating a name and Press Return; AppleWorks will create a database. A word of caution: if you are working with 5.25" disks, you must split PFS files larger than 30K into smaller files.

Jim Luther's Pascal PFS Conversion Disk performs the conversion, but it has some limitations: it takes data only from the first page of PFS:File form, drops any categories after the 30th, and truncates any entries in a category in excess of 78 characters.

The June 1986 issue of Call-A.P.P.L.E. contains another program by Wes Felty, PFS:File to ProDOS ASCII Converter, which you can type yourself or download from the A.P.P.L.E. Crate Bulletin Board.

A commercial program called Bridge converts Pascal PFS:File documents to a DOS 3.3 DIF sequential text file, or to one formatted for DOS 3.3 AppleWriter II. It converts entire PFS:File forms without limitations by the page or the form or the number or length of the categories. Once the file is converted to standard DOS 3.3, you must bring it over to ProDOS with Apple's ProDOS Utilities, System Utilities, or other conversion program. Sun Microsystems, Inc., P. O. Box 1388, Fort Lauderdale, FL 33302, 305/486-6115.

Another Pascal PFS:File to ProDOS conversion method involves the ProFiler program. There are two ProFiler utility programs used to convert PFS:File records to ProFiler records. One program works with Pascal PFS:File records, the other with ProDOS PFS:File records. You can batch process the conversion from PFS by using an Exec file adapted for your own use from a public domain diskette (No. 34) available from TAWUG, The AppleWorks Users Group, P. O. Box 24789, Denver, CO 80224-0869, or you can write to Don Lancaster c/o Computer Shopper for a hardcopy of the program (include a self-addressed stamped envelope). ProFiler is from PM Software, P. O. Box 1788, 17610 Beach Boulevard, Suite 29, Huntington Beach CA 92647, 714/963-2221.

Applesoft: Using the monitor MOVE Routine

Revised: 11/7/84
Security: Everyone

Applesoft: Using the monitor MOVE Routine

=====

The MOVE subroutine in the monitor will not work directly from an Applesoft CALL because Applesoft doesn't assure the presence of a zero in the 6502's Y register and the MOVE subroutine must have the zero there to work. Here is a program that shows a way around this problem:

```
10 DEF FN M(X) = X - INT (X/256) * 256
20 POKE 768,160                      (LDY #0 )
30 POKE 769,0
40 POKE 770,76                      (JMP MOVE)
50 POKE 771,44
60 POKE 772,254
100 REM DO THE MOVE
110 START = 20000                    Start of memory to be moved
120 QUIT = 21000                     End of memory to be moved
130 DEST = 30000                     Start of destination
140 POKE 60,FN M(START)
150 POKE 61,START / 256
160 POKE 62,FN M(QUIT)
170 POKE 63,END / 256
180 POKE 66,FN M(DEST)
190 POKE 67,DEST / 256
200 CALL 768
```

Applesoft: Tips on error handling

=====

When using ONERR GOTO, you have two correct ways to leave your ONERR routine:

1. You can use RESUME; with this, Applesoft re-executes the statement that caused the error, or
2. you may use a GOTO after executing a CALL -3288. For details on this call and on error handling in general, please refer to pages 66 and 67 of the Applesoft BASIC Programmer's Reference Manual, Vol. 2 (p/n A2L4031).

LaserWriter: Creating a Prep File

Revised: 7/26/89
Security: Everyone

LaserWriter: Creating a Prep File

=====

This article last reviewed: 5 July 1989

This article describes how to create a LaserPrep file. You can put this file at the beginning of any Macintosh-generated Postscript file (one created with a Command-F after clicking the OK button on the print dialog box). This technique includes an option which allows printing in fonts other than Courier. Follow these steps:

1. Capture the LaserPrep header by pressing Command-K after clicking the OK button on the print dialog box.
2. To use the header from another computer, edit it as follows:
 - a. Search for the first Control-d and delete everything that follows (that's the PostScript description of the document you printed).
 - b. Comment out (%)
 1. The line near the beginning of the file that contains a "setscinteractive" command
 2. The line starting with the "waittimeout" command
 3. The note command
 4. The long hex string near the end of the file
 5. The line before the "eexec" command
 - c. To keep everything from being printed in Courier, add the following lines:

```
%!  
% fontprep.ps
```

```
md begin
/scratch 100 string def
FontDirectory {
  pop scratch cvs dup 0 get dup 65 lt exch 90 gt or {
    pop %% ignore any font name that doesn't start with a letter
  }{
    %% set up and call the /rf routine in md dictionary:
    dup length string copy /#nm exch def
    #nm length 7 add string
    dup 0 (|_____) putinterval
    dup 7 #nm putinterval cvn
    dup FontDirectory exch known {
      clear
    }{
      #nm cvn dup
      fondfont /Encoding get StandardEncoding eq
      {true} {false}ifelse
      rf %stack /_____Fontname /Fontname <boolean>
    }ifelse
  }ifelse
}bind forall
end %md
```

d. If you don't want LaserPrep permanently loaded each time you ship it to the printer, comment out

1. The "exitserver" line
2. The first line of the file (probably all zeros, the exitserver password).

If you want to print in a variety of fonts, see the font code addendum in the article "LaserWriter: How to Print all Fonts".

Applesoft: About the LOMEM command

Revised: 11/7/84
Security: Everyone

Applesoft: About the LOMEM command

=====

The LOMEM command in Applesoft can be used to relocate the addresses where Applesoft stores its variables in memory. LOMEM is automatically set to the top of the program when the LOAD command is executed.

After LOAD				
		Program text	High-Res & Variables	DOS
		-LOMEM		
		-TEXTAB		-HIMEM
			-LOMEM	
After LOMEM				
		Program text	High-Res	Variables DOS
		2048	8192	16384
			or 16384	24576

Most commonly, users employ LOMEM when a short program's variables collide with the High-Res screen memory. Employ the statements below depending on which page of High-Res you use, HGR or HGR2:

For HGR
10 LOMEM: 16384

For HGR2
10 LOMEM: 24576

LOMEM executes a CLEAR, so you must call it before any variables are defined.

WARNING: the CHAIN program that comes with DOS 3.3 will reset LOMEM to the end of the program.

Take note that LOMEM moves the addresses of the variables but it does not move

the address of the program. Another pointer, TEXTAB, tells Applesoft where to start loading the program. The following programs relocate the program and variables above the High-Res buffers by changing TEXTAB. DOS and CHAIN will continue to load programs there until the system is re-booted or the FP command is executed.

For HGR

```
10 POKE 103,1           : REM THIS CHANGES
20 POKE 104,64          : REM TEXTAB TO 16385
30 POKE 16384,0         : REM (NEEDED BY APPLESOFT)
40 PRINT CHR$(4);"RUN PROGRAM"
```

For HGR2 or both pages

```
10 POKE 103,1           : REM THIS CHANGES
20 POKE 104,96          : REM TEXTAB TO 24577
30 POKE 24576,0         : REM (NEEDED BY APPLESOFT)
40 PRINT CHR$(4);"RUN PROGRAM"
```

Note: Modifying TEXTAB can be dangerous. The DOS RUN command employs an Applesoft NEW to re-initialize the rest of Applesoft's pointers. Cassette users will have to type "NEW" from the keyboard before loading their programs. Failure to do a NEW will cause unpredictable results.

Apple II Hardware: Direct Memory Access (2/97)

Revised: 3/3/97
Security: Everyone

Apple II Hardware: Direct Memory Access (2/97)

Article Created: 21 September 1984
Article Reviewed/Updated: 28 February 1997

TOPIC -----

This article describes DMA (Direct Memory Access) and how it can be used to control the Apple's memory and I/O.

DISCUSSION -----

DMA (Direct Memory Access), is designed to allow the hardware on an interface card to completely take over the Apple's memory and I/O. The DMA pin on the Apple II interface bus disconnects the Apple's 6502 from the Apple's address bus, data bus, R/-W signal, and clock. The DMA pin should be pulled low immediately after phase 0 goes low and should be released when phase 0 again goes low. The 6502 is a dynamic device that will lose its registers' memory if DMA is held low for more than 40 microseconds. Here is an example where the DMA lasts for two microseconds.

The 6502 normally sets up its addresses, control, and data while clock 0 is low. The memory or I/O device decodes and readies the data while clock 0 is high. The actual transfer occurs when clock 0 goes from high back to low. During cycles when DMA is low, the user must supply the address, control, and data information for that memory cycle in synchronization with the Apple's clocks.

Enabling Unlimited DMA

- * Point the reset vector to a restart routine, assuming the Apple has the Auto-Start ROM.
- * Have the peripheral card generate a RESET when the 6502 is to have control of the bus. The Apple II Reference Manual explains the RESET vector starting on page 36.

Apple II: Interrupt Handling (2/97)

Revised: 3/3/97
Security: Everyone

Apple II: Interrupt Handling (2/97)

Article Created: 21 September 1984
Article Reviewed/Updated: 28 February 1997

TOPIC -----

This article describes interrupt handling routines in the Apple II.

DISCUSSION -----

The user should be familiar with the 6502 interrupt requirements as defined in the Synertek Programming and Hardware manuals. This article applies to the interrupt request (IRQ). The use of the non-maskable interrupt (NMI) in a disk system is not recommended. The data and programs on the disk may be destroyed if an NMI occurs while the Apple is writing data to the disk. The DOS disables IRQ during critical code making it relatively safe to use.

HARDWARE

For interrupts, the Apple peripheral slots have defined three pins:

IRQ, Interrupt ReQuest	pin 30
INT IN, daisy chain in	pin 28
INT OUT, daisy chain out	pin 23

The daisy chain structure allows an interface card to disable the next higher number card from requesting an interrupt. Slot 0 has the highest priority and slot 7 has the least.

The system was designed so that if INT IN for a slot is low then that slot may not generate an interrupt. Each slot should pull INT OUT low when it is requesting an interrupt to disable lower priority slots. Cards that don't use IRQ should wire INT IN and INT OUT together so that any higher priority slots can still disable cards in lower priority slots. This priority system fails if there is an empty slot between any two interrupting cards.

The hardware logic required to generate INT OUT is INT IN anded with the active low interrupt signal from the peripheral device. IRQ is INT IN anded with the active high interrupt signal from the peripheral device.

SOFTWARE

There are two ways to cause the 6502 to follow the IRQ vector. A logical zero on the IRQ pin of the 6502 while the IRQ flag of the processor is cleared, or executing a BREAK instruction in a program:

First, the Apple monitor determines whether a BREAK or an IRQ has occurred. In the Auto start ROM, this routine is at \$FA40 and in the old monitor it's at \$FA86. This routine stores the 6502 accumulator at location \$45 and retrieves the processor status flags. A BREAK drops into the monitor with the address of the BREAK operation code + 2 and a dump of the 6502 registers. The Auto-Start ROM has the option of jumping to a user's routine after a break. Both monitor ROMs jump to the address contained in memory at \$3FE and \$3FF after an IRQ.

Interrupt Request

The user must have the address of his interrupt handler stored in \$3FE and \$3FF before the first interrupt is generated.

Caution: The accumulator does not contain valid data when it is vectored to \$3fe and \$3FF.

The accumulator must be restored from location \$45 before the return from interrupt instruction, (RTI) is executed. The user must also be careful to leave the other registers as they were when an interrupt occurred.

Interrupts and BASIC

If the user is careful to restore all the 6502 registers and not disturb BASIC's memory locations in the interrupt handling routine, the interrupt will be transparent to BASIC. Be very careful of page 0 locations. Save and restore any information on the stack when you're not sure.

Applesoft and Integer BASIC both use the 6502 stack extensively in keeping track of GOSUBs and FOR-NEXT loops. This makes it difficult to have an interrupt modify BASIC program execution. To do this the easiest way, program the interrupt routine to set a flag byte when an event occurs and then program the BASIC program to PEEK that flag byte's address and respond when the flag byte is set.

You may use the Applesoft ONERR GOTO statement to modify the execution of an Applesoft program when the interrupt occurs. The following machine language routine causes an 'error' condition in Applesoft.

```
10 POKE 800,162: POKE 801,100: POKE 802,104: POKE 803,104
20 POKE 804,104: POKE 805,76 : POKE 806,233: POKE 807,242
30 POKE 1022,0 : POKE 1023,8
40 ONERR GOTO 1000
50 PRINT "NO INTERRUPT"
60 GOTO 50
1000 IF PEEK (222) <> 100 THEN END
1010 PRINT "INTERRUPT!!!"
1020 RESUME
```

The POKES set the IRQ vector to generate an error number 100 when an interrupt occurs. The Applesoft onerr routine can check decimal location 222 and if it doesn't equal 100 then you have a normal Applesoft or DOS error. Treat the IRQ generated error like any other Applesoft error. RESUME and the routine on page 82 of the Applesoft reference manual will work normally. Please do a search on ON ERR GOTO for more information.

Interrupts and DOS

The interrupt checking routine in the monitor saves the 6502 accumulator at location \$45 while it checks for a break. Unfortunately, DOS also uses location \$45 as temporary storage while DOS parses the numeric parts of its commands. This can result in range errors or reading the wrong record, slot, or drive if an interrupt occurs during parsing. There is no way around this problem at this time. To use interrupts with DOS in the safest way, disable IRQ when doing any disk access.

LaserWriter: Retention of the image on the printing drum

Revised: 5/1/87
Security: Everyone

LaserWriter: Retention of the image on the printing drum

=====

There is no image left on the drum between printings as indicated by signals to the hardware from the microcomputer on the DC controller board.

When the printer is ready to print, it is in standby mode. Upon receipt of a Print command from the interface board, the DC controller initiates an Initial Rotation (INTR) sequence powering up the corona assemblies and starting the main and scanner motors, the preconditioning exposure lamps, and the main motor, which rotates the drum. The printer then goes through all the motions necessary to print.

Then the DC controller initiates a Last Rotation (LSTR) sequence. This rotates the drum once after printing to prepare the drum for the next printing. If a Print command is received during LSTR, the printer cycles back into INTR. If a Print command is not received during LSTR, the drum continues rotating, delivering the paper and removing any residual charge from the drum.

System 4.1: Incompatible With Adobe Fonts

=====

This article last reviewed: 8 November 1988

The Font Initializer software that keys Adobe's downloadable fonts to a particular printer is incompatible with the Universal System (4.1) release. Font Initializer bombs with various ID='s during launch.

For those who have already upgraded to the Universal System (4.1/5.5), and need to install new Adobe downloadable fonts, there is a workaround. Start up with the System file on the initializer disk, which is 3.2/5.3, and proceed with the initialization. Then restart with the newer System, and the font will be there, ready to use.

Macintosh: Specifications on Network Voltages and DTR

=====

Article Created: 1 May 1987
Article Last Reviewed: 19 June 1992
Article Last Updated:

Some networks, such as an Ungerman Bass Net One network, require approximately 12 volts for the DTR signal (pin 20). In some configurations, the Macintosh Plus only supplies 2.25 volts.

It is possible the application in the configuration is not handling DTR properly. The removal of the +5 and +12 volt lines from the serial port on the Macintosh Plus means that a Macintosh application may have to control a peripheral's DTR line, which may be the problem. The program holding DTR low could contribute to this particular low voltage condition.

Consider also the more likely possibility that the IC that drives the handshake lines (a 9636 Line Driver) may not be able to source - or sink - enough current for the network. The IC will only supply or accept 150mA of current. If the existing hardware configuration of the network requires more than that, the IC will go into current limit, and the output voltage will drop to a level acceptable for the IC. This short circuit output voltage may very well be 2.5V. If this is the case, then a current booster of some sort may be necessary.

Apple Extended Keyboard: Specifications (Discontinued)

=====

Article Created: 4 December 1989
Article Reviewed/Updated: 25 June 1992

TOPIC -----

Here are the specifications for the Apple Extended Keyboard II.

DISCUSSION -----

Description:

The "Apple Extended Keyboard II" is the replacement for the existing Apple Extended Keyboard (M0115). In addition to the features of the existing keyboard, the Apple Extended Keyboard II provides a foot to adjust the height of the keyboard and a double-sided template to label the function keys.

Packing List (M0312):

- Apple Extended Keyboard II
- 1.0 m (3 ft.) ADB cable
- Double-sided template to place over function keys
- Owner's guide
- Warranty statement

System Requirements:

Any Apple personal computer with an Apple Desktop bus interface

Technical Specifications:

- Total 105 keys, including
 - 18-key numeric pad
 - 15 function keys
 - 4 arrow cursor-control keys in inverted T-style layout
 - 6 cursor-control keys (Home, Page Up, Page Down, Forward Delete, End,

and Help)

Size and Weight:

Front Height:	0.75 in. (19 mm)
Rear Height:	1.6 in. (41 mm)
Keyboard angle:	14 degree maximum 6 degree minimum
Width:	18.7 in. (475 mm)
Depth:	7.7 in. (195 mm)
Weight:	4.8 lbs (1.8 kg)

Product Details:

The keyboard has 15 function keys (F1-F15) and 6 cursor-control keys (home, Page Up, Page Down, Forward Delete, End, and Help).

F1-F4 are labeled on the housing under the keys F1=undo, F2=cut, F3=copy, and F4=paste. These are not predefined default values; however, developers are being encouraged to use these definitions as appropriate. The remaining 11 function keys can also be defined by the user. A template is provide for users to mark the key's function.

The remapping facility is available for a specific application or globally for all applications.

The function keys are operative by using a macro utility program or by using an MS-DOS application with the appropriate coprocessor card.

The Caps Lock LED is operative in the Macintosh environment. The Num Lock and Scroll Lock are not operative except by using an MS-DOS application with appropriate coprocessor card. Developers are being encouraged to support these LED's in their applications.

The keyboard has an adjustable foot in the rear of the keyboard. The height of the keyboard is adjusted with a lever in the rear of the keyboard. It can be adjusted with a tilt from the unextended 6 degree to a maximum of 14 degrees from horizontal.

Printing from the IBM PC Using LaserWriter PostScript

Revised: 3/4/90
Security: Everyone

Printing from the IBM PC Using LaserWriter PostScript

=====

This article last reviewed: 7 August 1989

If you are attempting to print to a LaserWriter from an IBM PC, you may have accomplished this in the past through the serial port with a buffer or spooler that allows XON/XOFF handshaking to your LaserWriter in Diablo 630 mode.

But if you want to take advantage of downloadable and optional fonts, scaling, and graphics, you need something that uses the LaserWriter's native PostScript commands. Here are some software packages that support LaserWriter PostScript:

- Microsoft Chart, Microsoft Windows, Microsoft Word
- Word Perfect
- Personal Publisher
- XY Write III

For multiple systems in a network, PC MacBridge from Tangent Technologies and TOPS by Centram are networks that supply a converter to allow IBM PC document files to print to LaserWriters on the network in PostScript format. An added feature of PC MacBridge is the network's ability to transfer specific application files between systems on the network.

You can also get your IBM PC document to print by using MacLink Plus from DataViz running on a Macintosh connected to your IBM PC. It will convert specific files for you and place them on the Macintosh for printing to a LaserWriter.

Macintosh: Font Sizes

=====

When using the Font D/A Mover, you may notice that some fonts show a different memory size, depending on what version of system file you're accessing. The fonts distributed by Apple have not actually changed in size; rather, a FOND resource was added to the System file with the introduction of the LaserWriter Plus. When the Font D/A Mover calculates the size of a font in bytes, the FOND resource for that font is also included. If you need to know a font's actual size, use ResEdit and do a Get Info for the font.

AppleWorks: Time-saving tips

=====

Article Created: 1 May, 1987

Article Change History

01/19/93 -Updated Vendor information
•Beagle Brothers now Word Perfect Corporation

1. A quick way to duplicate fields is the use an Open-Apple-" (quotation mark). Select the multi-record layout, position the cursor directly underneath the field with the information that you want to duplicate and press Open-Apple ". Hold the keys down to automatically update several fields.

Remember that you can also use the Open-Apple V (Standard Value) function to automatically fill in fields with input that you specify.

2. Open-Apple Q: This command will display all files that are currently on the desktop and allows you to choose any file quickly with the cursor or the keyboard. (Hint: This is also a excellent method of avoiding having to press Escape several times when you wish to change Printer Options from several folder levels down.)
3. Plan Ahead: Whenever you create a new DataBase file, create several "dummy" fields and label them 1,2,3, etc. Then, if you decide later to add a category, you won't lose all your report formats.
4. Open-Apple Tab backs up one field.
5. Open-Apple Y: Deletes from the cursor to the end of the current line or field.
6. Transferring "values only" from one spreadsheet to another is tricky. One way is to print to a DIF file the section that you want to transfer. Create a new spreadsheet from the DIF file and then cut and paste the values into your final spreadsheet from the one created

with the DIF file.

7. "Some Cells were Lost.....": Have you ever seen this message? You'll generally run into this message when you are copying cells in the far right hand section of an AppleWorks spreadsheet. AppleWorks versions 1.1 thru 1.3 allocate 2K of RAM for formulas and formatting information per row; the error message indicates that you have run out of the memory reserved for this purpose. There are two workarounds:
 - a. you can re-organize the spreadsheet in a vertical fashion, making it "taller" instead of "wider", or
 - b. you can upgrade to AppleWorks 2.0. The new version of AppleWorks reserves 10K of RAM for formulas and formatting information.
8. Label Printing: If AppleWorks isn't recognizing your form size, follow these steps:
 - a. From the main menu, select number 5, "Other Activities".
 - b. Select number 7, "Specify information about your printer(s)". You should now see a menu entitled "Printer Information".
 - c. Under the heading "Change printer specifications", select the name of the printer you want to use.
 - d. Change item number 2, "Accepts top-of-page commands", to NO.
9. Need to print two or three up labels? Try MacroWorks from Beagle Brothers (now WordPerfect Corporation). MacroWorks also adds Macro capability to AppleWorks.
10. Want to learn more about AppleWorks? "The Main Menu" is a specialty Newsletter exclusively for AppleWorks users. For more information call (800) 258-5473. A subscription is \$49.97 per year.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

Apple Modem: Testing the connection to the system

Revised: 8/3/89
Security: Everyone

Apple Modem: Testing the connection to the system

=====

There are two simple ways to test the connection between the Apple Modem and an Apple II, Apple II Plus, or Apple IIe system:

--To test the connection between the modem and an Apple Super Serial Card: From BASIC, type IN#(slot number) Return, Control AT Return, ATZ Return. The modem should send back the characters OK to the monitor. To test the modem, you can type ATL Return to set the modem in loop back test mode.

--To test the connection between the modem and a non-Apple Serial card: From Basic, type PR#(slot number) IN#(slot number) ATL Return. The modem should now be in loop back test mode.

Mail List Manager: Converting data files to Apple Writer III

Revised: 11/21/84
Security: Everyone

Mail List Manager: Converting data files to Apple Writer III

=====

Mail List Manager (Apple Writer III, versions 1.0 and 1.1) doesn't physically remove 'deleted' records from the MLMDATA file--it simply stops 'seeing' them. For instance, say you have seven records in your MLMDATA file:

1
2
3
4
5
6
7

Then, you delete records 3 and 5; those records are still there, but they can no longer be seen. The list now looks like this:

1
2
3 (invisible)
4
5 (invisible)
6
7

A problem arises, however, if you try to convert this MLMDATA file to an Apple Writer III file using the Apple Writer III Utilities conversion program. Since Mail List Manager knows about five remaining records, it tells Utilities to convert five records--and so Utilities converts the first five records, including the two 'deleted' ones. Records 6 and 7 are ignored.

A way around the problem:

When ready to convert to Apple Writer III

1. Merge Mailing List to another diskette (this will get rid of the deleted records).

2. Convert to Apple Writer III file with Apple Writer III Utilities.

Apple Writer III: Problems with underlining

Revised: 3/4/85
Security: Everyone

Apple Writer III: Problems with underlining

=====

Whenever a word to be underlined is the first word in a line, a problem occurs if the previous line ends exactly at the rightmost margin: the backslash to start underlining is ignored, and underlining begins instead at the next backslash--the one that should mark the END of the underline. To work around this problem, alter the text before the first backslash to prevent the previous line from ending exactly at the right margin.

A problem also occurs if the word or phrase to be underlined has a period or comma right after it. Remember that the backslash that toggles underlining generates a space--so if you type

\Underline this phrase\, but not this one...

you'll end up with a space before the comma. The only way to prevent this problem is to type

\Underline this phrase,\ but not this one...

which, unfortunately, underlines the comma too.

Apple Writer III: Installing Under Catalyst 2.0

Revised: 10/8/84
Security: Everyone

Apple Writer III: Installing Under Catalyst 2.0

=====

To get Catalyst 2.0 to access either Apple Writer III 2.0 or Apple Speller III on a ProFile, you must install them using a special data disk obtained from Quark. This disk comes with instructions on installing these Apple packages correctly.

Apple Technical Communications

Tech Info Library Article Number:121

Tech Info Library

AppleWorks: Installing it on a ProFile or UniDisk 3.5

Revised: 2/5/86
Security: Everyone

AppleWorks: Installing it on a ProFile or UniDisk 3.5

=====

Briefly, these procedures require you to:

1. Install PRODOS and BASIC.SYSTEM on the ProFile or UniDisk 3.5.

This can be done using the ProDOS User's Disk and instructions in the ProDOS User's Manual.

2. Copy all the files on the AppleWorks Startup and Program disk into a subdirectory named AppleWorks on the ProFile or UniDisk 3.5.

After this you will be able to boot and run AppleWorks from the ProFile or UniDisk 3.5.

I. Equipment Needed:

A. Apple IIe or Enhanced IIe

B. ProFile Hard Disk (5 or 10 Meg) with Apple II ProFile interface card or UniDisk 3.5 with UniDisk 3.5 interface card

-- Put the ProFile or UniDisk 3.5 interface card in slot 7 of an Enhanced IIe if, when you turn on the Enhanced IIe, you want it to boot from the ProFile or UniDisk 3.5 instead of the floppy disk drive

C. ProDOS User's Disk

D. AppleWorks Startup and Program disk

II. Installation Procedure:

A. Boot the ProDOS User's Disk.

B. Format the ProFile with the volume name /PROFILE or Format the UniDisk 3.5 with the volume name /UNI.

C. Use the File handling commands on the ProDOS User's disk to:

1. Copy the files PRODOS and BASIC.SYSTEM to the ProFile or UniDisk 3.5.
2. Create a subdirectory called APPLEWORKS on the ProFile or UniDisk 3.5
3. Copy all the files on the AppleWorks Startup and Program disks into the APPLEWORKS subdirectory you just created.
4. Remove the files PRODOS and BASIC.SYSTEM only from the subdirectory named APPLEWORKS.

-- You already put PRODOS and BASIC.SYSTEM on the root directory of the ProFile or UniDisk 3.5 in step C1.

D. Exit the ProDOS User's disk into Applesoft BASIC.

You need to create a program called STARTUP on the ProFile or UniDisk 3.5. This program will command AppleWorks to run from the ProFile or UniDisk 3.5 when you boot from the ProFile or UniDisk 3.5.

E. Type PR#n, where n is the number of the slot of the ProFile or UniDisk 3.5 interface card, e. g., PR#7 in the case of the Enhanced IIe in item IB above.

F. You should now have the] symbol on the screen. Type in the following program for the ProFile:

```
10 TEXT : HOME
20 PRINT CHR$(4);"PREFIX /PROFILE/APPLEWORKS"
30 PRINT CHR$(4);"-APL.WORKS.SYSTEM"
40 END
```

For a UniDisk 3.5, type in the following program:

```
10 TEXT : HOME
20 PRINT CHR$(4);"PREFIX /UNI/APPLEWORKS"
30 PRINT CHR$(4);"-APL.WORKS.SYSTEM"
40 END
```

G. Save this program on the ProFile or UniDisk 3.5 as STARTUP, i.e. SAVE /PROFILE/STARTUP or SAVE /UNI/STARTUP.

H. Type PR#n using the same number for n as you did in step E above.

-- AppleWorks should now boot from the ProFile or UniDisk 3.5.

I. To set up AppleWorks for use with the ProFile or UniDisk 3.5:

..TIL00122-AppleWorks-Installing_it_on_a_ProFile_or_UniDisk_3-5.pdf

1. In AppleWorks, choose 5. "Other Activities."
2. Then choose 1. "Select standard location of data disk."
3. Type /PROFILE/APPLEWORKS or /UNI/APPLEWORKS.

Pascal: Sending Output to the Printer

Revised: 10/8/84
Security: Everyone

Pascal: Sending Output to the Printer

=====

Here is an example of printing to both screen and printer from a Pascal program. Without the delay procedure, everything would appear to happen at once, so we have it in the program only to improve the sense of sequence during execution.

```
program PRINT_OUTPUT;
  var OutFile: text;

  procedure DELAY;
    var Count: integer;
  begin
    for Count := 1 to 2000 do
      end; {Delay}

begin
  rewrite (OutFile, 'printer:'); {Declare the printer}
                                {as a file.}
  writeln ('This is a test.');
```

{Output goes to the screen.}

```
  DELAY;
  writeln (OutFile, 'This is a test.');
```

{Output goes to}

{the printer.}

```
  DELAY;
  writeln ('This goes to the screen.');
```

```
  DELAY;
  writeln (OutFile, 'This goes to the printer.');
```

```
  close (Outfile) {Close the file ".printer" and end.}
end. {Print_Output}
```

To change devices, simply change the "PRINTER:" in the REWRITE statement to the name of the output device. The program APPLE3:DISKIO is an example of writing to a disk file.

Apple Pascal can have as many as ten files open for input and output at one time; "OutFile" is only one. Additional files can be declared with additional REWRITE statements.

..TIL00123-Pascal-Sending_Output_to_the_Printer.pdf

Because Pascal treats output as a file, both of these examples work with Apple II and Apple III Pascal.

To transfer a text file to the printer, use the Filer "T" function. For example, to print the contents of GRAFDEMO.TEXT (found on APPLE3:), type "T", followed by "APPLE3:GRAFDEMO.TEXT,PRINTER:". (Don't include the quotation marks.) The directory of APPLE3: can be printed out by typing "E", followed by "APPLE3:,PRINTER:".

Apple IIC: Description of Video Expansion Port

Revised: 10/8/84
Security: Everyone

Apple IIC: Description of Video Expansion Port

=====

The back panel of the Apple IIC has a DB-15 connector for sophisticated video interfaces external to the computer. See the table below for a description of signals.

In the table, the column labeled Deriv indicates from which clock signals the video signals are derived. LDPS, CREF and PRAS have a maximum delay of 30ns from the appropriate 14MHz rising edge. SEROUT is clocked out of a 74LS166 by the rising edge of 14M and has a maximum delay of 35ns. VIDD7 is driven from a 74LS374 and has a maximum delay of 28ns from the rising and (if 80 column) falling edges of phase1.

To align CREF so it is in the same phase at the beginning of every line, certain clock signals must be stretched. This stretch is for one 7M cycle (140ns), and occurs at the end of each video line. All timing signals except 14M, 7M and CREF are stretched.

WARNING!!! The signals at the DB-15 on the Apple IIC are not the same as those on the Apple III. Do not attempt to plug a cable intended for one into the other.

WARNING!!! Several of these signals, such as 14MHz, must be buffered within about four inches (10 cm) of the back panel connector - preferably inside a container directly connected to the back panel.

The Video Expansion Connector Pinouts

Pin	Deriv	Name	Description
1	phase1	TEXT	Video text signal from TMG; set to inverse of GR, except in double high-resolution mode
2		14M	14M master timing signal from the system oscillator
3	Q3	SYNC*	Display horizontal and vertical synchronization signal

from IOU pin 39

4	PRAS	SEGB	Display vertical counter bit from IOU pin 4; in text mode indicates second low-order vertical counter; in graphics mode indicates low-resolution
5		1VSOUND	One-volt sound signal from pin 5 the audio hybrid circuit (AUD)
6	14M	LDPS*	Video shift-register load enable from pin 12 of TMG
7	PRAS	WNDW*	Active display area blanking; includes both horizontal and vertical blanking
8		+12 V	Regulated +12 volts DC.; can drive 350mA
9	14M	PRAS*	RAM row-address strobe from TMG pin 19
10	PRAS	GR	Graphics mode enable from IOU pin 2
11	14M	SEROUT*	Serialized character-generator output from pin 1 of the 74LS166 shift register
12		NTSC	Composit NTSC video signal from VID hybrid chip
13		GND	Ground reference and supply
14	phase0	VIDD7	From 74LS374 video latch; causes half-dot shift if high
15	14M	CREF	Color reference signal from TMG pin 3; 3.58MHz

WARNING!!! Use caution. The maximum allowable current drain of +12V regulated power at the video expansion connector is 300 milliamps. If the external device draws more than this it can damage the computer or cause the power supply to shut down.

Apple Writer II: DOS Version--Recovering Lost Text Files

Revised: 10/8/84
Security: Everyone

Apple Writer II: DOS Version--Recovering "Lost" Text Files

=====

At times you run the risk of saving a short text file over a text file of greater length. You might, for instance, save the empty Apple Writer editor workspace with the same name of a valuable document. This prevents the system accessing the original contents of the file. While the data is still on the diskette, you have made it unaccessable to the system. This program accesses the data so that the system may recover your original file. This program has been tested on Apple Writer II and Apple Writer IIe files. It works with standard DOS Text files, signified by a T in the left margin of a catalog listing. This program does not operate with the ProDOS version of Apple Writer.

```
10 TEXT : NORMAL : HOME
20 INPUT "ENTER THE FILE NAME TO BE READ ";F$
30 INPUT "FIRST BYTE TO READ ";C
40 ONERR GOTO 200
50 D$ = CHR$(4)
60 PRINT D$;"OPEN "F$","L1"
70 PRINT D$;"OPEN NEW";F$
80 B$ = ""
90 PRINT D$;"READ "F$,"R";C
100 GET A$
110 C = C + 1
120 IF (ASC (A$) = 13) GOTO 170
130 B$ = B$ + A$
140 PRINT
150 IF (LEN (B$) > 254) GOTO 170
160 GOTO 90
170 PRINT : PRINT D$;"WRITE NEW";F$
180 PRINT B$
190 GOTO 80
200 PRINT : PRINT D$;"CLOSE ";F$
210 PRINT D$;"CLOSE NEW";F$
220 END
```

1. Type in the program and save it on your DOS disk. Run it.

2. After the program requests the name of the file that is to be recovered, type in the name giving slot and drive specifications in necessary--e.g., MYFILE, S6, D2.
3. Next the program prompts you for the first byte that you want to read from the file. You type in a number which should be:
 - a. an integer between 1 and 32768
 - b. the size, in bytes, of the file that was accidentally saved plus 1.

To find the size of this accidentally saved file, [L]oad it under Apple Writer. The size of the file is displayed on the data line after the length entry Len:. Add one to this count and type in the result.

4. Once you have typed in your information, give the program time to run and write the entire file. To read part of the file and then write the new file, the program may go back to the drive several times, so please be patient. The cursor will come back to the screen when the program is finished.

AppleWorks 2.0: Spreadsheet functions @AND and @OR

Revised: 10/20/86
Security: Everyone

AppleWorks 2.0: Spreadsheet functions "@AND" and "@OR"

=====
"@AND" and "@OR" test each value specified as an argument. They require a list of 2 or more arguments. While not necessarily, they usually are used with @IF: "@IF(@OR(A17>56,A18=0),.25,.333333)".

@AND takes any number of arguments, each of which must be a logical value or a range of logical values. Its value is 1 if all of the arguments are not 0; its value is 0 if any of the arguments are 0.

Syntax:

@AND(value:operand:value, value:operand:value)

Example:

@AND(A3>4,C5<4)

@OR takes any number of arguments, each of which must be a logical value or a range of logical values. Its value is 1 if any of the values is not 0; its value is 0 if all of the values are 0.

Syntax:

@OR(value:operand:value, value:operand:value)

Example:

@OR(A3>4,C5<4)

Using U.S. Apple Equipment Internationally (10/96)

Revised: 10/10/96
Security: Everyone

Using U.S. Apple Equipment Internationally (10/96)

Article Created: 21 September 1984
Article Reviewed/Updated: 10 October 1996

TOPIC -----

This article contains information on using U.S. Apple products outside the United States.

In the following context, using a product "internationally" means using it in a country with electrical power different from that of the country of manufacture. In determining whether a particular product can be used internationally, there are three classes, depending on whether a product accepts a range in voltage, frequency or both:

1) Universal

These products can be used internationally out of the box. Some of Apple's products are self-configuring devices or "universal" within a certain range. They can accept a range in both voltage and frequency, and only require a plug adapter for the specific locale.

Example: The Quadra 800 accepts 100-240 volts, 47-63 Hz.

2) Frequency Independent

These products can be used internationally with a voltage transformer. Generally they are geared for U.S. 120 volt power, but are flexible as to the frequency they accept (for example, 47-63 Hz), and are known as "frequency independent." These products need a stepdown isolation transformer to adapt the voltage, and will handle the different frequency on their own.

Examples:

The U.S. Performa 200 accepts 120 volts, 47-63 Hz.

Performa Displays use a switching power supply which works independent of the input frequency. The European input frequency standard of 50 hz will not adversely affect these monitors. You can use the Performa

Displays overseas with a voltage converter (isolation transformer.)

3) Frequency Dependent

These products generally cannot be used internationally. These are products that can work only within a narrow range in frequency; they are "frequency dependent." Transformers only transform voltage, so if the product requires a certain frequency, there's no practical way to convert both voltage and frequency.

These products can ONLY be used internationally in countries with the same frequency as the country for which the product was manufactured. Further, a voltage transformer will be required if the destination country has a voltage different from the home country.

Example:

The U.S. Apple Color OneScanner accepts 108-132 volts, 58-62 Hz.

****IMPORTANT NOTE**** Computers with power outlets for peripherals do not condition the voltage as it passes through. So, for example, a monitor requiring 120v-60Hz power could not be used in a 220v-50Hz environment even if the computer from which it gets its power is able to accept the local power.

This article also includes transportation, service, repair, and warranty tips.

Contents

- 1) Universal Devices
- 2) Voltage-dependent Devices
- 3) Frequency-dependent Devices
- 4) Service and Repair Tips
- 5) Traveling Tips

DISCUSSION -----

This article provides general information on using products outside the United States. If you want to find the electrical specifications of any specific piece of Apple hardware, refer to the Tech Info Library articles:

Electrical Specifications: Apple Computers (1 of 2) TECHINFO-0000267

Electrical Specifications: Apple Peripherals (2 of 2) TECHINFO-0020361

1) UNIVERSAL DEVICES

The majority of Apple products manufactured after the Macintosh SE are self-configuring or "universal" between 100v and 240v, 50-60Hz. To use them in countries within the range, a plug adapter should be all that is needed. Note that some Apple products have a voltage selector to select between 110 or 220 volts.

To verify if a specific product is universal, check the FCC ID label for the voltage requirements or the previously mentioned Electrical Specifications

articles.

2) VOLTAGE-DEPENDENT DEVICES

The Apple products designed to operate at a line voltage ranging from 107V to 137V at 50 or 60Hz (cycles per second) are considered to be voltage-dependant. If the destination country uses a line voltage of 220v, and the product only accepts 120v, you'll need a 220v to 110v stepdown isolation transformer. This type of transformer is the only one known to give a clean signal. Although converters are available in the U.S., there are reports that these devices have damaged some Apple products.

The transformer's wattage should be 150% of the total wattage of the system (computer, monitor, hard disk, printer, and so on). For example, if the system pulls 250 watts of power, use a transformer rated for a minimum of 375 watts. A 500-watt unit should be sufficient for an entire Apple system (CPU, monitor, and printer). The unit must have a third prong for a grounded outlet. Electrical shock to you or damage to the hardware may occur if the units are not grounded.

Non-universal Apple power supplies function correctly with voltages between 107V and 132V. If line voltage fluctuates outside these specifications, you'll need to use a power conditioner to ensure uninterrupted operation of your Apple equipment. Operating without the conditioner will probably not result in damage to the hardware, although the voltage fluctuation may cause your system to crash. In such an event, you'll lose any data in memory and may even lose data stored on the disk.

3) FREQUENCY-DEPENDENT DEVICES

If the country uses a line frequency other than 60Hz, then all AC-powered devices attached to your computer system (monitors, printers, plotters, hard disks, and so on) must be "frequency independent." That is, they must be able to operate on a line frequency of either 50 and 60Hz. A majority of Apple products are frequency independent, but check the specifications of all equipment prior to using them.

4) SERVICE AND REPAIR TIPS

As of April 5, 1993, an Apple warranty is valid in any country in which Apple sells products. A defective unit may be returned to any Authorized Apple Service Provider worldwide for service under warranty.

There are advantages to buying the products where they'll be used. Although mouse devices, external drives, digital boards, and similar modules are the same as distributed in the U.S., the software and keyboards are different for each country. Further, having the entire workstation dependent on a single transformer is risky. If it fails and passes native current through to voltage and/or frequency dependent products, serious damage will result.

If you intend to take your Apple product with you, it is advisable that you buy

and use the product well before your departure. Heavy use often turns up any problems that would have come up at more inconvenient times while traveling.

5) TRAVELING TIPS

When traveling with a computer in the U.S. or overseas, protect it from shock, heat, moisture, radiation, and theft. Special hard-shell shipping cases are advertised for most Apple systems and these protect the machines from environmental abuse. They often do not look like computer cases, and as such usually escape the notice of thieves.

X-rays and other magnetic radiation associated with X-ray machines only pose a slight potential danger; there have been no reports of ROM damage and only isolated reports of software media damage from these causes. Some airports X-ray all luggage; if the risk in losing software is too high, plan your travel logistics after you find out which airports will hand-check the computer.

Due to concern about computers and floppy disks going through security scanners at airports, the American Society for Testing and Materials (ASTM) conducted a study on X-ray induced damage to memory devices, including audio and video tapes and floppy disks, and found that the devices usually have enough shielding to protect the media.

The study found that the magnetic field was actually strongest around the scanner's monitor. They taped a disk to the monitor for several hours without damage. A committee member suggested that it would take at least 1000 million passes through the machine before any damage would be evident.

Article Change History:

Applesoft: High-Res Memory Conflicts

Revised: 10/8/84
Security: Everyone

Applesoft: High-Res Memory Conflicts

=====

Use High-Res graphics with a long Applesoft program in the easiest way: relocate the program. You thus avoid all the problems of program text and variables storing in the High-Res buffers. The following programs initialize the Apple's memory and RUN your application program. After the program is loaded above the High-Res buffer, DOS and CHAIN continue to load programs there until you re-boot the system or execute a FP command.

For HGR

```
10 POKE 103,1
20 POKE 104,64
30 POKE 16384,0
40 PRINT CHR$(4); "RUN PROGRAM"
```

For HGR2 or both pages

```
10 POKE 103,1
20 POKE 104,96
30 POKE 24576,0
40 PRINT CHR$(4); "RUN PROGRAM"
```

FORTRAN: Pascal External Functions and Procedures

Revised: 9/21/84
Security: Everyone

FORTRAN: Pascal External Functions and Procedures

=====

When you use assembly language functions and procedures from FORTRAN, all parameters are passed to these functions and procedures as formal parameters. This means that when a function requires an integer, real number, boolean or character, it is the address of the variable being passed that resides on the stack, not the contents of the variable. Therefore, assembly language functions and procedures should load the address of the variable from the stack and use this address to retrieve the data in the variable.

Because of this small detail, it may not be possible to use some assembly language functions and procedures developed in Pascal from FORTRAN, since Pascal will pass data that requires two to four bytes of space on the stack. Data types requiring more space than two words (such as long integers, arrays, strings, and so on) are sent as formal parameters; therefore, the address in memory where the variable resides is passed on the stack, and the data is accessed through that address. When an external function or procedure in Pascal uses formal parameters, it can easily be used in FORTRAN; otherwise, it will have to be rewritten to handle the formal parameter stack format of FORTRAN.

If you wish to see a specific example of this difference, compare the assembly language listings of the paddle functions on page 120-121 of the Apple FORTRAN reference manual with the same listing on page 143-144 of the Apple Pascal Operating System Reference Manual.

NOTE: A FORTRAN host program calling a Pascal REAL subroutine with a VAR parameter may cause a "Stack Overflow".

Apple IIC Hardware: Port Pin assignments

=====

HAND CONTROL

Connector Pin Number	Signal Name	Description
1	GAMESW1	Switch input (paddle #1)
2	+5	+5 VDC (Do not exceed 100 MA)
3	GND	System Ground
4,9	-	Not used for hand controllers
5,8	PDL0 & PDL1	Hand control inputs. Each of these must be connected to a 1K pot connected to +5
6	N.C.	Not connected
7	GAMESW0	Switch input 0 (paddle #0)

MOUSE CONNECTOR

Connector Pin number	Signal Name	Description
1	MOUSEID	Mouse Identifier
2	+5V	+5VDC (Do not exceed 100 ma.)
3	GND	System Ground
4	X1	Mouse X-direction Indicator
5	X0	Mouse X-movement interrupt
6		Mouse button
7	MSW	Mouse button
8	Y1	Mouse Y-direction indicator
9	Y0	Mouse Y-movement interrupt

EXTERNAL POWER

Connector Pin Number	Signal Name	Description
-------------------------	----------------	-------------

1,7		Not Connected
2,3	Ground	Common electrical ground
4	Chassis	Chassis ground
5,6	+15V	+15VDC input to converter

AppleWorks: Justified indented paragraphs

Revised: 5/1/87
Security: Everyone

AppleWorks: Justified indented paragraphs

=====

In a Word Processor document, if you format a paragraph with left justification and tabs for the paragraph indentation and then rejustify the paragraph with full justification, the left and right margins stay the same, but the paragraph indentation may change or vary. AppleWorks appears to justify the spaces in the paragraph indentation.

The only workaround is a long process that should be performed only when the document is completed. If a paragraph shows the problem:

1. Separate the first line of that paragraph: move the cursor to the end of the line and press RETURN.
2. Format the line with spaces: place spaces in between words, bringing the line's margins in line with the paragraph's margins.

LaserWriter: How to Print all Fonts

Revised: 7/26/89
Security: Everyone

LaserWriter: How to Print all Fonts

=====

This article last reviewed: 5 July 1989

The LaserWriter or LaserWriter Plus prints documents in Courier from files generated with the Command-K option. To get other fonts to appear on the printed document, insert the font re-mapping code below between the LaserPrep text and PostScript document so that the order is:

1. LaserPrep (the Command-K file without the PostScript document)
2. Font re-mapping code addendum
3. PostScript document (the Command-F file)

Note: The LaserWriter driver assigns the name PostScript to this file. The file is placed into the folder where the application's printing resources reside. The assignment of the name and the placement of the file cannot be changed.

LaserPrep and the following addendum can be combined into one file.

```
% This code initializes all fonts on a LaserWriter Plus
% after the Laser Prep has been installed.  The number of fonts
% should be reduced for the original LaserWriter
```

```
% The query
md begin
%?fontList
lsf
%?end
end
```

```
% Sample of dynamically generated PostScript to initialize
% all fonts in above list.  The LaserPrep file must have
% already been down-loaded at this point (otherwise there would
% be no font list either).
% Make it stick
serverdict begin 0 exitserver
```

```

nf

A message--"The number of fonts/% should be reduced for the original LaserWriter"--appears about editing this LaserWriter Plus code for standard LaserWriters. Some users have such little success with this suggestion that they don't edit the code at all and just send the code to the LaserWriter regardless. This has the side effect of mapping the additional LaserWriter Plus fonts to Courier in the LaserWriter.

LOGO: Printing Graphics

Revised: 10/8/84
Security: Everyone

LOGO: Printing Graphics

=====

Printing out the graphics screen from LOGO is awkward. The following steps will get the job done. Brackets indicate the text you enter from the keyboard.

1. Draw the graphics on the LOGO screen.
2. Insert an intialized diskette in slot #6, drive #1. This should be a blank diskette that has been intialized with the [INIT HELLO] command from Apple DOS 3.3. It should not contain a HELLO program, though.
3. Enter [.PRINTER 6]; this causes the system to boot DOS.
4. If you have a Silentype printer, you can simply enter [CTRL-Q] to print.
5. Enter [BSAVE filename, A8192, L8192]; this will save high res page #1 as binary file filename.
6. Now you must use whatever is appropriate to your system to print out graphics from a binary file.
7. To do more LOGO graphics, you need to reboot LOGO and start again.

Apple II and II Plus: Shift-Key Modification

Revised: 9/30/88
Security: Everyone

Apple II and II Plus: Shift-Key Modification

=====

This article last reviewed: 26 September 1984

Probably all Apple II owners have heard of a mysterious "Shift-Key Mod". To many it has remained nothing more than a rumor, possibly because most modifications are thought to be costly additions. Not so the "Shift-Key Mod", the most simple and least expensive addition anyone could do for their Apple II. Of software recognizing this modification, there is a wide variety: Apple Writer, most other word processing software packages, and the firmware of most 80-column cards.

Software must recognize this alphabetic modification; the Apple alone does not do it automatically. After modification, the shift key allows you to enter uppercase characters as you do on a typewriter, without the need to precede them with a press of the Escape key or some other control character. You can still use the shift key to type the regular "shift" non-alphabetic characters, such as !, @, #, \$, %, ^, &, *, (,), and so on.

With the "Shift-Key Mod", you use the shift key to signal the software from an unused part of the Apple II Game port. The Port can address four separate hand controls and three hand-control pushbuttons of which only two of each are used by the standard game paddles and joysticks. This leaves unused two hand control inputs and a hand-control pushbutton input. The "Shift-Key Mod" exploits the address of this remaining pushbutton input. In practice, software supporting the modification first reads the character value at the address of the keyboard. Then, since joysticks use pushbuttons #0 and #1, the software reads the state of the address of pushbutton #2 (PB2). If the PB2 address is operated then the software simply makes the keyboard value represent uppercase.

To keep things in perspective, please note that this does not modify the Apple II to display lowercase nor enter lowercase characters into your programs when the II is in its native 40-column mode. To read the shift key's new address, the Apple II must have special software; without it, the II stays in 40-column mode. Most 80-column cards have firmware to read the address and display lowercase when in 80-column mode. When coding, you can easily enter lowercase

characters into your own program's output strings with 80-column cards supporting the modification. However, when the program runs in 40-column mode, lowercase characters will appear as "garbage" characters. Adding the reasonably-priced "Lowercase Character Generator" on the motherboard allows proper display of lowercase characters in 40-column mode. Apple Writer also supports lowercase character generators.

Now to make the modification. Connect two micro test clips together with 8 inches of 28 AWG wire and solder the connections. Use micro test clips to match the size of Radio Shack #270-370 clips. 28 AWG wire-wrap will do. Clip size is most important; wire size and brands are less important. Once the jumper cools, install it this way:

1. Clip one end to pin 1 of the IC located at motherboard location H14, a 74LS251.
2. Clip the other end to pin 24 of the molex connector that connects the keyboard electronics to the keyboard. Pin 25 of this connector is at the end away from the Apple's power supply. Pin 24 is to the left of pin 25.

LaserWriter Indicates A Paper Jam

Revised: 11/8/88
Security: Everyone

LaserWriter Indicates A Paper Jam

=====

This article last reviewed: 20 July 1988

PROBLEM DESCRIPTION: The LaserWriter I/O Board has been removed for troubleshooting purposes. The LaserWriter is powered on and the green light blinks. The LaserWriter then tries to generate a test print (as if the I/O board was still installed). After a short time the LaserWriter indicates that a paper jam exists when, in fact, there is no paper jam.

CURE: Remove and replace the scanner unit. Review the LaserWriter General Troubleshooting Procedures if the LaserWriter still indicates a paper jam.

COMMAND.COM: A General Description

Revised: 3/28/94
Security: Everyone

COMMAND.COM: A General Description

=====

This article last reviewed: 9/1/87

COMMAND.COM is a command interpreter for the ProDOS operating system. When used in place of BASIC.SYSTEM, it gives an Enhanced Apple IIe, Apple IIc, or Apple IIgs some of the power of the MS-DOS operating system.

- You can refer to disks by simple abbreviations such as A: or B:, rather than having to use ProDOS pathnames (you can still use pathnames if you prefer).
- You can run application software by simply typing the name of the program, without using RUN, BRUN, or "-" (you can still use "-" if you like). To change directories (setting the PREFIX under BASIC.SYSTEM), you can type PREFIX pathname, PRE pathname, CHDIR pathname, CD pathname, or just the pathname.
- COMMAND.COM adds the MS-DOS pathing concept to ProDOS. A path is the name of a directory that COMMAND.COM will search when you type the command to run a file. Normally, only the PREFIX directory is searched, but with COMMAND.COM, you can specify up to four additional directories. This allows you to run programs stored on other directories, such as a general utility directory.

COMMAND.COM lets you set up four environments: CP/M, MS-DOS, ProDOS, and UNIX. You can configure for the environment that you are most comfortable with.

COMMAND.COM includes 100 commands. Some are internal, such as the DELETE and COPY commands. Others are external files that are read in from disk before execution. COMMAND.COM, like MS-DOS allows a virtually unlimited number of commands stored as files on disk.

You can use wild cards with commands: for example, typing Copy * B: would copy all files on the current directory to disk B:. You don't need to know the name of the current disk or the disk to be copied to; COMMAND.COM handles that automatically.

COMMAND.COM supports both I/O re-direction and piping. I/O re-direction sends the output of a command to a device other than the one normally used. The TYPE command normally displays the contents of a text file on the screen. With I/O re-direction, the text could be sent to a printer or to another file.

Piping is used to make the output of one command the input to another. For example, the CATALOG command could 'pipe' the catalog of disk files to the SORT command, which would alphabetize the catalog before displaying it.

COMMAND.COM even lets you create commands that don't exist in your operating system -- for example, a command that MOVES a file from one location to another: not just copying it, but also deleting the original. The MOVE command would be created by combining the COPY, UNLOCK, and DELETE commands. Variables can also be used to assign short (one or two character) names that when typed will run an application program. An example might be typing AW to prefix to the AppleWorks directory and run the file APLWORKS.SYSTEM.

COMMAND.COM includes the following commands:

- Convert any type of file, including AppleWorks Word Processor files, into plain text files.
- Search all directories on a 3.5" disk or hard disk for any file.
- Display all files on a specific disk.
- Search and replace in a variety of formats.
- A picture display command that automatically recognizes all Apple II picture types, including GS pictures.

COMMAND.COM. also supports MS-DOS-style BATCH files. BATCH files are the perfect solution for handling many complex tasks easily and automatically. Running a system application does not effect the BATCH file. One example cited in the manual: a BATCH file can be used to run an application and track elapsed time. At the end of the month, the user can print the text file created by this BATCH file to generate billing information for work done for clients.

COMMAND.COM also includes a full-featured line-oriented text editor.

COMMAND.COM will be available in September 1987 from PinPoint Publishing.

Apple III Hardware: Motherboard Identification & Hints

Revised: 9/30/88
Security: Everyone

Apple III Hardware: Motherboard Identification & Hints

=====

This article last reviewed: 26 September 1984

There are two types of Apple III main logic and memory board combinations. They are typically referred to as either being "5-volt" or "12-volt".

Since there are two types of boards in the field, the first step in servicing an Apple III is to identify whether the system contains 5 or 12-volt boards. Apple III systems above serial number 100,000 are 5-volt systems. When the Apple III was first introduced, 64K random-access memory (RAM) chips were too expensive to incorporate into the Apple III design. Approximately a year later they became economically feasible and began to replace the mixture of 16K and 32K RAM chips used until then. An additional advantage was that a 256K system would actually draw less power than the original "mixed" 128K system.

The first and best way is to look at the part numbers of the ROM chips at locations C11 and C13. Here is what to look for:

12-volt

Location	Part #
C11	341-0044
C13	341-0042

5-volt

Location	Part #
C11	341-0061
C13	341-0062 (128K) or
C13	341-0063 (256K)

The 342-0063 part number works for either a 128K or 256K configuration. The second method of verifying which main logic you are working with is to look at R58, which is located just above location C13. On a 12-volt logic board a 27 ohm, 1/4 watt resistor will be present. On a 5-volt logic board R58 will be missing and a solder bridge will connect the small solder pads on the logic board under R58's mounting position on the board.

There are also two different types of Apple III memory boards. The 12-volt board has three rows of RAM on it. Two rows are filled with 16K RAM (Apple part # 334-0002) and one row with 32K RAM (part # 333-0002). A 256K 5-volt board has two rows of 64K RAM (part # 334-0003) mounted on it. A 128K 5-volt board has one row filled with RAM and one row empty. Five-volt boards are also marked "5-Volt Memory Board" on the top center of the card.

The two memory boards and the two logic boards are not totally interchangeable. Always remember that logic and memory boards of the same voltage must be used together. Main logic boards can be modified to work with either type of memory board, but memory boards cannot.

256K Upgrade Kits are available from Apple for both types of systems.

Additional Service Hints:

The keyboard encoder chip on the Apple III main logic board is a static-sensitive device. Before a replacement board is sent out from Apple, a piece of conductive foam is secured on the solder-side of the board covering the pins of the encoder. Before you install a replacement main logic board, be sure to remove this foam. If this is not done, either there will be no keyboard response or the Apple III will lock up and do nothing at all. Running the Apple III internal RAM test (F6E6G) with a ProFile interface card installed may cause the RAM test to fail. It is best to remove the ProFile card before running the internal RAM test.

New Apple III Diagnostic Diskette

There is a new Apple III Dealer Diagnostic diskette available from Apple Service. This single diskette offers both 12-volt and 5-volt memory board tests. The part number is 077-0013-A.

Apple Writer II under DOS 3.3: Printer codes from all Apples

Revised: 4/30/86
Security: Everyone

Apple Writer II under DOS 3.3: Printer codes from all Apples

=====

Many printers have special features that the computer signals by sending command codes. To send codes to a printer from Apple Writer II (DOS 3.3), you must insert the codes into the Apple Writer file you want printed. The manual of the printer may list the codes by several names: decimal, hexadecimal, teletype abbreviations (SOH, ETX, DC1, DC3, etc.), standard keys, and combinations of the above.

Using the chart "ASCII characters, values, and keystrokes", you have to translate from the name of the code in the printer manual into the name of the corresponding keystroke or keystrokes on the keyboards of the Apple II, Apple II Plus, Apple IIe, Enhanced Apple IIe, or Apple IIc.

Some keystrokes put so-called control characters into the Apple Writer file. These control characters are not part of the conventional English character set; while screen shows them, the printer intercepts and does not print them, instead recognizing them as signals to turn special functions on and off or to change printer settings.

NOTE: In the descriptions of the keystrokes, the characters greater than and less than, < and >, are used to contain one keystroke, which can mean that you must simultaneously hold down the control key, the shift key, or both as you press the other key.

With these considerations in mind, here is a list of codes and methods for inserting them in an Apple Writer II file.

Null (ASCII value 0):

II and II Plus: <CTRL-V><CTRL-SHIFT-P><CTRL-V>

All other Apples: <CTRL-SHIFT-2>

Control-A through Control-Z (ASCII decimal values 01 through 26):

Example: Control-Z (ASCII decimal value 26): <CTRL-V><CTRL-Z><CTRL-V>

Exception: Control-V (ASCII decimal value 22) can't be entered.
See "Missing Keys" below.

Escape (ASCII value 27):

Some keystroke sequences start with or include the ESCAPE character.

On Apple II without shift key modification:

If the printer manual shows the code as an escape followed by an upper case letter: <CTRL-V><ESC><ESC><ESC><CTRL-V>

If the printer manual shows the code as an escape followed by a non-alphabetic character or lowercase letter: <CTRL-V><ESC><ESC><CTRL-V>

On Apple II with shift key modification: <CTRL-V><ESC><CTRL-V>

Missing keys:

To produce uppercase a-z, press the ESC key first, otherwise Apple Writer II under DOS 3.3 enters the a-z keystroke as lowercase.

The Apple II and Apple II Plus don't have some keys: underline, backward slash, brackets, braces, vertical line, open single quote, tilde, or delete. You can't enter a Control-V in Apple Writer. To use these and other characters in Apple Writer, it is necessary to create an Apple Writer glossary file from a BASIC program.

For example, to insert the ASCII value 22 (Control-V) into an Apple Writer file, follow these steps:

1. Start up the DOS System Master.
2. Write and save the following program:

```
1  REM APPLE WRITER II GLOSSARY CREATION
10  D$=CHR$(4)
20  PRINT D$;"OPEN CVGLOSS"
30  PRINT D$;"WRITE CVGLOSS"
40  PRINT "V";CHR$(22)
41  REM USE LINE 40 AS A TEMPLATE FOR OTHER NEEDED CODES
42  REM CHOOSE A DIFFERENT GLOSSARY ENTRY FOR EACH CODE
43  REM PRINT "V";CHR$(22) V=ASCII 22 (CONTROL-V)
44  REM PRINT "W";CHR$(31) W=ASCII 31 (CONTROL-UNDERLINE)
45  REM PRINT "X";CHR$(128) X=ASCII 128 (CONTROL-@ WITH THE HIGH BIT SET)
46  REM PRINT "Y";CHR$( ) Y=AND SO ON
50  PRINT D$;"CLOSE CVGLOSS"
```

3. Run the program, thus creating a file called CVGLOSS.
4. Start up the Apple Writer diskette.
5. Press CTRL-Q and select the option to Load a Glossary File.

6. Remove the Apple Writer diskette and insert the diskette containing CVGLOSS.
7. Enter the name CVGLOSS at the "Enter File Name" prompt.
8. Return to Apple Writer and enter your text.
9. At any point where you need to enter a Control-V, type CTRL-G for the glossary function and enter V (uppercase).
10. This procedure should imbed the ASCII 22 in your text. Once CVGLOSS has been created, you can reuse it whenever necessary by following steps 5 through 9 each time you start up Apple Writer.

There's already a glossary file on the Apple Writer II diskette. This file is named SPECIAL and contains key definitions for the keys \, ^, ~, _, |, [,], {, }, ESC-D, and ESC-U.

Apple Writer III: Sending printer codes

Revised: 4/30/86
Security: Everyone

Apple Writer III: Sending printer codes

=====

Many printers have special features that the computer signals by sending command codes. To send codes to a printer from an Apple III with Apple Writer, you must insert the codes into the Apple Writer file you want printed. The manual of the printer may list the codes by several names: decimal, hexadecimal, teletype abbreviations (SOH, ETX, DC1, DC3, etc.), standard keys, and combinations of the above.

Using the chart "ASCII characters, values, and keystrokes", you have to translate from the name of the code in the printer manual into the name of the corresponding keystroke or keystrokes on the keyboard of the Apple III.

Some keystrokes put so-called control characters into the Apple Writer file. These control characters are not part of the conventional English character set; while screen shows them, the printer intercepts and does not print them, instead recognizing them as signals to turn special functions on and off or to change printer settings.

With these considerations in mind, here is a list of codes and methods for inserting them in an Apple Writer file on an Apple III.

NOTE: In the descriptions of the keystrokes, the characters greater than and less than, < and >, are used to contain one keystroke, which can mean that:

1. You must simultaneously hold down the control key, the shift key, or both as you press the other key, or
2. You must press a special key, such as ESC or RETURN.

Null (ASCII value 0):

Because Apple Writer III uses the null character to mark the end of a file, Apple Writer does not allow a null to be inserted into the file. The inserted null would effectively delete any text after it.

Apple Writer does send a null in the place of a Control-Underline character:

<CTRL-V><CTRL-UNDERLINE><CTRL-V>

Control-A through Control-Z (ASCII decimal values 01 through 26):

Example: Control-Z (ASCII decimal value 26): <CTRL-V><CTRL-Z><CTRL-V>

Exception: Control-V (ASCII decimal value 22) can't be entered.
See "Missing Characters" below.

Escape (ASCII value 27): <CTRL-V><ESC><CTRL-V>

Other Control characters: These can be entered in the manner of Control-A through Control-Z.

Missing Characters:

You can't directly enter a Control-V in Apple Writer. To use this character in Apple Writer, it is necessary to use an Apple Writer glossary file. You will find such a file on the Apple Writer III master diskette.

Apple Writer doesn't send a Control-Underline as such.

Business BASIC can be used to send a Control-Underline to your printer.

1. Create your Apple Writer document as usual, but substitute a unique character in each place that you want a Control-Underline character.
2. Type <CTRL-P> to display the Print/Programs Command menu.
3. Type PD.Volume/Filename, Apple Writer's setup for printing to disk on an Apple III.
4. Type NP to begin printing.
6. After the printing to disk is finished, exit Apple Writer and start up Business BASIC.
7. Run the following program:

```
100 HOME
110 PRINT TAB(10);"APPLE WRITER TO PRINTER"
120 VTAB=5
130 INPUT"PATHNAME OF APPLE WRITER FILE PRINTED TO DISK: ";F$
140 IF F$="" THEN 900
145 VTAB=12
146 INPUT"CHARACTER TO REPLACE: ";X$
147 IF X$="" THEN 145
150 VTAB=10
160 INPUT"Driver Name: (e.g. .PRINTER) ";S$
170 IF S$="" THEN 900
200 ON ERR GOTO 800
210 UNLOCK F$
220 OFF ERR
```

```
230   VTAB=12:PRINT SPC(75)
240   PRINT
265   OPEN#1 AS OUTPUT,S$
270   OPEN#2 AS INPUT,F$
280   ON ERR GOTO 400
290   INPUT#2;LINE$
300   A$=""
302   L=LEN(LINE$)
304   FOR Q=1 TO L
306     C$=MID$(LINE$,Q,1)
315     IF C$=CHR$(12) THEN 310
320     IF C$=CHR$(13) THEN 350
330     IF C$=X$ THEN C$=CHR$(31)
340     A$=A$+C$
345     NEXT Q
350   OUTPUT#1
355   PRINT A$
390   GOTO 290
400   OFF ERR
410   CLOSE
430   VTAB=15
440   PRINT TAB(5);"FILE ";F$;" HAS BEEN PRINTED."

Apple II and ILe: Controlling the Reset key

Revised: 4/30/86
Security: Everyone

Apple II and ILe: Controlling the Reset key

=====

On an Apple II or Apple ILe computer, the programmer can control how a BASIC program will react when reset or control-reset is pressed. DOS uses three special locations which it consults whenever reset or control-reset is pressed. Based on the values contained in these memory locations, DOS may halt a program, rerun the program, reboot a disk, or take another action you specify.

Changing these values changes the results of typing reset or control-reset from the keyboard.

To discourage users from breaking into a Basic program, some programmers change the reset vector to restart a running program whenever reset is pressed. Put the following line at the beginning of your program to get this effect:

```
10 POKE 1010, 102 : POKE 1011, 213 : CALL -1169
```

A value is not POKed into location 1012 because the CALL statement sets location 1012 to the correct value for the current situation. When you wish to return reset to its normal action, include this Basic line:

```
20 POKE 1010, 191 : POKE 1011, 157 : CALL -1169
```

You can also force a disk boot to occur whenever reset is pressed. Simply change the value of one of the three reset vector locations. An example is:

```
30 POKE 1012,1
```

You may instruct the reset vector to call one of your own machine language routines by placing the address of this routine in locations 1010 and 1011, and CALLing the ROM routine at location -1169 to set location 1012. Your routine may process information, display a warning message, or do anything else you wish.

Apple Color Plotter: Product Description (Discontinued)

Revised: 10/7/93
Security: Everyone

Apple Color Plotter: Product Description (Discontinued)

=====

This article last reviewed: 8 November 1988

The Apple Color Plotter will work with the Apple II family (through a Super Serial Card, not supplied with plotter) and the Apple III (through the RS-232 port). It uses a standard RS-232 interface so anyone who can send out ASCII and meet the handshake specifications will be able to use this plotter. The plotter offers a 255 byte buffer and is provided with switches to allow it to be matched to many computers. Options available with the switches are:

Baud Rate:	75 to 9600
Stop Bit:	1 Bit
	1 1/2 Bit
	2 Bit
Parity:	Odd
	Even
	None
Data Length:	7 Bit
	8 Bit

The Apple Color Plotter accepts several different sizes and thicknesses of paper and can draw on transparency materials as well as paper. There are 8 different colors of pins and two thicknesses (.3mm or .7mm). The colors come in both water base and oil base (quick drying) inks.

A company called Sun Remarketing specializes in obsolete Apple products. For more information, search on "Sun Remarketing".

Floppy Disk Drives: Apple III Plus External Drive Adapter

Revised: 8/10/87
Security: Everyone

Floppy Disk Drives: Apple III Plus External Drive Adapter

=====

The Apple III Plus has a DB25 connector for the external disk drive I/O port. The standard Disk III has a 26-DIP flat connector on the cable. To use the standard Disk III with an Apple III+, you must acquire a Disk III Cable Adapter. The service part number for this cable adapter is 655-6101.

Future Disk III drive cables will have a DB25 connector and will need no adapter.

CAUTION: Before connecting a Disk III to an Apple III+, be sure that pin 13 has been removed from the adapter. The pin can either be clipped off or pulled out. Later versions of the adapters may have this pin removed for you.

Lisa: Copy-protected Tools

Revised: 11/8/88
Security: Everyone

Lisa: Copy-protected Tools

=====

This article last reviewed: 8 November 1988

Master tool diskettes are copy protected. The method still seems to confuse people to a fair degree. This article should cover any question you may have about Lisa's protection scheme.

The first time you duplicate a tool master diskette, that diskette AND its copy are tied to the specific Lisa you're using to perform the duplication: both diskettes are imprinted with that Lisa's serial number. This imprinting occurs almost immediately, so even if you abort the copy, both diskettes will probably already be tied to that Lisa. You may make as many copies of that master diskette as you like, but those copies will run only on the Lisa that made the first copy. Users can make as many back-ups as they feel necessary, while we are able to protect ourselves from unauthorized dissemination of Lisa software.

The original tool master diskette may be used on any Lisa, but you will not be able to copy the tool onto the ProFile.

The serial number that the diskettes are imprinted with is the one burned into the PROM located at position C6 on the CPU board. If the CPU board is replaced for any reason, it's very important that this PROM is transferred to the new board; otherwise, that Lisa's user will no longer be able to use applications stored on his or her hard disk. If that particular PROM itself is bad, request a new one from your Technical Support Center.

Files that are protected by this scheme will have the file attribute P when listed by the Workshop. This attribute cannot be changed.

Protected Lisa software distributed by Apple includes:

- All Lisa tools, except for LisaWrite and LisaProject 3.1. (Stationary pads, Office System diskettes and LisaGuide are not protected.)
- Pascal 1.0 and 2.0: PASCAL.OBJ, CODE.OBJ and EDITOR.OBJ are protected.

..TIL00151-Lisa-Copy-protected_Tools_(TA31513).pdf

(Pascal 3.0 is not protected.)

- COBOL 1.0, 2.0, and 3.0: overlay files are protected, as well as EDITOR.OBJ.
- BASIC-PLUS 1.0, 2.0, and 3.0: BASIC.OBJ and EDITOR.OBJ are protected.

LisaProject: Applications of LisaProject

Revised: 10/8/84
Security: Everyone

LisaProject: Applications of LisaProject

=====

While the Lisa applications library offers many attractive features, LisaProject draws the attention of many executive decision makers. Apple presents LisaProject as a powerful instrument to efficiently and effectively accomplish resource scheduling. But as one explores the subject beyond this point, many questions arise. What is PERT, and how does LisaProject use PERT to achieve its schedule? What is a critical path and what are its implications? How does one apply LisaProject in the real world? Although the complete answers to these questions go beyond the scope of this publication, we will briefly discuss some of the issues and provide further research avenues for the reader.

What is PERT? PERT (Program Evaluation and Review Technique) is a scheduling algorithm, developed and utilized extensively by the Air Force during the Second World War. It identifies the tasks, resources, and their associated time-frames needed to complete an objective. Simply put, PERT is a network model which determines the significance and timing of the tasks involved in completing a project. As opposed to the majority of linear programming models that seek to maximize/minimize an objective function, PERT's algorithm uses Lisa's date arithmetic to arrive at the estimated sums of elapsed time to complete a "leg" of the project. The individual times associated with each "leg" are then compared to determine the longest route. This longest "leg", then, is the "critical path". Each task along the "critical path" is identified as a mandatory activity which is essential to timely completion of the project, and therefore, is defined by the system as having no spare ("slack") time. Again, as opposed to linear programming tools, PERT neatly avoids "superoptimization" (scheduling of two or more resources during the same time period), while arriving at an optimal solution to the problem.

Management scheduling staffs can bring the project generation phase to a rapid finish. During the progress of the project, the "what if" capabilities offer myriad uses. Specifically, the "critical path" identification feature not only indicates the relevant priorities of tasks, but its corollary argument tells the manager which tasks he can relatively ignore. If task A, to give an example, is not on the "critical path", then one should not expend labor, money or other scarce resources to try to expedite it. Devoting further resources to task A just will not abbreviate the length of the entire project.

Also, the planner may take the completed project and use it to clearly develop budgets by tagging dollar values to resource and task "classes" and using LisaCalc to crunch the numbers.

For readers who desire further information on these topics, see:

Monitor II: Specifications (Discontinued)

=====

I. Technical Specifications

A. Electrical

1. CRT type: 12 inch (30.5 cm) diagonal
 - nonglare
 - high-contrast screen
 - 90 degree diagonal reflection
2. Phosphor: P31 (Green)
 - Decay time of 70usec from 100% to 10%
3. Scanning: EIA standard
 - 525 lines
 - 30 frames
 - 60 fields/second
 - Overscan
4. Data input signal: 0.5 to 2.0 volt p-p composite
 - Negative synchronous into 75 ohms (RS-170 compatible)
5. Drive or scan rates:
 - a. Horizontal: 15.699 KHz
 - b. Vertical: 60 Hz
6. Video bandwidth: 18 MHz
7. Horizontal Resolution:
 - a. At center: 900 TV lines
 - b. At corners: 800 TV lines
8. Horizontal Linearity: Less than 10%
9. Power requirements: 101.2 to 120.75 VAC (115VAC +5%, -12%)
 - 50/60 HZ, frequency independent

10. Power consumption: 30 W under normal viewing conditions

11. Display capability: 80 characters/row, 24 rows

12. Input connector: RCA type, 75 ohms terminated

Monitor III: Repair Tips

Revised: 5/25/89
Security: Everyone

Monitor III: Repair Tips

=====

This article last reviewed: 7 November 1988

A typical problem reported on the Monitor III is "no video". In these cases, adjusting either the contrast or brightness controls on the monitor solves the problem. With an Apple II or II+, the problem lies in the computer's video adjustment potentiometer, K14 on the main logic board. It is often adjusted too low.

Before you send a Monitor III in for exchange, make sure that the monitor has the problem and not:

1. the video cable or
2. too low of an adjustment of the video signal by the video adjustment potentiometer, K14 on the main logic board.

Apple IIGS: Changing settings of the serial ports

=====

This article last reviewed: 9/14/87

Changing the software settings of the serial ports for either data format or parity disables buffering, often used during access of bulletin boards. If a program changes the settings for Data Format (bits per character) or Parity, the program should re-enable buffering.

To change through software the baud rate from 1200 to 300 on the serial port, use nnB, the command in the Technical Introduction to the Apple IIGS, Page 35. The baud rate change will not show up in the control panel. The control panel displays the settings that are saved in firmware.

If you are using the Printer port, the control character is a Control-I. If you are using the modem port, the control character is a Control-A. Use the following numbers for the baud rates.

n Baud Rate

0 Default (as set in Control Panel)	
1	50
2	75
3	110
4	134.5
5	150
6	300
7	600
8	1200
9	1800
10	2400
11	3600
12	4800
13	7200
14	9600
15	19,200

For example, the following program changes the baud rate from 1200 to 300 under software control.

```
10 D$=CHR$(4):I$=CHR$(1)
20 PRINT D$;"PR#2"
30 PRINT I$;"8B": REM ENSURE 1200 BAUD
40 PRINT"This is a test of 1200 Baud"
50 PRINT I$;"6B": REM SET UP 300 BAUD
60 PRINT" This is a test of 300 Baud"
70 PRINT D$;"PR#0"
80 END
```

To verify that the baud rate is changing, run this program after connecting another system to the modem port. Depending on the baud rate for that receiving system, one of the sentences sent will not be legible.

Pascal III: Description of the Pascal Technical Reference Manual

Revised: 10/8/84
Security: Everyone

Pascal III: Description of the Pascal Technical Reference Manual

=====

You can get an overview of the internal workings of Apple III Pascal from the Apple III Pascal Technical Reference Manual. It covers the format of code files and, including data structures and p-code instruction, describes the P-Machine that actually runs Pascal programs. To aid efficient Pascal programming, the manual also discusses writing helpful assembly-language routines, e.g., a routine to allow a Pascal program to access more than 64K of data.

The Supplement describes routines that allow access to all SOS calls directly from Pascal. An accompanying diskette contains this set of SOSIO routines in both source and object. With the source, you can learn about the routines or modify them for your applications; with the object, you can use the routines as they are.

Apple III: Printing from BASIC and Pascal

Revised: 8/15/86
Security: Everyone

Apple III: Printing from BASIC and Pascal

=====

Many times it is desirable to have a program send selective, processed output to the printer. Both Business BASIC and Pascal have the commands to handle this chore; however, none of the language reference manuals provide an example for printing to a printer where the syntax of the commands is illustrated.

When directing output to the printer, it is important to remember that Apple III's Sophisticated Operating System (SOS) treats everything as a file. In this sense, any output, whether to a printer or diskette, is handled identically:

1. Programs pass data to SOS as files.
2. In SOS, the SOS File Manager passes the file to the appropriate device driver.
3. The device driver passes the output to the selected device.

The device driver does the job of transmitting the output in the fashion that the device requires it. Input data follows the same path, only in reverse. Understand these passes of files through the operating system. SOS and the device drivers can handle the details; you must handle the concept.

Here is an example of printing to both screen and printer from a Business BASIC program. Without the delay subroutine in line 100, everything would appear to happen at once, so we have it in the program only to improve the sense of sequence during execution.

```
10 OPEN#1, ".printer": REM Declare the printer as a file.
20 PRINT "This is a test.": GOSUB 100
30 REM Output goes to the screen.
40 PRINT#1 "This is a test.": GOSUB 100
50 REM Output goes to File #1, the printer.
60 PRINT "This goes to the screen.": GOSUB 100
70 REM Without file specification
80 PRINT#1 "This goes to the printer."
90 CLOSE#1: END: REM Close the file ".printer" and end.
```

```
100  FOR delay = 1 to 2000: NEXT delay: RETURN
```

The program could also use ".silentype" for the printer device driver.

The separate statements OUTPUT#x and PRINT can be used in succession to direct output to device x.

For instance, to simply list a program to the printer, the following commands can be entered at the keyboard in direct mode.

```
OPEN#1, .printer  (Notice, no quotes are needed in direct mode.
OUTPUT#1          (Routes all subsequent output to File #1)
LIST
CLOSE             (CLOSE in place of CLOSE#1 will close all
                  files instead of ".printer" -- with no other
                  files open it's just easier to type.)
```

There are other useful commands using this concept which are variations of other familiar BASIC commands besides PRINT. They are GET#1, INPUT#1, READ#1, and WRITE#1. The Apple III can have as many as ten files open for input and output at one time, so, where "#1" is used in the examples, it could be "#7", and so on.

The following is an example of how to print both to the screen and printer from a Pascal program. Again, the delay procedure is not necessary.

```
program PRINT_OUTPUT;
  var OutFile: text;

  procedure DELAY;
    var Count: integer;
  begin
    for Count := 1 to 2000 do
      end; {Delay}

begin
  rewrite (OutFile, '.printer'); {Declare the printer}
                                {as a file.}
  writeln ('This is a test.');
```

{Output goes to the screen.}

```
  DELAY;
  writeln (OutFile, 'This is a test.');
```

{Output goes to}

{the printer.}

```
  DELAY;
  writeln ('This goes to the screen.');
```

{Output goes to}

{the printer.}

```
  close (Outfile) {Close the file ".printer" and end.}
end. {Print_Output}
```

The Apple III can have as many as ten files open for input and output at one time; "OutFile" is only one. Additional files can be declared with additional REWRITE statements.

..TIL00160-Apple_III-Printing_from_BASIC_and_Pascal_(TA32242).pdf

To simply list a program to the printer, go to the Filer and transfer the text file to .PRINTER (for the Apple III) or to PRINTER: (for the Apple II and Apple IIe).

Since Pascal treats output as a file, both of these examples work with both Apple II and Apple III Pascal.

ImageWriter: Superscripting, Subscripting, and Underlining

Revised: 7/30/90
Security: Everyone

ImageWriter: Superscripting, Subscripting, and Underlining

=====

This article last reviewed: 21 September 1984

A set of superscripted and subscripted characters resides as an alternate font in a file on the "Imagewriter Tool Kit" diskette, which is included in the accessory kit. An option of the Tool Kit menu downloads the super/sub-scripted character font. After the download, you can invoke the alternate font with "ESC '"; "ESC \$" restores the standard (switch selected) character font. In this font, symbols generate superscripted numerals, and numbers generate subscripted numerals.

Applewriter accomplishes superscripts and subscripts on Imagewriters with serial numbers 250001 or greater. If the serial number is less, the Imagewriter must be upgraded.

NOTES:

1. The word Escape in the following instructions refers to hitting the Escape key.
2. The blanks should not be keyed in; they are there to make the strings readable.
3. The command strings take up room in the line and are counted as characters when printing takes place, even though the commands themselves are not printed.

In an Applewriter file:

1. Type in [V] Escape l [V]. This enables the optional line feed function.
2. To do a superscript:
 - a. Type: [V] Escape T 12 Escape r [J] [V]
 - b. Enter the superscript text.
 - c. Type: [V] Escape f [J] Escape T 24 [V]

3. To do a subscript:

- a. Type: [V] Escape T 12 [J] [V]
- b. Enter the subscript text.
- c. Type: [V] Escape r [J] Escape f Escape T 24 [V]

Underlining requires no printer modification. Just send "ESC X" to start underlining and "ESC Y" to stop it. Apple Writer users will probably not use this method to underline; however, if they do, note that X and Y are uppercase.

Apple IIGS: Reading and setting the Clock (1 of 2)

Revised: 5/1/87
Security: Everyone

Apple IIGS: Reading and setting the Clock (1 of 2)

=====

Reading and writing the clock register and the clock control register is not necessarily the easiest or most proper way of accessing the time. However, there are tool calls that can perform this function for you. Included in the Miscellaneous Toolset are 3 routines, two to read and write the time in hex format and one to read the time in ASCII format. The program below shows how to use all three.

Here is a summary of the three calls:

`_ReadASCIITime` reads the IIGS clock and fills a specified buffer with a string that shows the time and date according to the format described in the control panel. Before the call, push the long address (4 bytes) of a buffer on the stack. Place the string in this buffer, a location in memory; the buffer can vary in size (because of the possible string formats), but it should be about 22 bytes.

`_ReadTimeHex` reads the IIGS clock and leaves the time and date on the stack. Before the call, push 4 words (8 bytes) of space for the result. After the call, the stack will contain the following information (specified in bytes):

previous contents	
weekday	day of the week (0..6, with 0=Sunday, etc.)
null	unused
month	0..11, with Jan=0
day	0..30
year	current year minus 1900
hour	0..23
minute	0..59
second	0..59
	<--- Stack Pointer

`_WriteTimeHex` sets the time according to information on the stack. The information pushed onto the stack should be bytes: month, day, year, hour, minute, and second - pushed on in that order (after the data is pushed on the stack, the stack will look similar that returned by `_ReadTimeHex`). After the call is completed, the stack will have those parameters removed.

Apple Logo II: Specifications (Discontinued)

Revised: 9/10/93
Security: Everyone

Apple Logo II: Specifications (Discontinued)

=====

Order #: D2D0100

--Technical Specifications

Operating System: DOS; for use with Logo II, Logo DOS files can be converted to ProDOS files with the CONVERT program on the ProDOS User's Disk or the II System Utilities Disk

--Package

1. Disk: Apple Logo Master
2. Disk: Apple Logo Backup
3. Manual: An Introduction to Programming through Turtle Graphics
4. Manual: Apple Logo Reference

--System Configuration

1. Apple II Plus, IIe or IIc personal computer
2. Apple II disk drive with controller
3. Apple Language Card
4. Video Display: television or monitor
5. Recommended: ImageWriter or other compatible printer; color display; AppleMouse

Apple IIGS: Reading and setting the Clock (2 of 2)

Revised: 5/1/87
Security: Everyone

Apple IIGS: Reading and setting the Clock (2 of 2)

=====

This is a simple program that will display the time and allow the user to enter 3 keys:

1. Escape - Exit the program
2. Up arrow - Increment seconds
3. Down arrow - Decrement seconds

There is a feature limitation in that the program doesn't update the minutes when the seconds become less than zero or greater than 60. It turns out that this is no problem when incrementing the time, but leads to interesting side effects when decrementing it.

The 'macros' short and long should be replaced by the following instructions:

short:	long:
-----	-----
sec	clc
xce	xce
sep #30	rep #30

They simply put the computer in either 8- (short) or 16- (long) bit mode, whichever is necessary at the time.

Start

```
        short                ; put the computer in 8-bit mode
        lda c010             ; clear the keyboard
loop     jsr ShowTime         ; show the time and date
        jsr ReadKey          ; see if a char was typed, and act on it
        bcc loop             ; carry set if ESCAPE is hit
        rts
```

ShowTime

```
        long
        pea 0000              ; point output buffer to screen
        pea 0400
        ldx #0f03             ; _ReadAsciiTime (put ASCII time onto screen)
```

```
        jsr $e10000
        short
        rts

ReadKey
        lda c000                ; was a key hit?
        bmi KeyHit              ; yes, do something about it.
        clc                     ; no - return to main loop
        rts

KeyHit
        lda c000                ; get the key (high bit set)
        sta c010                ; clear keyboard strobe
        cmp #9b                 ; Escape?
        bne NotESC
        sec                     ; Escape was hit - set Quit flag
        rts

NotESC
        cmp #9a                 ; down arrow?
        beq Arrow
        cmp #9b                 ; up arrow?
        beq Arrow
        clc                     ; neither, return with no error
        rts

Arrow
        sta temp                ; remember which arrow was chosen
        long
        pha                     ; push room on stack for time in hex format
        pha
        pha
        pha
        ldx #0d03               ; _ReadTimeHex (leave everything on the stack
        jsr e10000              ; for _WriteTimeHex later)
        short
        ldx 01,s                ; get the seconds
        ldx temp                ; recall which arrow was hit
        cpx #9a
        beq dnArrow
        inc a                   ; increment time on up arrow
        bra cont

dnArrow
        dec a                   ; decrement time on down arrow

cont
        sta 01,s                ; put it back on the stack
        long
        ldx #0e03               ; _WriteTimeHex
        jsr e10000
        pla                     ; get rid of extra stuff from _GetTimeHex
        short
        jsr ShowTime            ; update the screen
        bra ReadKey             ; see if another key was hit

Temp    ds 1                   ; temporary storage
```

The calls and usage shown in the program are described in "The Apple IIGS
Toolbox Reference Manual: Parts 1 and 2" available from Addison-Wesley.

Lisa Pascal: Mounting and Reading Disk Directories

Revised: 7/30/87
Security: Everyone

Lisa Pascal: Mounting and Reading Disk Directories

=====

From a Pascal program, you can indeed read the directory information of a diskette. Once you have detected the insertion of a diskette into the drive by using KeybdEvent (cf. Pascal Language Reference Manual, Appendix C), perform the following commands in order to mount and read the directory:

```
mount (error, volname, passwd, device)
reset_Catalog (error, pathname)
```

Then read the file names until done (error 848) by performing the command:

```
get_next_entry (error, prefix, filename)
```

Chapter 2 of the Operating System Reference Manual documents these and other file system calls that allow you to get information about the file: name, date, size, etc.

ImageWriter LQ: Things To Be Aware Of

Revised: 1/30/92
Security: Everyone

ImageWriter LQ: Things To Be Aware Of

=====

This article last reviewed: 1 December 1987

There are several things one should be aware of when using an ImageWriter LQ.

- Paper Handling Concerns -

Refer Chapter 2 pages 16 and 17 of the ImageWriter LQ Owner's Guide for proper paper loading techniques. For complete information on paper handling refer to Chapter 7: Working With Paper.

Paper Loading - The paper must be loaded correctly or there may be paper jams.

Don't use paper with staples or paper clips attached.

Do not move the paper bail manually. This will interrupt a form feed and proper paper placement. The ImageWriter LQ is designed to manipulate the paper bail automatically. Refer to Chapter 7 of the ImageWriter LQ Owners Manual for more information.

Do not back paper or labels out of the printer.

The push/pull tractors can cause many problems if not used correctly. Be sure to refer to the push/pull tractor sections in the manual for correct paper loading techniques.

Paper thickness - Never use a form, label, or envelope that is thicker than 4 sheets of 16 pound bond paper. Too much paper may cause lines to register incorrectly or may jam the printer.

Do not try to print closer than 1/4 inch to the edges of the paper. It is possible to damage the print head or the printer.

- Cut Sheet Feeder -

Refer to Appendix A on installing the Cut Sheet Feeder for complete instructions.

Do not use 4 part carbonless forms thicker than .55 mm. Thicker forms may cause the print head to lose position and lead to possible damage to the printer.

The Cut Sheet Feeder works best with 20-pound paper and up to 100 sheets loaded. For optimal results, use uncoated paper like Antique, Laid, English, Linen, Cockle, Woven, Policy, Vellum, or Smooth.

The Cut Sheet Feeder and two expansion bins won't work unless the configuration plug is removed from the third bin. See page 163 of the ImageWriter LQ Owners Manual for complete information.

- Cut Sheet Feeder and Envelopes -

See pages 173 to 176 of the ImageWriter LQ Owners Manual for complete information on loading and using envelopes.

When loading envelopes the edge of the envelope must align with the cut sheet icon on bin 1 behind the forward collator and with the vertical red mark on the paper bail so that printing will begin no further to the left edge than the black mark on the paper bail, at least 1/4 inch in from the edge. Proper alignment prevents print head damage.

It is very important that no attempt is made to print on the top line in the envelope's upper left corner or on the first 1/4 inch in from the envelope's left edge. Serious print head daamage can result, and the paper feed mechanism may jam. Printing one line down from the top, and in line with the black mark on the paper bail is fine and causes no problems.

- Miscellaneous Concerns -

When connecting an ImageWriter LQ to a Macintosh be sure to read Chapter 3 on connecting the printer to a Macintosh. Pay special attention to the adding of the fonts to you disks.

If using pin feed paper make sure the paper is properly aligned in the tractors.

Macintosh 128K and 512K: Modem cable pinouts

Revised: 7/16/92
Security: Everyone

Macintosh 128K and 512K: Modem cable pinouts

Article Created: 21 September 1984
Article Last Reviewed: 30 June 1992
Article Last Updated:

Below is the wiring diagram of the connection between a Macintosh 128K/512K and an Apple Modem.

Macintosh Modem Cable 590-0197

Macintosh			Apple Modem		
Connector			Connector		
(DB-9)			(DB-9)		
Comments	Signal Name	Pin	Pin	Signal Name	Comments
Chassis/frame Ground	GND	*1	<---> 8	GND	Chassis/Frame Ground
Signal Ground	SGND	*3	<---> 3	SGND	Signal Ground
		*8	<---> 1		
NOTE: There are many variations on connecting pins 1, 3 and 8, but the basic intent is to bring all three of those pins to ground on the Macintosh side. Connect Signal Ground to Chassis Ground if you want a slightly better noise margin.					
Output; Transmit Data	TXD-	5	<---> 9	RCD	Input; Receive Data
+12-Volt Line		6	<---> 6	DTR	Input; Data Terminal Ready
Input; Handshake	HSK	7	<---> 7	DCD	Output; Data Carrier Detect
Input; Receive Data	RCD-	9	<---> 5	TXD	Output; Transmit Data

If you wish to connect the DB-9 Modem port connector on the Macintosh 128K/512K to a DB-25 connector on a non-Apple modem, a Macintosh Imagewriter cable connected to the Modem Eliminator cable works in most cases. Here are the pinouts for that configuration:

	DB-9		DB-25	
	Macintosh		Modem	
	DTE		DCE	
Chassis Ground	1	<--->	1	Chassis Ground
Signal Ground	3	<--->	7	Signal Ground
Output; Transmit Data	5	<--->	2	Input; Transmit Data
Input; Handshake	7	<--->	6	Output; Data Set Ready
Input; Receive Data	9	<--->	3	Output; Receive Data

If this configuration doesn't work, try these additional cable connections:

+12-Volt Line	6	<--->	20	Input; Data Terminal Ready
Output; Handshake	2	<--->	20	Input; Data Terminal Ready
Output; Handshake	2	<--->	4	Input; Request to Send
Input; Handshake	7	<--->	8	Output; Data Carrier Detect

You will have to make a cable to try these additional connections one by one or in combination. If you have the pinouts of your modem, make a cable that matches up the Apple Modem signals with the appropriate pins on the other modem's connector, e.g., connect pin 1 on the DB-9 connector to pin for Chassis/Frame Ground on the modem's DB-25 connector, and so on.

Refer to the RS-232 standard for the connection signals and corresponding pin numbers.

Macintosh Software: Microsoft BASIC support of the Toolbox

=====

Microsoft BASIC, prior to release 2.0, supported a mouse in a very limited manner, with limited use of windows and menu bars. Because it uses MBASIC commands, Microsoft BASIC (pre-2.0) does not support QuickDraw. If you wish access to QuickDraw and Toolbox routines such as windows and menu bars, upgrade your Microsoft BASIC to the latest release.

SoftCard III (CP/M): Microsoft BASIC Reference Manual Errata

=====

In Appendix D: Disk Errors, page 174 reads:

67	Too many files	An attempt is made to create a new file (using SAVE or OPEN) when all 255 directory entries are full.
----	----------------	---

It should read:

67	Too many files	An attempt is made to create a new file (using SAVE or OPEN) when all directory entries are full. The CP/M limitation for a diskette is 48 files; the hard disk limitation is 512.
----	----------------	--

However, if you use files larger than 16K you will have two directory entries for the file. If the file happens to be over 32K there will be three entries. This 16K is a file boundary for CP/M, irregardless of block size.

Applesoft: Stopping the Apple IIe cursor from blinking

Revised: 10/8/84
Security: Everyone

Applesoft: Stopping the Apple IIe cursor from blinking

=====

You prefer a solid non-flashing cursor over the flashing "checkerboard" that the Apple IIe normally provides? If you have Apple's 80-column Text Card just type PR#3, then ESC-4. The system will have the eighty column cursor (a solid non-flashing blank) and will be in 40-column mode.

If you do not have a Text Card, fear not; just type

```
POKE 49162,0: PRINT CHR$(4);"PR#3"
```

and you can get the same effect.

You can use this next sample routine as the startup program on a diskette or the startup routine in an Applesoft program. Line 14 determines whether it is on an Apple IIe or an Apple II. If, by the time Line 16 executes, no Apple Text Card is detected in the system, then Line 18 enables the 80-column firmware.

[NOTE: The firmware is enabled by the monitor during Cold Boot (i.e., power-on startup or OPEN-APPLE-CTRL-RESET) if there is a Text Card installed].

Line 18 activates the firmware now that it is enabled. The 80-column firmware maintains a mode status byte in RAM at location 1275 (\$04FB). Bit 7 of this byte determines whether Lowercase Restrict mode is active or not. Line 28 guarantees that this bit is set to enable the mode. Lowercase Restrict mode is normally only available in direct mode typing Escape-R and cannot be done otherwise in a program.

```
10 TEXT : SPEED= 255
12 D$ = CHR$(4): REM CTRL-D
14 IF NOT ( PEEK (64435) = 6) GOTO 30: REM NOT APPLE IIE
16 IF NOT ( PEEK (49162) < 128) GOTO 20:
    REM TEXT CARD INSTALLED
18 POKE 49162,0: REM ENABLE 80-COLUMN FIRMWARE
20 PRINT D$;"PR#3": PRINT : REM ACTIVATE FIRMWARE
22 PRINT CHR$(17): REM SWITCH TO 40-COLUMN MODE
```

```
24  MB = 1275: REM 80-COLUMN FIRMWARE MODE BYTE ($04FB)
26  MS = PEEK (MB): REM READ CURRENT MODE STATUS
28  IF (MS < 128) THEN POKE MB,MS + 128:
    REM SET BIT-7 TO ENABLE LOWER CASE RESTRICT MODE
30  NORMAL : HOME
```

Macintosh 128K and 512K: Data transfer and processing rates

=====

Article Created: 10 June 1985
Article Last Reviewed: 19 June 1992
Article Last Updated:

TOPIC -----

The following article provides information on data transfer and processing rates for the Macintosh 128K and Macintosh 512K.

DISCUSSION -----

Following are the data transfer rates for the Macintosh:

Serial Port (external):

AppleTalk:	230.4K baud
Asynchronous:	57.6K baud (maximum rate)
Synchronous:	920K baud (maximum rate with external clock)

Disk Drive Port: 500K baud

68000 Processor Access Rates (internal):

ROM at:	8 MHz
RAM at:	6 MHz

NOTE: The BlockMove Routine in ROM allows you to move blocks of data from one location of memory to another at ROM speed (8 MHz). Otherwise, the normal RAM transfer rate is 6 MHz.

Processing Data Rate

13.3 megabits per second

NOTE: This rate is calculated using the definition in Federal Register,

Volume 49 Number 252, page 50619.

Refer to the Motorola 68000 User's Manual for address calculation times as well as for processing and instruction execution times.

Macintosh 128K and 512K: Using the Calculator and Keypad

=====

Article Created: 8 October 1984
Article Last Reviewed: 27 May 1992
Article Last Updated: 22 December 1989

On the original Macintosh Numeric Keypad, the keys ENTER, comma, plus, and minus do not seem to correspond with the keys on the Calculator desk accessory. However, although the keycap graphics do not match the Calculator keys, there is a calculator function for each keycap. For instance, the ENTER key on the keypad corresponds to the plus key on the Calculator. So, if your fingers are accustomed to a 10-key numeric keypad, you can use the Macintosh keypad and look at the screen and not the keys. Otherwise, please bear in mind the differences between the keys on the Calculator and those printed on the keycaps.

ProDOS: Using /RAM and Double High-Resolution Graphics

Revised: 9/21/84
Security: Everyone

ProDOS: Using /RAM and Double High-Resolution Graphics

=====

Whenever ProDOS is booted, it checks the environment; if ProDOS finds a 128K Apple II system, it configures the auxiliary 64K memory bank as a RAM disk named /RAM. This "disk" is catalogued as slot 3, drive 2, since it's comprised of memory on the 80-column card in slot 3.

If you plan to use this auxiliary memory for high-res graphics, you must protect yourself from /RAM. To construct a space for protecting high-res pages in auxiliary memory while maintaining /RAM as an online storage device, perform the following two steps:

1. Save a "dummy" 8K file as the first entry in /RAM; this file will always be saved at \$2000 to \$3FFF.
2. Immediately afterwards, save a second "dummy" 8K file to /RAM; this file will be saved at \$4000 to \$5FFF.

--> IMPORTANT NOTES:

1. There is no formula for determining where the blocks of /RAM physically reside in memory.
2. The logical blocks in /RAM are not physically contiguous.
3. There is no guaranteed way to protect any other fixed portions of auxiliary memory by means of the "dummy" file method.

If you wish to protect all auxiliary memory not reserved for use by Apple, you must disconnect /RAM. The following three areas of the system global page are of interest to anyone who wishes to disconnect /RAM:

\$BF10-\$BF2F contains the disk device driver addresses.
\$BF31 contains the number of devices minus one.
\$BF32-\$BF3F contains the list of disk device numbers.

ProDOS: Product Overview

Revised: 10/8/84
Security: Everyone

ProDOS: Product Overview

=====

ProDOS is Apple's new disk operating system for the Apple IIe and II+. It is now included with Apple's Disk II drives with controller and the DuoDisk.

Apple designed ProDOS as a transition from DOS 3.3 and for the greater sophistication and enhanced capabilities demanded by more professional applications. ProDOS provides compatibility between the Apple III and the Apple II line of computers, since ProDOS and SOS share similar file naming conventions and file formats.

ProDOS requires a 64K Apple II+ or IIe, with Applesoft in ROM. Integer BASIC is not supported. Listed below are some of the features of ProDOS.

- Hierarchical file system similar to SOS.
- Up to 51 files in a volume directory; the number of files in subdirectories is limited only by the space on the disk.
- 20 different file types; 10 are user-defineable.
- Up to 8 files may be open at one time.
- A defined, usable machine language interface.
- Interrupts up to 4 levels are supported and processed sequentially.
- Compatibility between files created on an Apple III.
- Fast transfer speed to and from disk; about 8K per second from Disk II.
- All disk devices supported by Apple will work automatically.
- Direct block access.
- Enhanced BASIC command structure.
- Easier Assembly Language program development and maintenance.

--Up to 32 megabytes per volume, 16 megabytes per file.

--Multiple logical volumes per physical volume.

--Pseudo disk emulator using the Apple Extended Text Card, enabling fast file access and graphics screen switching.

Apple Color Plotter: Configuring it to an Apple IIe

Revised: 12/16/85
Security: Everyone

Apple Color Plotter: Configuring it to an Apple IIe

=====

The following describes the connection between the Apple IIe and the Apple Color Plotter. DO NOT USE the High Speed Serial Card with the IIe.

I. Apple IIe

1. Super Serial Card (SSC)

A. Circuit Configuration

Near the internal cable (Part 590-0021) of the SSC there is a removable block of pins with a triangle on its top face. Make sure this jumper block is plugged into its socket so that the triangle points to the word TERMINAL printed on the card.

This configuration, called modem elimination, compensates for the standard RS-232-C pin assignments so that the internal cable of the SSC can transmit signals to the Imagewriter through the appropriate pins.

B. IIe Motherboard Slot

- a. Preferred: Slot 1
- b. Range: Any slot EXCEPT AUX

C. SSC Switch Settings

SW1:	1	2	3	4	5	6	7	SW2:	1	2	3	4	5	6	7
				X	X X			X		X					(ON)
	X X X	X							X X	X X X					(OFF)

These switch settings are for: 9600 baud (SW1: 1-4), Printer Mode (5-6), Normal Clear To Send (7), 8 data bits and 1 stop bit (SW2: 1), no delay after CR (2), video off with an 80 character line (3-4), no LF after CR (5), Disabled ACIA-CPU interrupts (6), and Normal Clear To Send (7).

No parity is set automatically in the Printer Mode.

II. The Connection

1. Cable

Serial and Communications Cable (Part 590-0037)

From				To	
Super Serial Card IIf Back panel DB-25 connector				Apple Color Plotter DB-25 connector	
signal	-	pin	wiring	pin	- signal
Frame Ground		1	<->	1	Frame Ground
Tx		2	<->	2	Tx
Rx		3	<->	3	Rx
RTS		4	<->	4	RTS
Signal Ground		7	<->	7	Signal Ground
DTR		20	<->	20	DTR

2. Signal

1. Levels from Super Serial Card:

- a. True (asserted): 0 volts
- b. False: +5 volts

III. Apple Color Plotter

1. Switch settings

1	2	3	4	5	6	7	8	
				X	X	X	X	(ON)
X	X	X						(OFF)

These switch settings are for: 8 data bits (SW 1), no parity (SW 2),
1 stop bit (SW 4-5), 9600 baud (SW 6).

2. Test

- A. Set paper width to 8.5 inches or larger.
- B. Assemble and install pen head.
- C. Turn on Plotter and insert paper to paper set mark.

D. Press pen up/down (test) button.

Plotter will run automatic test routine.

Some applications may not give you all the features of the Apple Color Plotter.

Apple II: "Understanding the Apple II"

=====

"Understanding Your Apple II", an in-depth Apple II and II+ hardware manual, is now available from Quality Software or from your local dealer. The book, by Jim Sather, has a foreword by Steve Wozniak. Some of the book's features:

- Documents all motherboard circuits, including some discussed nowhere else.
- Describes disk controller operation, including previously undocumented details of the logic state sequencer.
- Explains RAM and ROM card operation.
- Reveals previously unnoticed features of Apple graphics.
- Contains 23 software and hardware Application Notes including the shift key mod, disk write protect mod, and EPROM mods.
- Includes a chapter on simple user troubleshooting and maintenance.
- Contains over 100 figures and illustrations, including more than 20 schematics, ten appendices, a glossary and index.

This book runs 352 pages in all! A companion text, "Understanding Your Apple IIe", is also available from:

MPW/MacApp: Versions, availability, compatibility

Revised: 10/5/92
Security: Everyone

MPW/MacApp: Versions, availability, compatibility

=====

MacApp 1.0B2 is compatible with MPW 1.0. In order to use the resource files interchangeably, though, the user must modify resource files as discussed in the paragraphs below.

Using MacApp Release 1.0B2 with MPW Release 1.0

The resource files for MapApp 1.0B2 are not compatible with the standard MPW 1.0 Rez include file Types.r. To compile MacApp, you can either use the MPW 1.0B2 Types.r file or change the MacApp resource files. To change the sample resource files, first replace all occurrences of zoomProc with zoomDocProc, then modify the 'ALRT' resources so that the stages lists have the following format:

```
{  
OK, Visible, Silent;  
OK, Visible, Silent;  
OK, Visible, Silent;  
OK, Visible, Silent  
}
```

MacApp release 1.0 resource files will have the correct format.

The released version of MPW software, which APDA is now shipping, is 1.0. The manuals included with APDA shipments are not final at this point; they are missing the graphics, an index, etc. Final manuals are scheduled to be available this spring; they will be made available through APDA at that time.

DOS 3.3: BSAVEing a High Resolution screen economically in DOS

Revised: 9/21/84
Security: Everyone

DOS 3.3: BSAVEing a High Resolution screen economically in DOS

=====

Since the starting address and length of a binary file are stored as the first four bytes of the file, saving a file with a length of \$2000 actually stores \$2004 bytes and therefore requires one more sector than \$2000 bytes would. You can avoid using that extra sector when you save a High-Res screen by saving it with a length of \$1FF8 instead of \$2000. To do so, use the following syntax when you save a High-Res screen:

```
10 D$ = CHR$(4)
20 PRINT D$;"BSAVE HIRES-1, A$2000,L$1FF8"
30 PRINT D$;"BSAVE HIRES-2, A$4000,L$1FF8"
```

UniDisk 3.5: Two Drives Activate

=====

This article last reviewed: 23 November 1987

PROBLEM DESCRIPTION: Two drives activate when booting the Apple IIGS.

BEFORE YOU START: Reverse the positions of the drives so that the second drive is in the first position and vice versa. Proceed to "CURE" if the drives operate normally after reversing the drive positions. Otherwise troubleshoot the problem using the "Symptom Cure Chart" in "UniDisk Technical Procedures".

CURE: Change the Daisy Chain Interface Board in the drive that was originally in the "Drive One" position.

Lisa: Backing Up Large Files With a ProFile

Revised: 3/25/92
Security: Everyone

Lisa: Backing Up Large Files With a ProFile

=====

Article Created: 21 September 1984
Article Last Reviewed: 25 March 1992
Article Last Updated: 25 March 1992

TOPIC -----

When backing up a ProFile file to a disk I keep getting errors asking for new disks. Why is this happening?

DISCUSSION -----

When you attempt to back up a ProFile file to a disk with a pre-version 3.0 Lisa, you'll have problems if the file is larger than the disk (i.e., >400K): the Lisa continuously asks for new disks in an attempt to find a disk large enough to hold the entire file--which, of course, it never finds. We're told that the problem has been fixed in Version 3.0.

Lisa Peripheral Cards: Responding to error #1222

Revised: 9/21/84
Security: Everyone

Lisa Peripheral Cards: Responding to error #1222

=====

If you have a printer attached to a parallel expansion card in your Lisa and are planning to move that card to another slot (or remove it entirely), you must be sure to open the Preferences window and set the "Device Connection" for the old slot to "No Device" BEFORE you remove the card from that slot. If you move or remove the card without first reconfiguring Preferences appropriately, you'll leave behind a "phantom device connection"--that is, the Lisa will continue to think that there is a printer connected through the old slot. The next time you ask your Lisa to print a document, the Lisa will try to print the document on the "phantom" printer, fail, and end up giving you an "Error #1222" message. If you've received such an error message, your problem may be a phantom device connection. You won't be able to tell for sure, though, simply by opening the Preferences window: Preferences will only list slots that actually have cards in them. Instead, take these steps to discover whether you have a phantom device connection:

- Open any document.
- Pull down File/Print and choose "Format for Printer".
- Select settings for Print Method and Paper Size that don't match any printer you have ever had, such as Daisy Wheel with 14" x 11" paper.
- At the bottom of the dialog box, choose "Tell Me" (or, in Office System 2.0, "Ask Me")
- Click the OK button. A new dialog box will appear labeled "Intended Printer Unavailable" (or, in 2.0, "Intended Printer not in Preferences"). In the middle of the box will be a list of printers next to checkboxes. This list of printers will include any phantom device connections.

To fix the problem, re-install a parallel card in the slot with the phantom connection, open Preferences, set that slot's Device Connection to "No Device", and then remove the card.

FORTRAN: Using FORTRAN 1.0 with Pascal 1.2

Revised: 10/8/84
Security: Everyone

FORTRAN: Using FORTRAN 1.0 with Pascal 1.2

=====

Many Apple II FORTRAN programers have purchased or upgraded their operating system. They have discovered that the new system, the current version of Pascal 1.2, rejects the FORTRAN compiler because it has the wrong version number.

Change the version ID in the FORTRAN Compiler the easy way. Use this program, FORTRANFIX, to modify an Apple II FORTRAN Compiler so that it can be run under Apple II Pascal 1.2 without getting a version error.

Load this entire file into the Pascal Editor. These paragraphs will substitute for the 1K header the editor expects to see at the beginning of a text file. Make NO changes. Quit the editor by choosing "U(pdate the work file and leave". Select "R(un" from the main command line. FORTRAN users, be sure to do this using your Pascal system and not your FORTRAN system.

When the program prompts you, place your FORT2: diskette in drive 1. Upon completion, the FORTRAN compiler will be accepted by the Pascal 1.2 system.

```
program FORTRAN_FIX;
  type Byte      = 0..255;
      Seg_Info = packed record
          Mach_Type: 0..9;
          Filler: 0..1;
          Major_Revision: 0..7;
      end;

  var  Num      : integer;
      ch       : char;
      Buffer: packed array [0..511] of byte;
      F        : file;
      Trix     : record case boolean of
          true : (Temp: packed array [0..0] of Byte);
          false: (SI  : Seg_Info);
      end;

  procedure RESET_FILE (File_Name: string);
```

```
begin

QuickFile: Formatting QuickFile Disks on the IIf

=====

The IIf Compatibility List says to use the Utility Formatter for QuickFile disks; unfortunately, using the Utility Formatter doesn't put the QuickFile catalog file on the disk. To work around this problem, copy any QuickFile data disk (such as the Sample Files disk) and then, using QuickFile, remove all the files from the catalog.

QuickFile III: Merging Files

Revised: 1/20/86
Security: Everyone

QuickFile III: Merging Files

=====

Even though QuickFile doesn't offer you the option of merging files, it does give you a foot in the door by letting you print reports to diskette. To merge files in QuickFile:

First, design a "labels" format that prints each field of a record one below the other, with no blank lines between labels. Even if a field is blank, choose to print lines on continuous paper with no top or bottom margins and no headers. This will result in a file of contiguous, identically-structured records. Be sure that the files have the same number of fields in each record; control this number with the report format. The names of the fields are irrelevant. After the files you want to combine are printed to diskette, use AppleWriter, Pascal Editor, or a similar text editor to combine the files and re-save them to diskette as one file.

Apple III users with Pascal can then make an EXEC file that starts up QuickFile and creates a new file. You must create a new file, though: you can't jump right into an existing file, since the EXEC mechanism cannot recognize and record the OA-I you need in order to go into Insert Mode. Don't terminate (%%) the EXEC file until QuickFile is waiting for input of the first field of the first record of the new file. After terminating the EXEC file, quit QuickFile. Don't save this new file, though. Using your text editor again, load the EXEC file, and then load your combined file (see above) into the position just before the "%%". Again save the file. Executing this file will cause a new QuickFile file to be created, and all of your data will be "typed" in by the disk drive.

Apple Writer Iie: DOS version--Patch for the Ilc

Revised: 2/18/86
Security: Everyone

Apple Writer Iie: DOS version--Patch for the Ilc

=====

Following is the Apple Writer II Utility Program which updates, for running on an Apple Ilc, the DOS 3.3 version of Apple Writer for the Iie only.

To use this patch on your system, start by capturing the BASIC code listed below, using MacTerminal and Access II (DOS 3.3).

Remember to capture ONLY the BASIC code portion of this message. As an alternative, you could capture the entire message and then edit out the unwanted portions with a text editor. Save the file as a standard DOS 3.3 text file with the name PATCH.TEXT. Type the following from the keyboard:

```
EXEC PATCH.TEXT
```

You will see several "]"s scroll by at this point. When this stops and the cursor returns, type:

```
SAVE PATCH APPLEWRITER IIE
```

```
RUN PATCH APPLEWRITER IIE
```

Insert your Apple Writer II master disk and press the Return key. You only need to update your Apple Writer disk once.

After updating your Apple Writer Iie disk, mouse characters will appear on the screen, but only when capital letters are shown in inverse--for example, a capitalized file name appearing on the data line, or when the blinking cursor moves over a capital letter.

NOTE: The utility program does not convert Apple Writer to run under ProDOS.

```

Security: Everyone

Macintosh and Macintosh SE Video Alignment Aid

=====

Using MacDraw and a LaserWriter, one can make an easy to use alignment aid for doing Macintosh video alignments. Make a rectangle using MacDraw that is 7 inches by 4.7 inches. Print this on a LaserWriter using overhead transparency material. Trim the excess material so that the template fits on the Macintosh screen. It will usually stick to the screen because of static electricity, but it can also be secured by using double-sided tape. Just be sure to use overhead transparencies that are made for use in a laser printer.

WPL: How to make AUTOLETTER use surnames

Revised: 4/23/86
Security: Everyone

WPL: How to make AUTOLETTER use surnames

=====

Make these modifications to the WPL program Autoletter on page 96 of the AppleWriter III manual as follows:

```
BEFORE
-----
L .D1/ADDRS!<(X)>!<!N
PGO FOUND
PGO QUIT
FOUND PLS .D1/ADDRS!<(X)>! !N=$A
```

```
AFTER
-----
L .D1/ADDRS!<(X)>!@!N
PGO FOUND
PGO QUIT
FOUND PLS .D1/ADDRS!@(X)@!<!N=$A
```

Then modify your address file as below:

BEFORE	AFTER
-----	-----
<1>John Smith	<1>John Smith
1234 Elm Street	1234 Elm Street
Anytown, USA 12345	Anytown, USA 12345
<2>Jane Doe	@1@Mr. Smith<2>Jane Doe
5678 Main Ave.	5678 Main Ave.
Nowhere, Indiana 98765	Nowhere, Indiana 98765
<	@2@Ms Doe<

There are other methods of achieving the desired result, but this one is easy and it affords the flexibility of using a different "dear" name than the first line of the address (i.e., Company Name on the first line of the address).

This method also works quite well with Apple Writer II & IIe. For the file name path .D1/ADDRS, substitute ADDRS,D1 for DOS or simply ADDRS for ProDOS.

Applesoft: Simple Ways To Protect Programs

=====

This article last reviewed: 26 September 1989

Some programmers prefer to conceal their code from inquisitive users. Keep in mind that if users are determined to LIST a program, they will. Be that as it may, here are a few obstacles to deter less tenacious users.

To prevent a user from LOADING your program in the first place, type control characters in the name of the program when you save it. These characters cannot be seen in a CATALOG. However, users may know of a program in the DOS manual that they can use to find control characters in your program's name and modify it.

By the techniques below, you will discourage most attempts by preventing Applesoft from executing a LIST command properly.

Disable the LIST command by placing POKE 214,128 in the first statement line of the the startup program HELLO. Once this command is executed, any Applesoft command is interpreted as RUN. When the user types LIST, the program RUNs. If NEW is entered, the program RUNs. Whenever the value of memory location 214 is greater than 128, your program will do nothing but execute.

NOTE: On some systems, a CTRL-RESET keystroke may disable the POKE 214,128 that is essential to this technique. To disable the RESET key, use POKE 1010,102: POKE 1011,213: CALL -1169 in your startup program, preferably on the second statement line.

With this arrangement, the program re-runs itself every time the user presses a CTRL-RESET.

CAUTION: These POKES disable DOS; therefore, after the startup program runs, your program is unable to execute DOS commands such as "LOAD", "SAVE", and so on, unless your program enables the RESET key with the statements POKE 1010,191: POKE 1011,157: CALL -1169.

While this technique prevents a LOAD and LIST on a single drive system, someone

with a multi-drive system could boot DOS and then LOAD and LIST the program from a second drive. There is still another protection the program can contain. You can program a DOS command to execute when your program is LISTed without affecting a RUN of the program. Within the listing, you program a DOS command to CATALOG the disk, reboot, or lock or delete files, just as though the command had been typed at the keyboard. Following the execution of the DOS command, the listing will disappear.

Here is a sample of this technique. Be sure to save any program you modify before using this method.

1. Load a Basic program into memory.
2. Add a remark as the new first line of the program. After the word REM, type 3 spaces and a DOS command, such as CATALOG, PR#6, DELETE filename, and so on.

Example: 10 REM CATALOG (three spaces between REM and CATALOG)

3. From the keyboard, enter: POKE 2055,13 : POKE 2056,4
4. Save this revised version of your program with a unique name.
5. Now type LIST.

The Apple will begin to list your program, but will stop the listing to execute the DOS command and CATALOG the disk. No further program statements will be seen. Experiment with various DOS commands to get the desired effect.

NOTE: Anyone distributing software for sale running on an Apple computer should become licensed through Apple Software Licensing. Search on Software Licensing for address information.

AppleWorks 1.3 & 2.0: Won't Correctly Skip Pages When Printing

=====

This article last reviewed: 3 December 1987

In AppleWorks' word processor, there are occasional printing problems when there is a page break in the middle of an indented paragraph. If you use the options menu (Open-Apple-O) to specify a paragraph indent of more than nine characters, AppleWorks may fail to skip to a new page when it should.

Two workarounds:

- For paragraph indents greater than nine characters, insert nine spaces instead of using the Indent command in the Options menu.
- Insert a carriage return on the line before the desired page break, creating two paragraphs, one before and one after the page break. (Indent the first line of the new second paragraph so it will line up with the rest of the text.

Apple Iic, Iic Plus And Iie: Interfacing To An RGB Monitor

=====

This article last reviewed: 8 November 1988

To interface an Apple Iie, Apple Iic, or Apple Iic Plus to a digital RGB color monitor, you must get an interface card, as well as a device called a Peacock, model CM2C. This device is available from Telex Inc.

For more information, search under: "Telex Inc."

To interface an Apple Iie to an analog RGB color monitor, you'll need something like the RamWorks memory card and the ColorLink RGB card, both available from Applied Engineering.

For more information, search on "Applied Engineering".

Pascal III: RPS File Space Allocation

Revised: 3/2/88
Security: Everyone

Pascal III: RPS File Space Allocation

=====

This article last reviewed: 21 September 1984

The Apple III Pascal RPS unit usually creates two SOS files for each RPS file; moreover, your SOS file with the .I (index) may be listed as having too many blocks compared to the disk space available. This file functions well, except that you're unable to copy this file to another disk regardless of the amount of room on the destination disk. Attempts to copy this file will give you a "NO ROOM ON VOLUME" error.

RPS uses "sparse files", files that are logically larger than the actual number of blocks required to store the information. Since early versions of SOS (pre SOS 1.3) did not know about sparse files, they will copy the files without errors.

Another example of a sparse file is a Business BASIC random access file having a record length of 1024, but only using record 1 and record 1000. Logically, this file requires 2002 blocks; actually, only 6 blocks are used. Again, an early version of SOS will copy the file.

Changing I/O Vectors in DOS and ProDOS

Revised: 10/23/84
Security: Everyone

Changing I/O Vectors in DOS and ProDOS

=====

To change your I/O hooks when programming under DOS, install your I/O routine addresses in the character-out vector (\$36-\$37) and/or key-in vector (\$38-\$39); then, notify DOS (JSR \$3EA) to take your addresses and swap its intercept routine addresses in.

When programming under ProDOS, leave the ProDOS BASIC Command Interpreter's intercept addresses installed in \$36-\$39; install your I/O addresses in the global page at \$BE30-\$BE33. \$BE30-\$BE31 should contain the output address (normally \$FDF0: the monitor COUT1 routine), whereas \$BE32-\$BE33 should contain the input address (normally \$FD1B: the monitor KEYIN routine).

Keep those vectors in a global page so the special routine (JSR \$3EA) for moving the vectors won't be needed; just install your addresses at their destination yourself.

Apple II Peripheral Cards: Sending TABs to your Printer

Revised: 11/12/85
Security: Everyone

Apple II Peripheral Cards: Sending TABs to your Printer

=====

Problems you may have sending TAB commands to your printer may stem from the interface cards "trapping" the <CTRL-I> before it goes to the printer.

To send a TAB to a DMP from an Apple IIe using a Parallel Interface Card:

Change the I/F card command character to something other than <CTRL-I>.

```
10 I$ = CHR$(9): Q$ = CHR$(17)
15 PRINT I$; Q$: REM command char for card is now CTRL-Q
20 PRINT I$: REM this sends the TAB
```

Reference: Parallel Interface Card Manual, p.12

To send a TAB to an Imagewriter from an Apple IIc:

First send <CTRL-I>Z to "zap" future commands. The I/F card will ignore following <CTRL-I>'s.

```
10 I$ = CHR$(9)
15 PRINT I$;"Z": REM zap
20 PRINT I$: REM this sends the TAB
```

Reference: Apple IIc Reference Manual, section 7.1

To send a TAB to an Imagewriter from an Apple IIe using a Super Serial Card:

Send the TAB character twice or "zap" as with the Apple IIc.

```
10 I$ = CHR$(9)
15 PRINT I$;I$: REM this sends the TAB
```

Reference: Super Serial Card Manual, page 12

BASIC's TAB command doesn't work properly with either the (old) High Speed Serial Interface or the Apple Silentype. Integer BASIC it is limited to 40 columns, while a TAB(20) in Applesoft will sometimes output 20 spaces

instead of going to column 20. An example that gets around this is:

```
10 PRINT "HI";:POKE 36,55: PRINT "THERE"
```

POKE 36,55 will put the "THERE" in the 56th column (remember, Apple counts columns from 0 to 79) while still printing "HI" in column 0.

Following is a sample program that dealers can show to customers:

```
10 PRINT CHR$(4);"PR#1" :REM TURN THE PRINTER ON WITHOUT DISCONNECTING PRODOS
20 PRINT CHR$(9);CHR$(1) :REM SWITCH THE CONTROL CODE FROM CTL-I TO CTL-A
30 PRINT CHR$(27);"(010,020,030.":REM SET UP THE TAB LOCATIONS
40 I$=CHR$(9)
50 PRINT I$;"TEN";I$;"TWENTY";I$;"THIRTY":REM SEND THE LINE WITH TAB'S
60 PRINT CHR$(4);"PR#0":REM TURN OFF THE PRINTER
```

Apple Iic: Battery packs

Revised: 3/4/85
Security: Everyone

Apple Iic: Battery packs

=====

Two battery packs available for the Apple Iic are listed below. Both battery packs support many hours of continuous use and will also act automatically as an auxiliary power source in the event of a power failure.

The Cari Portable Work Station by Discwasher measures 19 x 12 x 8 inches, is made out of cordura nylon and provides up to 6 hours of continuous power. It's big enough to carry an Apple Iic with the Flat Panel Display attached, as well as the Apple Iic Power Supply, a mouse, manuals, software and additional papers. The suggested retail price is \$249.95. For further information, contact:

Maurice Evans
Discwasher Products Inc.
1407 North Providence Road
P.O. box 6021
Columbia, MD 65205
(314) 449-0941

The Prairie Power battery case is 17 x 13.5 x 5.25 inches and is also made of cordura nylon. The removable battery pack and built-in charger provide up to 8 hours of power without recharging. Separate padded compartments are provided for the battery pack, software and the Flat Panel Display. The suggested retail price is \$269.95. For further information, contact:

Maureen Olson
Prairie Power Systems, Inc.
(612) 475-1793

Both products have a briefcase-type handle as well as a removable shoulder strap. The combined weight of a battery pack, Apple Iic and Flat Panel display is about 20 lbs.

Apple III: 12-volt 128K Internal Diagnostic

Revised: 11/8/88
Security: Everyone

Apple III: 12-volt 128K Internal Diagnostic

=====

This article last reviewed: 7 November 1988

There is a RAM diagnostic built into the monitor ROMs of all Apple IIIs that's useful for testing the memory of a 12-volt 128K Apple III (typically, Apple IIIs with serial numbers less than 100,000).

NOTE: Before running this test, remove all peripheral cards from the Apple III, especially any ProFile interface cards and Grappler printer cards.

To run the diagnostic:

1. Hold down the CTRL and OA keys, and then press and release RESET key. The MONITOR prompt, a right arrow and a flashing underline, should then appear in the upper left corner of the screen.
2. Type F6E6G and then press the RETURN key.
3. The test should now begin to cycle: in the upper left hand corner of the screen you'll see, about every 20 seconds, a pattern of dots like this:

```
DIAGNOSTIC RAM
. . . . .
. . . . .
. . . . .
. . . . .
. . . . .
. . . . .
. . . . .
. . . . .
```

If the test runs for 20 minutes and displays only dots, the RAM isn't defective. If characters or inverse blocks show up in the matrix, however, the diagnostic has found defective memory chips.

The position of the non-dot character in the display (usually an inverse "1")

above corresponds with the chart below, which lists the chip location on the 12-volt memory board.

B9	B8	B7	B6	B5	B4	B3	B2
B17	B16	B15	B14	B13	B12	B11	B10
B9	B8	B7	B6	B5	B4	B3	B2
B17	B16	B15	B14	B13	B12	B11	B10
C17	C16	C15	C14	C13	C12	C11	C10
D9	D8	D7	D6	D5	D4	D3	D2
D17	D16	D15	D14	D13	D12	D11	D10
C9	C8	C7	C6	C5	C4	C3	C2

Replace the bad memory chip(s) and run the test again. If the system once again fails the memory board test, replace the memory board itself. If that doesn't help, replace the main logic board. (Error messages displayed below the DIAGNOSTIC RAM grid, by the way--such as "ACIA", "ROM", or "VIA"--indicate a problem with the logic board.)

Apple Access II version 1.2: Specifications (Discontinued)

Revised: 9/10/93
Security: Everyone

Apple Access II version 1.2: Specifications (Discontinued)

=====

Order #: A2D4503

--Technical Specifications

Connections:

1. RS-232 port with modem
2. direct connection with another computer

Baud rates: up to 9600

Terminal Emulations:

1. TTY
2. ANSI (VT100)
3. VT52

Protocols: Christensen

--System Configuration

1. Apple IIc, Apple II GS or Apple IIe with Super Serial Card in Slot 2 and one disk drive
2. Modem
3. Another computer or terminal
4. Options: 80-column Text Card, Extended Memory, Printer, ProFile

NOTE: Apple Access II will NOT work with the following equipment:

1. Apple II or II Plus
2. Apple III in Apple II emulation mode.
3. A modem for the Apple IIe which has its own interface card.

--Features

- Sends or receives any type of ProDOS file
- Incorporates AppleWorks user interface
- Automatic communications and full disk support, including file transfer
- Supports all features of the Apple Modems including automatic dialing

..TIL00216-Apple_Access_II_version_1-2-Specifications_Discontinued.pdf

--Supports automatic log on for remote computers and services including:

1. Dow Jones
2. CompuServe
3. The Source

--Does NOT support split speed transmissions (sending at one rate and receiving at another)

FORTRAN: Understanding Code Write Error

Revised: 10/23/84
Security: Everyone

FORTRAN: Understanding "Code Write Error"

=====

Insufficient room on a diskette to save a file is the most common cause of a "Code Write Error." A file name having more than ten characters (not including the prefix or suffix) also causes this error; this error is easy to detect, though, since the error message is displayed before the drive is accessed. A third cause is the disk directory having more than 51 file names.

When A)ssembling, C)ompiling or L)inking, the largest consecutive disk blocks are allocated for the code file. If the disk is new or recently Krunched, the system creates a temporary Linker.Info file while running; upon attempts to open the Linker.Info file, you'll get a code write error.

To avoid this error, enter the F)iler to check your disk space. If your disk shows plenty of space, M)ake two files: the first file you create should be 8 blocks in size, while the second should be 1 block in size. Next, delete the first file. These steps segment the disk file space leaving 8 blocks open for the Linker.Info file.

If an error occurs when using the "include" file option, M)ake a 4 block file named SYSTEM.SWAPDISK on the volume where the compiler resides, allowing the compiler to swap out some information in order to read in the new directory for the include.

FORTRAN: Sending Compiler Listings to the Console

Revised: 10/23/84
Security: Everyone

FORTRAN: Sending Compiler Listings to the Console

=====

While an asterisk (*) specifies the console under Apple FORTRAN, FORTRAN I/O operations take place within the Pascal operating system, where the asterisk has an entirely different use.

DO NOT TYPE AN ASTERISK (*) in response to the "LISTING?" prompt when using the FORTRAN compiler. Otherwise, the system will appear to compile, then damage your FORTRAN 2 diskette, severely crippling the operating system.

Type "CONSOLE" to display the listing on your video monitor.

QuickFile: Left-Justifying Labels

Revised: 10/23/84
Security: Everyone

QuickFile: Left-Justifying Labels

=====

When printing mailing labels from QuickFile, it's sometimes desirable to place an optional title (e.g., Mr., Mrs., Mr. & Mrs.) in front of the name. The following example:

```
Title  <First Name  <Last Name  
Street Address  
City/State/Zip
```

will indent the first line of every mailing label that doesn't contain a title 3 spaces. The following example solves the indenting problem.

```
<Title  <First Name  <Last Name  
<Street Address  
<City/State/Zip
```

The trick is to get the left-most field left-justified. Since QuickFile won't let you OPEN-APPLE-J the left-most field, move the left-most field to where it is not left-most, OPEN-APPLE-J it, then move the line back to its left-most position. This causes all occurrences of this line to be preceded by 3 spaces. OPEN-APPLE-J the rest of the lines you wish to straighten out.

International Versions of Lisa Software

Revised: 7/30/87
Security: Everyone

International Versions of Lisa Software

=====

International versions (beginning with release 2.0) of the Lisa Office System differed from the U.S. versions only in the language used in the alert boxes, menus, etc.

One version of the Workshop was available worldwide. For example, France did not have a "French" version of the Workshop -- available to France was the same English version distributed to all countries.

Apple IIe Hardware: Dvorak Keyboard Layout

Revised: 5/25/89
Security: Everyone

Apple IIe Hardware: Dvorak Keyboard Layout

=====

This article last reviewed: 8 November 1988

The Dvorak keyboard layout, an option available on the Apple IIe and Apple III, is popular with many typists.

Apple IIe:

The Dvorak keyboard layout is available on the revision "B" Apple IIe main logic boards. If the user prefers the Dvorak layout over the standard QWERTY, a minor modification can be made to the logic board.

The first--also the most versatile--method is to solder the main logic board "X3" jumper located at board coordinate B14, tying the character generator select line to the annunciator #2 address. The system follows the Dvorak layout until the QWERTY layout is invoked with POKE 49244,0 (annunciator #2 off). To revert back to the Dvorak layout, POKE 49245,0 (annunciator #2 on) or press CTRL-RESET. At power-on, the system defaults to the Dvorak layout.

Alternatively, jumper the "J19" solder pads together; this method, however, prevents you from toggling to the QWERTY layout. If, instead, you solder a two-pin Molex connector (available from electronics parts stores) at J19, a shorting block, similar to the one used on the Apple IIe Extended 80-Column Text Card, could be used to switch from the Dvorak to the QWERTY layout.

After making the modification of your choice, remove the video ROM (location F4) from the main logic board. Bend pin #18, then re-insert the ROM, with pin #18 sticking out to the side instead of into the socket..

All of these modifications may void your warranty if a problem occurs as a result of improper modification--that is, poor solder job, pins bent on the wrong chip, chip plugged in backward, etc.--so be very careful.

Apple III:

Because the Apple III is a software driven machine, the Dvorak keyboard layout is enabled by "programming" the keyboard; this is done with the System Configuration Program on the System Utilities diskette. The Dvorak layout data is on the System Utilities Data diskette included in the System Utilities package.

To enable the Dvorak layout for a particular diskette:

1. Start up the System Utilities: select "System Configuration Program" from the main menu.
2. Select "Read A Driver" from the next menu.
3. Remove the Utilities diskette: insert the diskette you wish to modify into drive 1.
4. Press RETURN to read the SOS.DRIVER file.
5. Place the Utilities diskette back into drive 1.
6. Select ESCAPE to go back to the menu: choose "Change System Parameters".
7. Remove the Utilities diskette: insert the Utilities Data diskette in drive 1.
8. Select "Keyboard Layout": Type /UTILITIES.DATA/KEYBOARD.LAYOUT/DVORAK; press RETURN.
9. Place utilities diskette back into drive 1: press ESCAPE twice to return to the menu.
10. Select "Generate New System".
11. When system validation is complete, put the diskette you wish to modify into drive 1. Type .D1/SOS.DRIVER, then press RETURN. If you get a verification question here, answer "yes". You must remove the write-protect tab at this time, and you must unlock the SOS.DRIVER file (a function of the FILE HANDLING COMMANDS submenu).

Apple IIe and Apple III:

The final step is to rearrange the keycaps. At present, Apple does not offer the Dvorak keycap set. Because the keycap contours conform to the QWERTY layout, you will find your keyboard somewhat "lumpy".

Pascal III: SOS Error Codes

Revised: 10/23/84
Security: Everyone

Pascal III: SOS Error Codes

=====

Following is a list of errors codes available to the Pascal programmer from the Apple III's Sophisticated Operating System (SOS).

-----> Pascal Errors

0	No error; normal I/O completion
1	Out of filename storage space
2	Bad unit number
3	Illegal operation (e.g. read from PRINTER:)
4	Illegal directory spec
5	Lost unit; no longer on line
6	Lost file; file no longer in directory
7	Illegal pathname
8	No room; insufficient space on diskette
9	No unit; unit not on line
10	No such file in specified directory
11	Duplicate pathname
12	Attempt to open an already open file
13	Attempt to access a closed file
14	Bad input format; error in reading number
15	Wrong disk format
16	Write protect error; diskette is protected

-----> SOS Device Call Errors

32	(SOS) Invalid request code
33	(SOS) Invalid control/status code
34	(SOS) Invalid control/status parameter list
35	(SOS) Character device not open
36	(SOS) Device not available
37	(SOS) Resource not available
38	(SOS) Invalid operation
39	(SOS) I/O error
42	(SOS) Checksum error
43	(SOS) Device write protected
44	(SOS) Byte count not a multiple of 512
45	(SOS) Block number too large
46	(SOS) Diskette has been switched

48..63 (SOS) Device specific error

-----> SOS File Call Errors

64 (SOS) Invalid pathname syntax
65 (SOS) Too many character files open
66 (SOS) Too many block files open
67 (SOS) Invalid file reference number
68 (SOS) Path not found
69 (SOS) Volume not found
70 (SOS) File not found
71 (SOS) Duplicate file name
72 (SOS) Overrun on volume
73 (SOS) Directory full
74 (SOS) Incompatible file format
75 (SOS) Unsupported file storage type
76 (SOS) Attempted read past end of file
77 (SOS) File position out of range
78 (SOS) Access not allowed
79 (SOS) User supplied buffer too small
80 (SOS) File busy
81 (SOS) Volume format neither SOS nor Apple II
82 (SOS) Not a SOS volume
83 (SOS) Invalid length parameter
84 (SOS) Out of memory for SOS system buffer
85 (SOS) Buffer table full
86 (SOS) Invalid system buffer parameter
87 (SOS) Duplicate volume error
88 (SOS) Not a block device
89 (SOS) Invalid level
90 (SOS) Invalid bitmap address found on volume

-----> Utility Call Errors

112 Invalid Joy_Mode parameter

-----> System Call Errors

123..127

-----> Memory Call Errors

240 Invalid segment address
241 Segment request denied
242 Segment table full
243 Invalid segment number
244 Segment not found
245 Invalid Search_Mode parameter
246 Invalid Change_Mode parameter
247 Invalid pages parameter

ProDOS: The Machine Identification Byte

Revised: 10/23/84
Security: Everyone

ProDOS: The Machine Identification Byte

=====

The environment is checked when ProDOS is booted, constructing the machine identification (MACHID) byte stored at \$BF98 (49048). Programs operating in the ProDOS environment save time and space by referring to this byte when necessary; the MACHID byte identifies these system attributes:

Bits 7-6: 00=II; 01=II+; 10=IIe; 11=III Emulation

Bits 5-4: 00=Unused; 01=48K; 10=64K; 11=128K

Bits 3-2: Reserved for future definition

Bit 1: 1=80-column card; 0=None

Bit 0: 1=Thunderclock or equivalent; 0=None

Lisa Hardware: Video State ROM

Revised: 11/8/88
Security: Everyone

Lisa Hardware: Video State ROM

=====

This article last reviewed: 8 November 1988

If you're unable to print to a printer which previously worked with your system, the Lisa's Video State ROM, part number 341-0229, may be defective.

To check for a defective Video State ROM, follow these steps:

1. Verify the proper configuration of Preferences with the printer switches and check the connection of the cables.
2. Borrow a functioning Lisa Video State ROM and ProFile from another system, then try to print again.
3. If your system now prints, replace the borrowed ROM with the original ROM.
4. If the problem persists, check the printer switches, cables, and Preferences. once again as well as the printer itself.
5. If the problem still occurs, you will have to apply to your local Technical Support address for a new Lisa Video State ROM. There is no charge for this ROM.

The Technical Support people will need the AppleNet number and the ROM's serial number. While the Lisa's serial number may be found on the serial number sticker located underneath the left corner of the CRT, you must also get the AppleNet number. You can get both these numbers from the Lisa by placing it in service mode and using the Lisa's Service Mode to read the numbers encoded on the serialized PROM.

IMPORTANT: If the CPU board is ever replaced on a system, be sure to take the Video State ROM from the old board and install it in the replacement board.

--> Placing the Lisa in Service Mode

1. After starting up your Lisa,
 - a. press either the SPACEBAR after hearing the audible "click" and before the "double-click",
 - or else
 - b. press the spacebar during the memory board test.
2. REMOVE any diskette from your drive, then select option 2 from the displayed "STARTUP MENU". A dialog box will display on the screen informing you there is no disk (as expected) in your drive. You are starting the Lisa from an unattached device: i.e., booting from upper drive when there is no disk in that drive.
3. After the Lisa gives you this error message, hold down the Apple key while you press the "S" key. The Lisa enters the Service Mode and displays the Service Mode menu.

--> Obtaining the Serial Number and AppleNet number with Service Mode

1. Select display memory - "Display Mem"
2. When prompted for ADDRESS, type 240 <CR>.
3. When prompted for COUNT, type 20 <CR>.

The Service Mode window then looks something like this:

```
00000240    0F0F 0002 0802 0002 0000 0400 0300 0F0F
00000250    0000 0100 0004 0102 0002 0900 0000 0000
```

The serial number is embedded in the top 16-byte memory location, which the window displays as 16 hexadecimal pairs, 0F... and so on. Each hexadecimal pair is divided into two halves or "nibbles", e.g., the hex number 0F consists of nibble 0 and nibble F. The second nibble of each of the 16 hexadecimal pairs forms the basis for the serial number.

4. First remove every other nibble like this:

```
00000240    0F0F 0002 0802 0002 0000 0400 0300 0F0F
          240      F F  0 2  8 2  0 2  0 0  4 0  3 0  F F
```

5. Then group the numbers as follows:

Number of the Nibble in Hex	01	23	45	678	9ABC	D	EF
Address	240						
		FF	02	82	020	0403	0 FF
		XX	PP	YY	DDD	SSSS	X XX

Extract the serial number from this group of 16 nibbles as follows:

- a. Ignore nibbles 0,1,D,E and F, marked as XX or X above.

- b. Nibbles 2 and 3 are the two digit plant code (PP).
- c. Nibbles 4 and 5 are the two digit year code (YY).
- d. Nibbles 6, 7 and 8 are the day of the year code (DDD).
- e. Nibbles 9 thru C are the 4 digit serial number (SSSS).

You would submit this serial number, 02820200403, to Technical Support in the Lisa form B02B820200403, where the letter B merely 1) separates the plant and year codes and 2) precedes the entire number.

6. The Applenet Number is similarly embedded in the first 8 bytes of the next line of the memory dump. So, using the same method as step 4 above, we get:

```
00000250    0000 0100 0004 0102 0002 0900 0000 0000
      250      0 0  1 0  0 4  1 2  0 2  9 0  0 0  0 0
```

Number of the Nibble in Hex 012 34567 89ABCDEF

```
Address          250                001 00412 02900000
                                   PPP NNNNN XXXXXXXXX
```

7. To extract the Applenet Number:

- a. Ignore nibbles 8 through F, marked as XXXXXXXXX above.
- b. Nibbles 0, 1 and 2 are the AppleNet prefix (PPP).
- c. Nibbles 3 thru 7 are the AppleNet number (NNNNN).

You would submit this AppleNet number, 00100412, to Technical Support with the Lisa Video State ROM serial number to obtain a new ROM at no charge.

Apple Speller: Product Description

Revised: 10/23/84
Security: Everyone

Apple Speller: Product Description

=====

The Apple Speller III program provides quick, reliable spelling verification and vocabulary analysis of documents produced by any word processing software compatible with the Apple III system (except CP/M or emulation-mode software), including Apple Writer III and the Pascal III Text Editor. It verifies the spelling of every word in your document with an up-to-date Random House dictionary containing more than 78,000 words. Auxiliary dictionaries contain an additional 3400 words categorized as geography, names, abbreviations and figures. There are a variety of ways to customize these dictionaries to simplify your dictionary maintenance. You may add your own words to a new or existing dictionary, add or subtract one dictionary from another, or delete a dictionary you no longer need.

Apple Speller can be used with a 128K Apple III single disk drive system, but two drives are recommended to minimize diskette-swapping. The program's speed and performance is further enhanced on a 256K system or by using a ProFile. The Apple Speller manual doubles as a tutorial and is informative and useful.

ProDOS: Using CONVERT with one drive

Revised: 10/23/84
Security: Everyone

ProDOS: Using CONVERT with one drive

=====

Converting from ProDOS to DOS 3.3 is easy with one drive; however, you'll most likely want to convert DOS 3.3 files to ProDOS.

When converting your file from DOS to ProDOS using a single drive, the Convert program reads the DOS file, displays the error message "cannot find the ProDOS volume", flags the file with an error and quits.

The work-around is: first, convert any file, even a short "dummy" file, from ProDOS to DOS; upon completion of the ProDOS to DOS transfer, change the direction of conversion, then follow the prompts for when to exchange the diskettes.

Don't use your ProDOS User's Disk as your destination disk; otherwise, you'll receive a Disk Full error message, due to the lack of room on the ProDOS User's Disk. Also, don't forget to change the ProDOS prefix to the new volume name. After all the files are transferred to ProDOS, delete the dummy file.

Below are the specific steps:

1. Startup ProDOS with "/USERS.DISK".
2. Select "C": DOS <-> PRODOS CONVERSION.
3. Select "C": Change DOS 3.3 Slot and Drive.
4. Set DOS 3.3 slot to "6", Drive to "1".
5. Place a ProDOS diskette, containing any file, into Drive. Lets assume the program name is "DUMMY".
6. Select "P": to set ProDOS Prefix.
7. Select "S": by Slot and Drive.
8. Set ProDOS Slot to "6": Drive to "1". /TRANS is the prefix used in

this example.

9. Select "R": Reverse Direction of Transfer.
10. Select "T": Transfer (or List) Files.
11. When asked What ProDOS file(s)? Type in "/TRANS/DUMMY"; press RETURN. You'll be prompted to change diskettes several times for large programs.
12. After the transfer to DOS 3.3 is complete, press Escape to return to the menu.
13. Press "R": Reverse Direction of Transfer.
14. Select "T": Transfer (or List) Files.
15. Remove ProDOS diskette; insert your DOS 3.3 diskette
16. Type in name of DOS 3.3 file to transfer; press RETURN
17. You will get "Error: Volume Not Found". Insert ProDOS diskette; press RETURN.
18. Remove DOS 3.3 diskette. Insert ProDOS diskette; press RETURN
19. The file now transfers. To transfer other files: repeat steps 14 - 19.

SoftCard III (CP/M): Moving Files from Apple II CP/M

Revised: 10/23/84
Security: Everyone

SoftCard III (CP/M): Moving Files from Apple II CP/M

=====

Application software often uses direct cursor addressing, enabling you to access specific portions of your display screen. Since a variety of computers use CP/M software, the program diskette itself, or an accompanying utility diskette, often contains a menu allowing to you conveniently configure the software for your system. The item you select from the menu informs the system to send the appropriate command to your system to achieve the desired screen effect.

Many CP/M programs for sale work with the Apple II CP/M systems; however, since the Apple III is relative newcomer to the CP/M world, applications may have to be formatted to operate with it. To format an Apple II CP/M program onto an Apple III diskette:

1. Boot with the Apple III "CP/M Master" Diskette.
2. When you see the prompt A>: type "COPY".
3. When the copy program prompts you with a "*": remove the Master Diskette from you disk drive: insert the Apple II diskette.
4. Place a blank diskette into drive 2.
5. Next type: "B:=A:/S/V".
6. When advised that the operation is complete, and asked if you want another operation: insert the Apple III CP/M Master Diskette into drive 1: type "N".
7. When you see the input prompt A>: type "PIP".
8. Upon prompted with a "*": type "B:DRIVER.SOS=A:". (This will transfer a copy of the driver file to the new diskette).

The resultant copy will be an Apple III system diskette containing all the Apple II files.

AppleColor Monitor 100: Specifications (Discontinued)

=====

NOTE: This product is no longer available
--Technical Specifications

CRT:

- 12-inch diagonal nonglare screen
- high-contrast display with 90 degree deflection
- 16 different colors
- 80-column by 24-line text display

Resolution: 600 TV lines at center, 416 TV lines at corners.

Data Input Signal: RGB with negative-going synchronous

Scan Rates:

- Horizontal: 15.7 KHz
- Verticle Bandwidth 25 MHz
- Video Bandwidth: 25 MHz
- Dot Pitch: .38 mm

Temperature Range:

- Operating: 41 to 86 degrees F (5 to 30 degrees C)
- Storage: -31 to 140 degrees F (-35 to 60 degrees C)

Power Requirements: 117 V AC; 50/60 Hz; 70 watts

Physical Cabinet: ABS plastic (color coordinated with Apple IIe and Apple III Plus)

Dimensions:

- Width: 14.6 in. (37.1 cm.)
- Height: 11.3 in. (28.8 cm.)
- Depth: 14.8 in. (38.3 cm.)
- Weight (including packing materials): 33 lbs. (15kg.)

Controls/Connectors:

Front Controls:

- Power On/Off
- Brightness
- Contrast
- Green-Only Switch
- Tilt Adjust

Rear Controls:

- Vertical Size
- Vertical Hold

Input Connectors:

- Power cord connector
- video signal input (DB-15 plug)

--Package

1. AppleColor Monitor 100
2. Power cord
3. Video cable assembly
4. User's Manual
5. Warranty and product registration card

--System Configuration

1. Apple II Computer with an Apple Extended 80-Column Text/AppleColor Card, or an Apple II or Apple II Plus computer
NOTE: Motherboard 820-0064-A does not support an RGB monitor 100.
If this is your Motherboard you should have it upgraded.
2. Shielded video cable with 15-pin connectors (supplied with each Monitor 100).

NOTE: The Apple III, Apple III Plus, and the Apple Extended 80-Column Text/AppleColor Card for the Apple IIe are all supplied with a color demonstration disk.

Applesoft Tutorial: Display problems on the Apple IIc

Revised: 10/8/84
Security: Everyone

Applesoft Tutorial: Display problems on the Apple IIc

=====
Customers are finding that some of the programs on the Applesoft Sampler diskette (included with the Applesoft Tutorial), when used on an Apple IIc, do not function as expected. Menus generated by these programs operate correctly when used on an Apple IIe, but there is a vertical displacement of one line between menu selection numbers and menu item descriptions when executed on an Apple IIc.

The problem resides in three programs (CONVERTER, MAGIC.MENU and DISK.MENU) located on the Applesoft Sampler diskette. Load the "CONVERTER" program and list line number 625. This line should currently read;

```
625 VTAB PEEK(37): IF COL80 THEN VTAB PEEK(1531)
```

Change this line to read:

```
625 IF COL80 THEN VTAB PEEK(1531) : GOTO 630
```

and then add the following line:

```
627 VTAB PEEK(37)
```

SAVE the file "CONVERTER".

Make the same changes to the files "DISK.MENU" and "MAGIC.MENU"

These changes will fix the problem.

We have been informed that these changes will soon be included in final product. However, the problem exists in product that is already shipping, so you can and should expect to hear from customers about this. Our suggestion is to perform the above changes to the CONVERTER MAGIC.MENU and DISK.MENU programs and give the fixed version of the program to those customers that need it. We expect to be informed when the change takes place in final (shipped) product.

As an added attraction we have found that two programs mentioned in the

manual are noyt included on the disk. The listings for MOUSE.MOVE and MOUSE.DRAW follow. Please distribute them to customers who did not recieve copies on their disks.

MOUSE.MOVE

```
10 HOME
20 PRINT "THIS IS A DEMONSTRATION OF THE MOUSE"
30 PRINT CHR$(4);"PR#4": PRINT CHR$(1)
40 PRINT CHR$(4);"PR#0

Macintosh System Software 6.0.2: Labeled Incorrectly As 6.0.1

Revised: 5/31/89
Security: Everyone

Macintosh System Software 6.0.2: Labeled Incorrectly As 6.0.1

=====

This article last reviewed: 17 October 1988

Since the end of September 1988, the Macintosh has been shipping with system software 6.0.2 labelled as version 6.0.1. These incorrectly labelled floppy disks are accompanied by an errata sheet to alert users of the discrepancy. Apple apologizes for the confusion, but a label change at this late date would have caused an excessive delay in shipping out the latest system software.

In summary, system software 6.0.1 was not and is not being shipped to customers, regardless of what appears on any labels.

Carriage Returns and Linefeeds in AppleSoft

Revised: 10/8/84
Security: Everyone

Carriage Returns and Linefeeds in AppleSoft

=====

After the printer comes to the end of a line and before it prints the next line of text, it takes care of two signals, the carriage return and the line feed. The carriage return, ASCII CR (decimal 13), signals the printer to send the print head to home position if necessary. The line feed, ASCII LF (decimal 10), signals the printer to feed the paper past the print head by one line space.

Most printers, printer interface cards, and application software programs offer options in ignoring or accepting these printer signals. These options help when printed output has too many or too few line spaces to your liking. With the following procedure, you select the options which produce the proper printing format.

1. Determine how many line feeds you want to add or subtract.
2. Turn off, then turn on the printer. Print a Basic program. If the program lists line after line then go to step 4.
3. Check the printer manual and/or the interface card manual for instructions on changing the linefeed option on each device. Change one of the devices to add or subtract the number of linefeeds you determined.
4. Print from your application software package(s). If the output is still not to your liking, check the application program's manual for instructions on changing the linefeed option in the program.

Passing strings to and from functions in Pascal III

Revised: 10/8/84
Security: Everyone

Passing strings to and from functions in Pascal III

=====

Functions cannot return a string per se because functions cannot return a non-scalar variable, such as a string. Functions can however return the address of a string with the VARIABLE (VAR) parameter. The pass-by-reference VAR parameter can pass the address of a string to and from functions and assembly language routines.

In contrast, when a value parameter is used, the value of the parameter is passed (See pp.87-90, Apple III Pascal Programmer's Manual, Volume 1). Listed below is an example of passing a string to and from a function. A procedure could have been used similarly since parameter-passing rules are the same for procedures as for functions. The value returned by the function is also used to check the success of the function. This check is a good programming convention for functions.

```
PROGRAM PASS;
```

```
VAR I: INTEGER;
```

```
ST1: STRING;
```

```
TABLE: ARRAY [0..50] OF STRING (* For this program to run, *)  
                                (* TABLE must be initialized*)  
                                (* prior to calling DOIT.  *)
```

```
FUNCTION DOIT (VAR ST2: STRING; INDEX: INTEGER):BOOLEAN;  
    (* VAR designates ST2 as a VARIABLE parameter.*)
```

```
BEGIN
```

```
    DOIT := TRUE;
```

```
    IF LENGTH(TABLE [INDEX]) = 0 THEN (*DOIT returns false if *)  
        DOIT := FALSE                (*the given entry(INDEX)*)
```

```
    ELSE ST2 := TABLE [INDEX]        (*in the table is null. *)
```

```
END;                                (*ELSE, IT RETURNS TRUE.*)
```

```
BEGIN
```

```
    FOR I := 0 TO 50 DO
```

```
        BEGIN                                (* ST1 should be null unless *)
```

```
            ST1:= '';                        (* DOIT alters it.                *)
```

```
            IF DOIT(ST1,I) THEN              (* If the array entry is not *)
```

```
        WRITELN(ST1)                (* null, print the string.  *)  
    END;  (* FOR *)  
END.
```

Notes.

1. An individual element of a packed variable cannot be supplied as the actual parameter. See page 90 of the Apple III Pascal Programmer's Manual, Volume 1.

2. The addresses of strings are ALWAYS passed to the procedure or function, whether the string is a VARIABLE parameter or a value parameter. Declaring the string parameter to be a VARIABLE parameter avoids coping the entire value of the string to the function and attendant lowering of memory and performance. Bear in mind that, it is generally good programming technique to use value parameters wherever possible for maximum "decoupling" of function and calling program.

Apple Writer: Keeping a printout's first line at the page's top

=====

If the Page Interval (PI) option of Apple Writer's Print/Program Commands doesn't reflect the exact number of lines long your paper is, the first line of each page will be printed either slightly higher or slightly lower than the first line of the previous page; if the document is long enough, the text may actually begin to spill over the page boundary. To correct the problem, raise the value of PI if the first line printed is creeping upwards; lower it if the first line is creeping downwards.

AppleWorks 2.0: Memory Management on the Apple IIGS

Revised: 9/1/87
Security: Everyone

AppleWorks 2.0: Memory Management on the Apple IIGS

=====

This article last reviewed: 9/1/87

After recognizing that it is running on an Apple IIGS, AppleWorks 2.0 uses the built-in memory manager to allocate all memory use. If the Apple IIGS is cold started, several of the tools in ROM are initialized and given small portions of memory for their own use. These tools include the Tool Locator, Memory Manager, and Desktop Manager. Also, the RAMDisk is defined, either as the number specified as the 'Minimum RAMDisk size' or 10K, whichever is larger.

When AppleWorks runs, it starts by allocating most of the first 64K bank and portions of the second 64K for itself. The rest of the memory remains free, available for expansion by the AppleWorks desktop and the RAMDisk.

Therefore, the amount stated by AppleWorks as 'nK free' is the sum of:

- the memory not allocated by the memory manager
- plus the memory already owned by AppleWorks
- less the memory owned by AppleWorks but occupied by documents currently on the desktop.

As AppleWorks runs, this nK of free space gets consumed either by AppleWorks, by the RAMDisk, or by add-on accessory programs.

AppleWorks allocates memory to:

- files that appear on the desktop
- portions, or all, of the AppleWorks program
- free space

As in all earlier versions, AppleWorks removes portions of itself from its portion of RAM if the memory is needed to store data files.

ProDOS: Displaying LoRes Graphics in a Startup Program

=====

This article last reviewed: 11 May 1987

With DOS, it is possible to create a graphics picture in LoRes that can be displayed as part of the startup program. To do this, first save the picture to disk (using BSAVE 'filename',A1024,L1024), then (under program control, and after the LoRes screen has been turned on with the GR command) load the picture using BLOAD 'filename'.

With ProDOS, however, the area allocated for LoRes screen memory is protected, so the above procedure used for DOS will not work with ProDOS. To get around this, undo the protection byte, load the screen the reset the protection byte back to the original value. Below is a short program that will allow the ProDOS user to BLOAD a previously saved LoRes screen.

```
10 A= PEEK (48984)
20 POKE 48984,0
30 GR
40 PRINT CHR$(4);"BLOAD FILENAME"
50 POKE 48984,A
60 END
```

High Speed Serial Interface Card: Initializing with POKEs 11/96

Revised: 11/19/96
Security: Everyone

High Speed Serial Interface Card: Initializing with POKEs 11/96

=====

Article Created: 21 September 84
Article Reviewed/Updated: 18 November 1996

TOPIC -----

This article discusses how to use POKEs instead of PR# or IN# commands to initialize the High Speed Serial Interface. This information applies to the Apple II, II+, and IIfx computers.

DISCUSSION -----

Neither the PR# nor IN# commands in Applesoft and Integer Basic initialize the High Speed Serial Interface. This situation can cause problems for you if you need to modify the parameters of the interface for your application.

What happens is that the ROM on the High Speed Serial Interface card, upon receiving the first character, sets all parameters to their default settings; so, after you've POKEd the parameter you want, the first character you send will cause the ROM to overwrite all the parameter locations you just set up.

The remedy is to send a character through the card and then change the parameter locations by means of the following POKEs. Please refer to the High Speed Serial Interface Card manual for additional information about what each POKE does.

Replace all occurrences of "s" below with the number of the slot that the High Speed Serial Interface Card is plugged into.

10 POKE 1144+s,64	BRATE, page 21
20 POKE 1272+s,2	STBITS, page 21
30 POKE 1400+s,7	STATUS, page 22
40 POKE 1528+s,0	Character counter
50 POKE 1784+s,80	PWDTH, page 23
60 POKE 1912+s,9	NBITS, page 23
70 POKE 2040+s,129	FLAGS, page 24

To benefit from these POKEs, you will need to use the additional list of POKEs

below; these POKEs replace the PR# and IN# commands. Use CALL 1002 if you will be doing DOS commands while the interface is enabled. Since DOS does slow down I/O, you can opt to delay using the CALL 1002 until after the data transfer has been made if you need maximum I/O speed..

These POKEs must all be on one command line separated by colons to work in command mode:

```
POKE 54,5: POKE 55,192+s: POKE 65,7: POKE 57,192+s: CALL 1002
```

They can have separate line numbers in a program:

```
80 POKE 54,5           PR#s
90 POKE 55,192+s
100 POKE 65,7          IN#s
110 POKE 57,192+s
120 CALL 1002
```

The normal way to reset the I/O to the Apple video and keyboard is:

```
900 D$ = CHR$(4): REM CTRL-D
910 PRINT D$; "PR#0"
920 PRINT D$; "IN#0"
```

However, this will only work after a PRINT and will be ignored after a GET or PRINT terminated with a comma or semicolon. To avoid having to do an extra PRINT you can use:

```
900 CALL -375 : REM THIS IS IN#0
910 CALL -365 : REM THIS IS PR#0
920 CALL 1002 : REM THIS RECONNECTS DOS
```

Video Echo

Do not allow echoing to video while printing. Your program or variables will suffer if video output is not disabled while printing lines more than 40 characters long. Refer to the High Speed Serial Interface Card manual, which came with your card, for additional information on disabling video echo.

Pascal II: Using Library Name Files

Revised: 5/11/87
Security: Everyone

Pascal II: Using Library Name Files

=====

Many people have trouble using Library Name Files in Apple II Pascal (v.1.2 and 1.3). Here is a short explanation on what library name files are, and how they are used in Pascal.

Library Name files, which contain the names of libraries to be used when running a program, are designed for very large applications, or for multiple program applications that need to use the same libraries.

With small applications, when you want to use a library other than the system library, you can link your libraries (as regular units) directly into your program. For larger applications, however, this is impracticable, since each re-compilation makes linking more difficult and cumbersome. The solution for larger applications is to create Program Libraries which allow you to build your own set of intrinsic units without having to place them in the system library. (Intrinsic units have the same root name as the program, but have the suffix '.LIB' on the end; e.g., a program named TRYIT.CODE becomes TRYIT.LIB). What Library Name files do is allow you to handle up to five Program Library files for each program.

To use Library Name files, write your library code and program code in the standard way. Each library unit MUST be an intrinsic unit. When writing your program you must remember to use the "\$U ..." option to tell the compiler where to find your libraries interface (program library names are used only at execution time.). After compiling your library units, don't forget to use the LIBRARY program to place a library header in the file. Now, just compile your program and create your library name file. When you execute, your program will find its units even though you did not have to link them in.

Here are three sample files that illustrate the process:

Main program source code [TRYIT.TEXT]:

```
PROGRAM USEWALLY;
```

```
USES      {$U WALLY.LIB} WALLY;
```

```
BEGIN
```

```
    DOWALLY;
```

```
END.
```

Wally, library unit source code [WALLY.TEXT]:

```
UNIT WALLY;
```

```
INTRINSIC CODE 17 DATA 18
```

```
INTERFACE
```

```
VAR      WALLSTR:STRING[80];
```

```
PROCEDURE DOWALLY;
```

```
IMPLEMENTATION
```

```
PROCEDURE DOWALLY;
```

```
BEGIN
```

```
    WRITELN('WELL WALLY WORKS WELL I THINK');
```

```
END;
```

```
BEGIN
```

```
END.
```

Library name file [TRYIT.LIB]:

```
LIBRARY FILES:
```

```
WALLY.LIB
```

```
$$
```

To build this program, you must compile the library unit first, then use LIBRARY to turn it into a library (with the proper header). Finally,

compile the main program (TRYIT.TEXT) and then run it to be sure that it works.

AppleShare: Documentation Error About Server's RAM Cache Setting

Revised: 10/4/89
Security: Everyone

AppleShare: Documentation Error About Server's RAM Cache Setting

=====

This article last reviewed: 11 May 1987

In the AppleShare Administrator's Guide (copyright 1987, Chapter 1, page 16) there is the statement: "You must also check the RAM Cache. Then when you start up the server, frequently used info will be stored in the cache. This can improve the server's performance."

It goes on to state that you should set this only to the current recommended amount of 64K, and that this amount may increase in future releases of AppleShare.

This documentation is incorrect. AppleShare on the Server ignores the Control Panel RAM cache setting. AppleShare automatically allocates RAM for the foreground application, the stack, and itself, then turns all the rest of available memory into RAM cache. This correction will be documented in AppleShare 1.1 with a release note.

High Speed Serial Interface Card: Settings (11/96)

Revised: 11/19/96
Security: Everyone

High Speed Serial Interface Card: Settings (11/96)

Article Created: 21 September 84
Article Reviewed/Updated: 19 November 1996

TOPIC -----

The Apple II Serial Interface Card (A2B0008), also known as the High Speed Serial Interface Card, is primarily used with serial letter-quality printers like the Qume, Diablo, and NEC Spinwriter series.

The following explains the functions of the various DIP switches and PROMs on the High Speed Serial Interface Card. This card has been discontinued and is no longer available from Apple.

DISCUSSION -----

Baud Rate - Switches 1,2 and 3

DIP Switch			Baud Rate
1	2	3	
ON	ON	ON	110
OFF	ON	ON	134.5
ON	OFF	ON	300
OFF	OFF	ON	1200
ON	ON	OFF	2400
OFF	ON	OFF	4800
ON	OFF	OFF	9600
OFF	OFF	OFF	19200

The settings of DIP switch levers 1, 2, and 3 determine the rate at which bits may be transmitted to the external device: 300 baud is 300 bits per second.

Carriage Return Delay - Switch 4

DIP Switch	Carriage Return Delay
4	
ON	Enabled
OFF	Disabled

If switch 4 is Off (Delay Enabled), the Serial Interface waits briefly (approximately 1/4 second) after transmitting a carriage return before resuming transmission of further characters, allowing the printer's carriage to return. If you are transmitting to an external TV screen, this delay is probably unnecessary, so lever 4 may be turned On (Delay Disabled).

Line Width plus Apple Video - Switches 5 and 6

DIP Switch	Line Width (characters	Apple Video
5 6	per Line)	
ON ON	40	Enabled
OFF ON	72	Disabled
ON OFF	80	Disabled
OFF OFF	132	Disabled

After a carriage return, the settings of switches 5 and 6 determine the maximum number of characters that can be transmitted before the Serial Interface forces another carriage return to be sent. Characters are displayed on the screen only if line width is set to 40 characters per line (levers 5 and 6 On). After initialization, the line width can be changed from 40 characters per line, but the display on the screen will not correspond to the display on the external device, since transmitted carriage returns are not accompanied on the screen by line feeds.

Line Feed - Switch 7

DIP Switch	Line Feed
7	
ON	Disabled
OFF	Enabled

If switch 7 is Off (Line Feed Enabled), the Serial Interface transmits a line feed after each carriage return. If the external device automatically supplies its own line feed after each carriage return received, you can set lever seven to On (Line Feed Disabled) to avoid unwanted double-spacing.

Important Information

=====

Permanent Defaults

During each initialization, five remaining operating parameters are set to permanent default values:

1. Parity defaults to disabled (no parity bit).
2. Checksum defaults to disabled (no checksum character).
3. Lower-Case defaults to disabled (converts all incoming lower-case characters to upper-case).
4. Number of Data Bits defaults to 9 (8 data bits plus one start bit).
5. Number of Stop Bits defaults to 2.

After initialization, these five parameters can only be changed by software commands.

Hardware Handshaking Flow Control

This card does not have any hardware handshaking flow control. It can therefore only be used at slow baud rates. Additional information on flow control can be found in the Tech Info Library article titled "Flow Control Protocols (XOn/XOff or DTR)".

P7-04 PROM

Early versions of the High Speed Serial Card would not work with certain cards in the next higher numbered peripheral slot. The P7-04 PROM solves this problem.

P8A PROM

After a program sends output to a printer, and before the P8A PROM allows the Apple to continue executing the program, the P8A sends an ASCII ETX (CTRL-C) to the printer at the end of each line and waits for the printer to send back an ASCII ACK (CTRL-F). So the P8A can send the ASCII ETX, make sure pins 2 & 3 on the interface connector are connected straight across; also make sure the printer can send the ACK. If the pins and the printer do not meet these conditions, then the computer stops running the program after the first line sent to the printer. Neither the original PROM, called the P8 (Apple part# 341-0018), or the basic card provided handshaking capabilities.

The PROM P8A should be installed in place of the existing PROM P8 when using Qume compatible printers. Be aware that switch 4 has a different function with this setup and must be in the OFF position.

The P8A prom uses location \$3C as a temporary memory register. Many of the monitor commands cannot be used with any printer because of this conflict.

PROM 8A Printer Support

Printers that support the P8A are:

Anderson Jacobson 832 (send <ESC>!W to set the AJ's mode, page 3-30)

Qume Sprint 5

NEC Spinwriter

DB-25 Connector Pinout

DB-25 Connector	Signal Name
-----------------	-------------

2.....	Receive Data (Rx)
3.....	Transmit Data (Tx)
7.....	Signal Ground
12.....	Current Loop Data In (Return)
13.....	Current Loop Data In
23.....	Current Loop Data Out

Current Loop

The High Speed Serial Interface has a 20ma current loop. It has an active send loop and a passive receive loop.

Page 8 of the card's manual tells how to connect to an 33ASR teletype. This may not work with other 20ma devices. It assumes that the device has a passive send and receive loop.

If the other device has its own active send loop then connect it as follows:

Connect pin 23 to Printer +
Connect pin 7 to Printer -
Connect pin 12 to Keyboard +
Connect pin 13 to Keyboard -

Applesoft BASIC: Right-justifying columns of numbers

=====

Many users want their Applesoft BASIC codes to print a right-justified column of numerals with the same number of decimal places, usually two. Beginning at line 1000, the subroutine in this sample program formats the numerals of the string variable X\$ before line 140 prints it. To specify the format, line 1020 assigns a decimal value to the numeric variable F. The value 8.2 specifies a format of 2 decimal places and 8 total characters (digits, decimal point, sign, and leading spaces). The subroutine rounds the number in X to the desired number of decimal places indicated by the number to the right of the decimal point in F. Then the subroutine pads X\$ with spaces until the string is the length indicated by the number to the left of the decimal point.

```
100 HOME: PRINT "NORMAL", "FORMATTED"
110 FOR I = 1 TO 5
120 READ X: PRINT X,
130 GOSUB 1000
140 PRINT X$
150 NEXT I
200 DATA 1, -3, .2, 17, 450
300 END
1000 REM PRINT FORMATTING
1010 REM
1020 F = 8.2: REM FORMAT CONTROL
1030 TC = INT (F): REM TOTAL CHARACTERS
1040 DP = VAL ( RIGHT$ ( STR$ (F), 1)): REM DECIMAL PLACES

AppleColor Monitor 100: Making it compatible with the Apple IIGS

=====

This article last reviewed: 9 November 1988

According to the Apple II Compatibility Guide (P/N A2F2204), the AppleColor Monitor 100 is not compatible with the Apple IIGS. For the many owners of the AppleColor Monitor 100 who are upgrading their IIe's to the Apple IIGS, but who want to avoid having to purchase a new monitor, there is a workaround.

Inside the AppleColor Monitor 100 on the main PC board, almost directly under the neck of the CRT, there is a slide switch labeled "16 color/8 color". To make the AppleColor Monitor 100 work with the Apple IIGS, set the switch to the 8 color position, and use the cable provided with the Color Monitor 100 (svc part # 590-0194-A) to connect it to the the Apple IIGS. This configuration makes all colors available.

Apple Computer, Inc. takes no responsibility for any damages incurred, real or implied, that may result from this change.

Printing DOS Text Files

Revised: 4/2/91
Security: Everyone

Printing DOS Text Files

=====

DOS text files do not transfer directly to a printer. Use this program to print text files to any slot desired by the user. The program does not strip leading spaces or limit strings to 239 characters.

```
100 TEXT: NORMAL: HOME
110 D$ = CHR$(4)
120 KB = -16384: KS = -16368
130 INPUT "TEXT FILE NAME? ";FILE$
140 PRINT
150 INPUT "DESTINATION SLOT? ";S : REM PRINTER SLOT NUMBER
160 ON ERR GOTO 500
170 PRINT D$;"OPEN ";FILE$
180 PRINT D$;"READ ";FILE$
190 GET A$
200 PRINT D$;"PR#";S
210 PRINT A$
220 IF (PEEK (KB) <> 155) GOTO 190
230 POKE KS,0
500 PRINT D$;"PR#0"
510 PRINT
520 PRINT D$;"CLOSE ";FILE$
540 END
```

Keying ESCAPE stops the program before it reaches the end of the file.

Dow Jones News & Quotes Reporter: Specifications

Revised: 7/30/92
Security: Everyone

Dow Jones News & Quotes Reporter: Specifications

=====

Order #: A2D0030

--Technical Specifications

- Format: 16-sector disks.
- Language: Written in Pascal.
- Dow Jones Access: Minimum 15-minute tape delay; exchanges include NYSE, AMEX, Midwest, Pacific, Composite, and OTC NASDAQ.
- Dow Jones Toll-Free Information: (800) 257-5114; in New Jersey, call (609) 452-1511.

--Package

1. Dow Jones News & Quotes Reporter master disk;
2. Dow Jones News & Quotes Reporter backup disk;
3. instruction manual;
4. Dow Jones News/Retrieval operating guide and symbol directory.
5. Dow Jones News/Retrieval contract and password information sheet.
6. One free hour of connect time, to be used during nonprime-time hours, within 30 days of the date of purchase of the Dow Jones News & Quotes Reporter package.

--System Configuration

1. Apple II or Apple II Plus, with a minimum of 48K of memory, or Apple IIe
2. disk drive, such as Apple Disk II
3. video display device, such as Monitor II
4. a recommended modem, either a D.C. Hayes MicroModem or a Novation Apple Cat modem
NOTE: The Apple modems, in conjunction with the Super Serial Card, will not support the Auto-dial necessary for the Auto-Log-on feature of the Dow Jones Reporter. One of the recommended modems must be used for this feature.

5. standard working telephone;
6. printer with appropriate interface card (optional).

NOTE: This product is no longer supported by Apple Computer, Inc.

Apple IIe Keyboard: Defeating The Keyboard Auto Repeat

Revised: 7/15/91
Security: Everyone

Apple IIe Keyboard: Defeating The Keyboard Auto Repeat

=====

Article Created: 21 September 1984
Article Last Reviewed: 23 April 1991
Article Last Updated: 25 May 1989

Disabled persons want to know how to defeat the repeat function of the Apple IIe keyboard so that it's easier to use. The following procedure defeats the repeat function without changing the keyboard in any other way.

Exercise caution. The following procedure may void the warranty on the Apple IIe.

- 1) Remove the main logic board from the case.
- 2) Locate the large IC just below the keyboard connector, location D14.
- 3) Carefully remove the IC.
- 4) Locate the small dot or indentation on the corner of the IC and from there count up to pin 5.
- 5) Carefully bend pin 5 out from the IC.
- 6) Carefully reinsert the IC into the logic board. Make sure that pin 5 is the only pin not inserted and that no other pins are bent.
- 7) Reinstall the logic board into the case.

Try the repeat function. It should not operate.

Apple IIc Serial Port: 8-bit vs. 7-bit data format

Revised: 10/8/84
Security: Everyone

Apple IIc Serial Port: 8-bit vs. 7-bit data format

=====

The setting of the data format for the Communications Port defaults to an 8-bit rather than a 7-bit data format. While many telecommunications systems use 8-bit, most of the popular information systems such as Dow Jones and the Source use 7-bit. Attempts to communicate with 7-bit systems lead to garbled information when the default goes unchanged. A command to the software changes the data format on some terminal packages, but others may not allow this command, rendering them useless. Of all the modems tested, only the Apple modems don't care about 8- or 7-bit data format settings.

AppleWorks 1.2 and 1.3: Specifications (Discontinued)

=====

Order #: A2D4501

--Technical Specifications

--Maximum number of files on the desktop: 12

--Word Processor: reads and writes ASCII and AppleWorks format files

--Data Base:

--Memory-based design

--Maximum number of categories: 30

--Maximum number of categories that can be calculated from other categories: 3

--Reads and writes:

1. ASCII files

2. Data Interchange Format (DIF) files

--Reads Quick File II files

--Spreadsheet:

--Maximum number of columns: 127

--Maximum number of rows: 999

--Reads and writes Data Interchange Format (DIF) files

--Reads VisiCalc files

--Package

1. Disk: AppleWorks Startup and Program

2. Disk Apple Presents AppleWorks, Sides I and II

3. Disk: AppleWorks Sample Files

4. Manual: AppleWorks Tutorial

5. Manual: AppleWorks Reference

6. Card: AppleWorks Quick Reference Card

7. Disk 3.5 version

--System Configuration

..TIL00270-AppleWorks_1-2_and_1-3-Specifications_Discontinued.pdf

1. Apple IIe or IIc personal computers
2. Monitor II
3. Disk II
4. Apple 80-Column Card
5. Extended 80-Column Card containing an additional 64K memory (recommended)
6. A compatible printer, such as Imagewriter or Dot Matrix Printer (recommended)

--Features

Word Processor

- Provides: boldface, super--and subscripts, proportional spacing, and a selection of character and line spacings.
- Includes: search and replace, page headers and footers, automatic page numbering, and full move and copy capability.

Data Base

- Produces tables and mailing labels with built-in report generator

NOTE: AppleWorks will only print a single column of labels, not 2 labels across. (Use HabaMerge to print a sheet of 2 columns of labels.)

Spreadsheet

- Allows: Fully adjustable decimal points, dollar and percent signs, individually variable column widths, and cell protection.
- Includes: Net present value, choose, and lookup.
- Arranges worksheet rows either alphabetically or numerically.

--AppleWorks version 1.2:

1. Adds the Scribe Printer to the options in the "Add a Printer" option menu. All the Scribe's features are now usable.
2. Gives you the ability to customize AppleWorks to work with non-Apple interface cards. Follow the card manufacturer's instructions.

NOTE: In Fall of 1984, an AppleWorks Interface Card Configuration Utility became available. It still can be downloaded from the "Apple Cares" Regional Bulletin Board under the topic "AppleWorks".

CAUTION should be taken with this utility because it only works with versions 1.0 and 1.1 and will destroy a 1.2 disk.

Customers will, in general, find it easier to take their original AppleWorks 1.0 or 1.1 diskettes to their dealer to get version 1.2 copied.

3. Fixes parallel interface card problems with respect to correctly sending control characters from an Apple IIe.

--AppleWorks version 1.3:

1. Supports memory expansion card
2. Supports Uni 3.5

Macintosh: Honeywell Bull DPS6 Terminal Emulator

=====

Article Created: 11 May 1987
Article Reviewed/Updated: 27 July 1993

There is a product, called the PC7800, that enables a Macintosh to emulate a Honeywell VIP7801/7814 so it can interface with a Honeywell Bull DPS6 computer.

PC7800 may be ordered in the U.S.A. from Bull HN Information Systems (formerly Bull HN), (800) 343-6665. To order the product for delivery in Europe, contact either Rob Anderson in the U.K. at 44 81 894 5577 or Daniel Pepin in Paris, France at 33 13 902 4211. To locate a vendor's address and phone numbers, use vendor name as a search string.

Article Change History:
26 July 1993 - Company title updated from Bull HN to Bull HN Information Systems.

Apple II: Digitizers

Revised: 2/11/93
Security: Everyone

Apple II: Digitizers

=====

Article Created: 21 September 1984

Article Change History

02/09/93 - UPDATED
Micron Technology acquired by Xceed Technologies.
09/21/84 - REVIEWED
• For accuracy.

Here are a few digitizers for the Apple II:

Computereyes	by	Digital Vision, Inc. 14 Oak St. #2 Needham, MA 02192 (617) 444-9040
Dithertizer II	by	Computer Station 11610 Page Service Drive Saint Louis, Mo 63146 (314) 432-7019
Digisector	by	Micro-Works P.O. Box 1110 Del Mar, CA 92014 (619) 942-2400
Micro D-Cam	by	Micro Mint 561 Willow Ave. Cedarhurst, NY 11516 (516) 374-6793
Micron-Eye	by	Micron Technology (acquired by Xceed Technologies) Xceed Technologies 37560 31 Mile Rd.

Richmond, MI 48062
313-727-4085
800-642-7661

The Dithertizer and the Digisector accept input from a standard video camera. The Micro D-Cam and Micron-Eye use a solid state camera made from a special purpose imaging chip. All have software to map the output from the camera to the High-Res Screen of the Apple II.

The Dithertizer uses a feature called contouring. This makes the processor display only those portions of an image which fall in a certain brightness (or darkness) range. With this method you could set the digitizer to display only the darkest spots on the screen. Then you could write software to scan the digitized image for spots, count them and note their position.

Micron-Technology (acquired by Xceed Technologies) makes an RS-232 version of the Micron-Eye. With the proper software, this could be your digitizer for Macintosh, Lisa or Apple III.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

Business BASIC III Reference Manual Errata: VAL function

Revised: 10/8/84
Security: Everyone

Business BASIC III Reference Manual Errata: VAL function

=====

Volume 1, page 58 in Chapter 2, Tools of Your Trade:

String Functions: The VAL Function

The ?TYPE MISMATCH ERROR listed for the VAL function does not occur; instead:

1. If the string begins with a non-numeric (except leading spaces) the value returned is 0.
2. If the string begins with a number but contains non-numeric characters then the value returned is the value of the beginning number.

The VAL of a null string is UNDEFINED! Because of the hard coding, Applesoft returns 0. But the RAM-based Business Basic returns whatever value happens to be in RAM memory at the time.

DOS 3.3 6502 editor assembler: PR slot command

Revised: 10/8/84
Security: Everyone

DOS 3.3 6502 editor assembler: PR slot command

=====

There is a .PR# slot# command in the DOS 3.3 6502 editor assembler of the DOS tool kit. If you use this command you get not a file listing, but a dump of the buffer that starts with data entered by the user or LOAded from a text file. After this part of the buffer has been printed, the dump continues with the garbage in the buffer beyond the last intelligible character to the end of the allowable buffer. This produces numerous @ signs or other characters depending on the contents of buffer memory after power-up and is a normal part of a Print or List of the assembly program to a printer using .PR# slot# from the editor.

Try it yourself.

1. Boot the DOS 3.3 6502 editor/assembler
2. LOAD a large source code file
3. List it to see what it looks like
4. Type NEW to clear the buffer
5. LOAD a smaller source code file
6. Type .PR#1 to send the DOS command to activate the printer
7. Type L to list the buffer to the printer

Notice that the last part of the first file follows the last line of the second file. Also notice that such a listing does not match the screen output when using the List or Print commands but instead follows the input format.

To obtain a listing with the same format as displayed on the screen using Print or List commands you must append ',@' to the ASM command. This assembles the file without generating an OBJect code file (see page 56 of the editor/assembler manual). To speed this process when using an Imagewriter and Super Serial Card on an Apple II+ or Apple IIe, do the following.

1. Set the Imagewriter print style to ultracondensed (17cpi)
2. Set the baud rate of printer and card to 9600
3. Send the output of the assembly to the printer using PR#

Notice that there is no period (.) preceeding the PR# command in this case. This is because you are not using the DOS command version but rather the

editor/assembler PR# command. See the editor/assembler manual for the format of the PR# command on page 60 and a discussion on pages 60 and 61.

With an Imagewriter at 9600 baud, the above three steps reduce the listing time by 41% when comparing the default type style to the ultracondensed style.

Pascal: STRING characters

Revised: 10/8/84
Security: Everyone

Pascal: STRING characters

=====

Use the routine below to create a STRING containing the CHARacters you wish to add to the STRING, then use the Pascal CONCAT to put them together.

```
PROGRAM CONCAT_CHAR;

CONST LEN = 4;                { or whatever you want }

VAR TEST_STRING : STRING;
    CH : CHAR;
    I : INTEGER;

(*$R-*)      { turn Range Checking off so you can    }
              { alter individual cells of the string }

BEGIN
    TEST_STRING[0] := CHR(LEN); { set length of string }
    FOR I := 1 TO LEN DO
        BEGIN
            READ (CH);
            TEST_STRING[I] := CH;
        END;
    WRITELN;
    WRITELN (TEST_STRING);
END.
```

Make sure that if this is done within a PROCEDURE or FUNCTION, and the STRING is passed as a parameter, that the (*\$V-*) option is used as well as declaring a TYPE to pass rather than STRING:

```
TYPE STR_TO_PASS = STRING;

PROCEDURE WHATEVER (ST : STR_TO_PASS);
BEGIN
END;
```

Parallel Interface Card: Jumper Block Modification (11/96)

Revised: 11/20/96
Security: Everyone

Parallel Interface Card: Jumper Block Modification (11/96)

=====

Article Created: 21 September 1984
Article Reviewed/Updated: 19 November 1996

TOPIC -----

This article details how to modify the Parallel Printer Interface card to work with different parallel printers. Refer to the card manual for more information on these modification.

DISCUSSION -----

There are two features that can be modified on the Parallel Card, the wiring of the jumper block and the PROM at location "Prom P1"

Jumper Block

The wiring of the jumper block controls the correct polarity of the strobe and acknowledge signals. Here is an example of the wiring for a "Centronics-type" printer.

Block	
4 -----16	negative strobe, negative acknowledge
6 -----14 AND 15	
7 -----10	
11 -----12 AND 13	

Notch on jumper block denotes pin 1, the count CCW

PROM 1

The location marked "Prom P1" on the card will work with two different PROMs which produce different results when installed. To change the results, just remove one PROM and install the other.

NAME	APPLE PART #	RESULTS
P1 PROM	341-0005	Automatically initializes printer to 80 column. No carriage return generated after every linefeed.
P9 PROM	341-0019	No auto initialization to 80 column mode. Generates a carriage return after every linefeed.

LocalTalk PC Card: A Description (Discontinued May 1991)

Revised: 3/10/94
Security: Everyone

LocalTalk PC Card: A Description (Discontinued May 1991)

=====

Article Created: 1 September 1987
Article Reviewed/Updated: 10 March 1994

TOPIC-----

This article describes the discontinued LocalTalk PC Card, now updated and marketed by Farallon Computing, Inc under the product name: PhoneNET PC Card. To obtain Farallon contact information, use "Farallon" as a search string.

DISCUSSION-----

The LocalTalk PC Card lets you to attach MS-DOS computers to the AppleTalkPersonal Network, the fastest-growing personal computer LAN.

You can enhance documents produced with PC-based applications by incorporating fonts, styles, and graphics that were previously unavailable. And you can print documents of near-typeset quality.

The LocalTalk PC Card translates documents into the PostScript page description language, allowing you to access PostScript features for creating your own custom graphics and layouts. The LocalTalk PC Card supports applications such as WordStar, MultiMate, and Lotus 1-2-3; and the PostScript, Diablo 630, and ASCII print file formats.

The LocalTalk PC Card establishes a standard from which developers can create MS-DOS applications for AppleTalk. Two such applications are InBox PC from Think Technologies and EtherSC from Kinetics. InBox PC features electronic mail and file transfer between a Macintosh Plus and an MS-DPS system. EtherSC is an SCSI Ethernet Interface that allows a Macintosh Plus to run AppleTalk over a directly connected Ethernet.

To use the LocalTalk PC Card you need:

- An AppleTalk Personal Network
- One LocalTalk Connector Kit

- An MS-DOS-compatible computer with:
 - a minimum of 256K
 - two double-sided floppy disk drives or one hard disk and one floppy disk drive
 - PC-DOS Version 3.1 or later
- One LaserWriter or LaserWriter Plus printer.

Technical Specifications

AppleTalk Protocol Support

ALAP,DDP,ATP,NBP,ZIP,Echo, PAP RTMP

Interfaces

RS-422 serial prot (230.4 kilobaud data transfer rate); DMA interface to host PC

Drive Interface

Accessed through software interrupt with parameter block

Configuration

Selectable Interrupt Request (IRQ),DMA Request and Acknowledge (DRQ and DACK), and I/O Address; default configuration corresponding to PC COM2 device

Processor

65C02; 1.8 MHz clock speed

Power Consumption (typical)

4 watts at 5 volts DC

Memory

8 kilobytes RAM, 8 kilobytes ROM

AppleTalk communications controller

Zilog 8530 SCC

Accessible Fonts

Courier, Helvetica, and Times Roman (directly from PC LaserWriter Plus fonts (Using PostScript commands)

PostScript Programming Access

PostScript programming additions may be made directly within the text of a file so that programming additions can be made available to all documents

It's not hard to transfer pictures one at a time from one Scrapbook to another if you're careful: the secret is to know when the system is focussing its attention on a particular disk.

The system gets its fonts and desk accessories from the default drive. The default drive is (a) the drive you booted from, or (b) the last drive you ran an applicaiton from. To transfer a picture from one Scrapbook to another, then, simply do the following:

1. Boot up with the disk you want to get the picture from.
2. Open the Scrapbook, copy the picture, and close the Scrapbook.
3. Eject the disk and insert the disk you want to copy to.
4. Run an application on the newly inserted disk.
5. Open the Scrapbook and paste in the new picture.

Step 4 is the one many forget to perform. Even though the Finder is sometimes a little clumsy--asking for the old disk back at surprising times--it's not so bad once you understand that you must run an application to make the system "switch horses."

MacTerminal 2.0, 2.1: Problems with System 4.1 and Finder 5.5

Revised: 9/1/87
Security: Everyone

MacTerminal 2.0, 2.1: Problems with System 4.1 and Finder 5.5

=====

There have been compatibility problems with MacTerminal 2.0 and 2.1 using System File version 4.1 and Finder 5.5. Typical problems include system crashing while trying to print in MacTerminal or crashing when quitting the MacTerminal application. The problem is specific not to hardware but to the combination of MacTerminal version 2.1 and System 4.1. Because of this, problems may occur on any Macintosh running the new system software.

To assure full compatibility with system software and MacTerminal 2.1, MacTerminal 2.1 or earlier versions should use System 4.0 or prior system versions. You may want to continue using System 3.2 included on the Master disk of MacTerminal 2.1. Users of Macintosh 512Ke and Macintosh 512K should continue to use System 3.2 and Finder 5.3.

MacTerminal 2.2 is compatible with the new system software.

Apple guidelines prohibit use of certain low memory locations, and the new system software enforces those guidelines. A system error occurs because MacTerminal, for historical reasons, uses a memory location locked by System 4.1 to prevent the use of reserved memory.

Macintosh: APL terminal emulator

=====

This article last reviewed: 13 May 1987

STSC's APL*PLUS for the Macintosh (formerly sold as PortAPL) has a built-in APL terminal emulator for an APL workstation. In addition to having an APL terminal emulator built-in, APL*PLUS, a comprehensive APL system in its own right, also includes a LaserWriter APL font which can be used for printing documents with APL characters in them.

There is also a version that runs on the Macintosh SE.

For more information, search on "STSC".

Apple IIe: Component diagnostics (1 of 2)

Revised: 7/2/87
Security: Everyone

Apple IIe: Component diagnostics (1 of 2)

=====

Apple IIe computers have built-in diagnostics used during manufacturing. You may invoke the diagnostics by holding down the solid-Apple key while powering the system on, or by unplugging the keyboard and turning the Apple IIe on.

If you depress both the solid and open-Apple keys while powering the system on, the same diagnostics will be run along with a high-pitched tone.

The tone or beep, included in a machine language loop that tests the computers IOU and MMU, merely indicates that the speaker I/O location does indeed work. Because the Apple II performs the IOU/MMU test a random number of times, the beep sounds a random number of times. In addition, the diagnostic routine varies between the Apple IIe, Apple IIe enhanced, and Apple IIC.

The diagnostics test the motherboard's RAM as well as a number of unique LSI components (MMU, IOU, and other ROMs) on the board. If the keyboard is connected, the diagnostic will run through the series of individual tests once. If the keyboard is not connected, the test runs continuously until the system is powered off.

The ICs are tested in the following order: MMU, IOU, E8 ROM, E10 ROM, the eight RAM chips. "Kernel OK" appears on the screen if everything passes the diagnostic.

Note: The diagnostic stops and hangs the processor with the first error detected. There may be subsequent problems in the system; they will go undetected until the first problem is fixed.

Here are some error messages and what they mean:

```
MMU   FLAG E4:0  The Read Lang Card Bank0 switch didn't
                initialize properly during reset.
          1  The Read Lang Card RAM switch didn't
                initialize properly during reset.
          2  The RAMRD switch didn't initialize
                properly during reset.
```

- 3 The RAMWRT switch didn't initialize properly during reset.
- 4 The ALTZP switch didn't initialize properly during reset.
- 5 The C3ROM switch didn't initialize properly during reset.
- 6 The 80STORE switch didn't initialize properly during reset.
- 7 The Read Lang Card Bank0 switch won't change.
- 8 The Read Lang Card RAM switch won't change.
- 9 The RAMRD switch won't change.
- A The RAMWRT switch won't change.
- B The ALTZP switch won't change.
- C The C3ROM switch won't change.
- D The 80STORE switch won't change.

If you receive an MMU FLAG E4 error number, suspect the MMU at location E4.

- IOU FLAG E5:0 The 80VID switch didn't initialize properly during reset.
- 1 The ALTCHAR switch didn't initialize properly during reset.
 - 2 The TEXT switch didn't initialize properly during reset.
 - 3 The PAGE2 switch didn't initialize properly during reset.
 - 4 The MIXMODE switch didn't initialize properly during reset.
 - 5 The HIRES switch didn't initialize properly during reset.
 - 6 The 80VID switch won't change.
 - 7 The ALTCHAR switch won't change.
 - 8 The TEXT switch won't change.
 - 9 The PAGE2 switch won't change.
 - A The MIXMODE switch won't change.
 - B The HIRES switch won't change.

If you receive an IOU FLAG E5 error, suspect the IOU at location E5.

Tech Info Library

Apple IIe: Component diagnostics (2 of 2)

Revised: 7/2/87
Security: Everyone

Apple IIe: Component diagnostics (2 of 2)

=====
ROMs E8 and E10 are tested individually. Since the processor will hang as soon as a failure is detected, and if the failure is in ROM 8, the subsequent test of E10 won't be made. Its possible that if E8 is bad, the diagnostics won't run at all, since they're located in the E8 ROM.

ROM:E8 The ROM at location E8 failed the checksum test.

ROM:E10 The ROM at location E10 failed the checksum test.

The RAM test is a two pass, up and down, write then read test. Any failure is logged and then decoded to provide you with the location of the failed chip.

RAM:F6 A failure detected in the RAM at location F6.
F7 A failure detected in the RAM at location F7.
F8 A failure detected in the RAM at location F8.
F9 A failure detected in the RAM at location F9.
F10 A failure detected in the RAM at location F10.
F11 A failure detected in the RAM at location F11.
F12 A failure detected in the RAM at location F12.
F13 A failure detected in the RAM at location F13.

"KERNEL OK" will appear on the screen when the Apple IIe passes.

HyperCard: Types of Visual Effects

=====

Article Created: 1 September 1987
Article Last Reviewed: 10 July 1992
Article Last Updated: 10 July 1992

Here's a list of HyperCard's varied visual effects which may be used in HyperTalk scripts:

- barn doors open/close
- checkerboard
- iris open/close
- dissolve
- scroll right/left/up/down
- shrink to top/center/bottom
- stretch from top/center/bottom
- venetian blinds
- wipe right/left/up/down
- zoom open/close/in/out

For example, the following script zooms opens the Help stack when you click the Help icon in the Home stack.

```
on mouseUp
    visual effect zoom open
    go to stack "Help"
end mouseUp
```

You can also control a visual's speed: very fast, fast, slow, or very slow.

For example:

```
on mouseUp
    visual effect zoom open very fast
    go to stack "Help"
end mouseUp
```

Article Last Updated: 10 July 1992

HyperCard's Protect Stack feature protects stacks from modification or access. Protect Stack appears in the File menu when your User Preference is set to Painting or higher, and gives a number of options for what level of protection you want.

Beware: if you select Private Access in the dialog box, embed a password in the stack, and then forget the password, you won't be able to decipher the password from HyperCard.

HyperCard: How to Modify Built-In Sound Effects

Revised: 6/24/90
Security: Everyone

HyperCard: How to Modify Built-In Sound Effects

=====

This article last reviewed: 1 September 1987

The two sounds built into HyperCard, boing and harpsichord, can be easily implemented in your HyperTalk scripts.

For example, here's a button script that plays boing when clicked on:

```
on mouseUp
    play "boing"
end mouseUp
```

By default, sounds are played as a quarter note at middle C, but they can be followed by notes (c, d, e, f, g, a, b) and times for each note (w=whole, h=half, q=quarter, e=eighth, s=sixteenth, t=thirty-second; period=dotted). Notes are separated by spaces.

For example:

```
play boing gs gs de ge cw.
```

This line plays boing in two sixteenth-note Gs, an eighth-note D, an eighth G, and a dotted whole C.

HyperCard: Various Search Scripts

Revised: 6/24/90
Security: Everyone

HyperCard: Various Search Scripts

=====

This article last reviewed: 9/1/87

You'll often use HyperCard to search for specific information. The usual way to do this is with the Find command in the message box, but sometimes a button that searches only specific fields is more appropriate.

The standard Find command searches all text fields on all backgrounds of the current stack. If you want searches to include more than one stack, you need to include a stack script in each stack to extend the Find command to search all relevant stacks.

The following button script searches for the selection in stacks "A" and "B":

```
on mouseUp
  set lockScreen to true      - so you don't see the stacks change
  get selection
  go to stack A
  find it
  if the result is empty then
    go to stack B
    find it
    if the result is empty then
      go back
      answer "Sorry, no more information on that topic."
    end if
  end if
  set lockScreen to false
end mouseUp
```

Sometimes, however, you may not want a search to occur because of an explicit Find Command: you'll want a script to search for text in your stacks as a result of an action.

For example, in a phone message stack, when you enter the name of the caller, you want to look up the caller's phone number in the Address stack. Include

the following in the background script:

```
on closeField                                - on Tab or Return key or mouse click
  set lockScreen to true
  get field "Name"                          - from this stack
  go to stack "address"
  find it
  get field "Phone"                        - from Address stack
  go back                                  - to first card of Address stack
  go back                                  - to original card
  put it into field "Phone"                - on the stack
  set lockScreen to false
end closeField
```

If you know what you are searching for, such as a name, you can limit the search to certain fields, using the form:

```
find it in field "Name"
```

HyperCard: Displaying on a large screen

=====

Article Created: 1 September 1987
Article Last Reviewed: 3 June 1992
Article Last Updated: 3 June 1992

TOPIC -----

How do I make my HyperCard window fill my large screen? The window stays at the 9-inch size, the size of the displays on compact Macintoshes. I have tried this using both version 1.X and 2.X of HyperCard.

DISCUSSION -----

Versions of HyperCard previous to 2.0 do not support cards of different sizes, only the size of a compact Macintosh display, 9 inches.

Version 2.X and later does allow custom sizing of HyperCard windows however. But you can't resize a window "on the fly" to fit a large monitor. A card shows up as a window with no grow box or scroll bars and remains the same size as originally defined when the stack was created unless you specifically select "Stack Info..." and resize the window.

You can, however, put the card anywhere on a large screen. You can also make it easier to get to the tear-off tools menu or the message box by putting them outside the window.

Apple IIC: Serial port interfacing (1 of 2)

Revised: 4/27/88
Security: Everyone

Apple IIC: Serial port interfacing (1 of 2)

=====

This article last reviewed: 21 April 1988

The Apple IIC serial ports are 5-pin DIN connectors. Both Port 1 (Printer) and Port 2 (Modem) have the same pin-out and signal description. Here are the cable descriptions for connecting them to the Imagewriter and the Apple Modem.

Apple IIC Serial Port - Imagewriter - Apple Modem

DTR (1)	6 - DSR	6 - DTR
TXD (2)	3 - RCD	9 - TXD
GND (3)	7 - GND	3 - GND
RCD (4)	2 - TXD	5 - RCD
DSR (5)	20 - DTR	2 - DSR

Setting up the printer port from within a program on the IIC is essentially the same as changing the settings on previous interface cards: after first directing output to the serial port (using PR#1 and PR#2 for Ports 1 and 2, respectively), the commands can then be sent to the serial port. Each command for Port 1 must be preceded by CTRL-I. The commands for Port 1 are:

Cmd Description

nnn Set line width(from 001 through 255): This command must be followed by an 'N' or a <CR>.

nnB Set baud rate to value corresponding to nn.

nn	Rate	nn	Rate
01	- 50	09	- 1800
02	- 75	10	- 2400
03	- 110	11	- 3600
04	- 135	12	- 4800
05	- 150	13	- 7200
06	- 300	14	- 9600
07	- 600	15	- 19200
08	- 1200		

nB Set Data Format to values corresponding to n.

n - Format

0	8 data 1 stop
1	7 data 1 stop
2	6 data 1 stop
3	5 data 1 stop
4	8 data 2 stop
5	7 data 2 stop
6	6 data 2 stop
7	5 data 2 stop

I Echo output to screen.

K Disable <LF> after <CR>.

L Generate <LF> after <CR>.

nP Set Parity corresponding to n.

n - Parity

0	none
1	odd
2	none
3	even
4	none
5	mark (1)
6	none
7	space (0)

R Reset Port 1 and exit from serial port 1 firmware.

S Send a 233 millisecond Break character

Z Zap (ignore) further command characters (until CTRL-Reset or PR#1). Do not format output or insert carriage returns into output stream.

Tech Info Library

Apple IIC: Serial port interfacing (2 of 2)

Revised: 9/21/84
Security: Everyone

Apple IIC: Serial port interfacing (2 of 2)

=====

Port 2 uses the same commands, with the differences and additions listed below. Each command for Port 2 must be preceded by a CTRL-A.

nnn	same
nnB	same
nD	same
I	same
K	same
L	same
nP	same
Q	Quit Terminal Mode
R	same
S	same
T	Enter Terminal Mode. Use this command after IN#2 only. If you follow this command by PR#2, the IIC will echo input to output. (NOTE: If the other device is also echoing input to output, entering the first character will cause an infinite loop. Use CTRL-RESET to get out.
Z	same

CTRL-T When issued from a remote device, this command puts the IIC in terminal mode if IN#2 is already in effect. The command is the same as CTRL-T typed locally.

CTRL-R When issued from a remote device, this command undoes the terminal mode command. If IN#2 and PR#2 are in effect, the remote keyboard and display become the input and output devices of the local IIfc. The command is the same as CTRL-A Q typed locally.

Apple IIC: Specifications (1 of 2) (Discontinued 9/88)

=====

--Order #: A2S4000

--Technical Specifications

1. Central Processing Unit (CPU):

--65C02 microprocessor; supports 27 more internal instructions than the 6502

--16-bit address bus; access range: 65,536 (64K) bytes

--8-bit data bus

--8-bit registers:

1. accumulator
2. index register
3. index register
4. stack pointer
5. processor status register

--Clock speed: 1.02 MHz

2. Video:

--Text display modes:

1. 40-column text, 24 lines, 5 x 7 dot matrix (suitable for television or monitor)
2. 80-column text, 24 lines, 5 x 7 dot matrix (80-column card and monitor required)

--Graphics display modes:

1. Low-resolution 16-color graphics:
 - a. 40h x 48v color blocks
 - b. 40h x 40v with four lines of text
2. High-resolution 6-color graphics:
 - a. 280h x 192v dots

- b. 280h x 160v with four lines of text.
- 3. Double high-resolution 16-color graphics:
 - 560h x 192 v dots; extended 80-Column Card required

--All graphics modes may be displayed on a television or monitor

--Color output signal:

- 1. NTSC
- 2. RGB (red, green, blue) with adapter

--Character set:

--Full 128 ASCII characters
96 printable in both upper and lower case
32 graphics characters, called Mousetext

--Display formats:
5 by 7 dot matrix
Normal, inverse, flashing, or Mousetext

3. Memory:

--128K RAM; expandable to 128K with Apple Extended 80-Column Card

--32K ROM, including:

- 1. Applesoft BASIC interpreter
- 2. System monitor routine for machine-language programming
 - a. Disassembler
 - b. Automatic I/O device assignment
 - c. Keyboard and screen-editing features
 - d. Register examine and modify routines
 - e. 80-column-display firmware
 - f. Mini assembler

--The Apple IIC has a total of 39 integrated circuits.

4. Disk Drive:

--Built-in

--For 5 1/4-inch disks:

- 1. Recording surface: 1
- 2. Tracks per surface: 35
- 3. Sectors per track: 16
- 4. Capacity: 140K
- 5. Access:
 - a. ProDOS and Pascal: 137K
 - b. DOS: 124K

5. Inputs/Outputs:

--Typewriter-style keyboard

1. Contoured, full-travel keys for easy touch-typing
2. Generates all 128 ASCII character codes and:
3. Two programmable function keys
 - a. Open Apple
 - b. Solid Apple
4. Four directional arrow (cursor-movement) keys
5. Special-purpose keys
 - Escape, Control, Caps Lock, Delete, Tab, Shift, and Reset
6. Automatic repeat
7. Two-key rollover
8. Configuration:
 - a. Standard
 - b. DVORAK

--Speaker and sound-generation capability

1. Speaker built-in
2. Volume control knob
3. External output jack with switch

Apple IIc: Specifications (2 of 2) (Discontinued 9/88)

Revised: 9/10/93
Security: Everyone

Apple IIc: Specifications (2 of 2) (Discontinued 9/88)

=====

--Back panel:

1. Power switch
2. Connectors (left to right):
 - a. 9-pin D-type miniature for mouse, joystick or hand controller
 - b. 5-pin DIN serial input and output for a modem
 - c. 15-pin D-type for video expansion
 - d. RCA-type jack for a video monitor
 - e. 19-pin D-type for a second disk drive
 - f. 5-pin DIN serial input and output for a printer or plotter
 - g. 7-pin DIN for the 9 to 20 V DC power unit

6. Electrical:

--External Power Supply: The Apple IIc comes with an external power supply that should be plugged into a regular three-hole grounded outlet. Power enters the machine through the 7-pin connector on the back panel.

- Line voltage: 105V to 129 V AC
- Maximum power consumption: 25W continuous
- Nominal supply voltage: +15 V DC
- Maximum supply current: 1.2 A continuous

--Internal converter:

1. Supply voltages
 - a. +5V (+/- 5%)
 - b. +12V (+/- 6%)
 - c. -12V (+/- 10%)
2. Maximum supply currents
 - a. +5V: 1.5A
 - b. +12V: 0.9A continuous; 1.5A intermittent
 - c. -12V: 100mA
3. Safety and EMC qualifications
 - a. FCC Part 15, Class B Computing Devices
 - b. CSA 22.2, No. 154-1979

c. UL 126Z-Office Machines

7. Environmental:

- External ambient operating temperature: 50 to 104 degrees F
(10 to 40 C)
- Line voltage: 105V to 129 V AC (Normal USA range)
- Relative humidity: 20 to 95%

8. Physical:

- Height: 2.5 in. (6.35 cm)
- Width: 12.0 in. (30.48 cm)
- Depth: 11.5 in. (29.21 cm)
- Weight: 7.5 lbs. (3.40 kg)

--Package

1. 64K Apple IIc system
2. Installation Guide: Setting Up Your Apple IIc"
3. Disk: Apple Presents the Apple IIc Part 1
4. Disk: Apple Presents the Apple IIc Part 2
5. Disk: Apple Presents the Apple IIc Part 3
6. Disk: Apple Presents the Apple IIc Part 4
7. Manual: Apple IIc Owner's
8. External Power Supply
9. Power cord
10. Monitor cable
11. Disk: System Utilities
12. RF modulator to connect IIc to a television
13. Warranty and product registration card

Apple Color Plotter: Business BASIC Chart Maker III (1 of 5)

Revised: 11/7/84
Security: Everyone

Apple Color Plotter: Business BASIC Chart Maker III (1 of 5)

=====

Following is the Business BASIC source code for an Apple Color Plotter demonstration program named "Chart Maker III". Chart Maker III allows you to creates charts and signs that may be plotted. To get started: just startup your system off your Business BASIC diskette, EXEC this file, then save this program to disk. The sample file created by Chart Maker named "C.DESCRPTION" should be saved as a text file.

Pascal: Dollar amount formatter (1 of 2)

Revised: 11/7/84
Security: Everyone

Pascal: Dollar amount formatter (1 of 2)

=====

The following Pascal function allows you to format printed values as dollar amounts. The function uses the APPLESTUFF unit. GET_DOLLARS takes three integer parameters and returns a real value for possible future calculations:

GET_DOLLARS (HPOS, VPOS, LIMIT)

The whole dollar amount is restricted to "LIMIT" number of characters (4 whole numbers). Three additional characters are allowed for the decimal and cents. Character space not used by LIMIT may be used by cents; however, all entries are rounded to the closest whole cent. The resulting number is printed, right justified, on the screen on top of the input characters.

```
writeln ('Enter value:');  
Value:= GET_DOLLARS (20, 10, 4)
```

"Enter value:" is printed on the screen as normal, while the input cursor is positioned at screen location 20,10. Some possible input and corresponding outputs are:

Inputs	Outputs
9999	9999.00
9.99999	10.00
.999	1.00
.99	.99
1234.56	1234.56
123.456	123.46

```

MacPascal: Problem with Text Window Output option

Revised: 9/1/87
Security: Everyone

MacPascal: Problem with Text Window Output option

=====

This article last reviewed: 9/1/87

With MacPascal's "TEXT WINDOW OUTPUT" option, programs outputting to a text file may put garbage in the text file when writeln's are used for output.

Here's a workaround: open text output files under program control.

The program may be printing an undefined variable, probably a string variable. Double check your program for improper variable use. If you determine that this is not the problem, it is possible that you have run across a bug reported in versions of MacPascal.

AppleColor Monitor 100: Fuzzy Display

Revised: 9/30/88
Security: Everyone

AppleColor Monitor 100: Fuzzy Display

=====

This article last reviewed: 11 September 1987

Here are some things to check when the AppleColor Monitor 100 displays a badly-focused image after components have been replaced:

1. Determine which revision of the main PCB you have, and make sure you're replacing it with the same revision. There are two revisions. On a REV 0 logic board, CN17 (blue/white wire) plugs into the small board on the CRT. If CN17 plugs into the main PCB in the upper left hand corner, you have a REV A board. If you need to replace a REV 0 with a REV A, you must also change:

- A. Contrast/brightness control panel for one with the 1.8K resistor between the pots. Make sure that the value of the resistor on the Contrast Assembly is 1.8K NOT 18K Ohms. The color code for correct resistor is Brown/Gray/Red.
- B. The short interconnect cable must be changed. Following are the pinouts for both the REV 0 and REV A cables for the AppleColor Monitor 100:

REV 0 (P/N 970-0999)	REV A (P/N 076-0196)
DB15---Molex-8	DB15---Molex-8
1---4	1---1
2---1	2---2
3---5	3---3
4---2	4---4
5---3	5---5
6---7	6---6
7---6	7---7

2. Swap the power supply. A bad power supply can also cause a fuzzy display.

BASIC: APPEND fix (1 of 2)

Revised: 11/15/84
Security: Everyone

BASIC: APPEND fix (1 of 2)

=====

Yes! There is an APPEND fix! The following four short test programs illustrate the problem. The run command and a short explanation precedes each code.

1. RUN TEST1,D1

This puts a file called 'JUNK' onto the disk in drive 1 with exactly 255 bytes.

```
10 REM TEST1
20 D$ = CHR$(4)
30 PRINT D$;"OPEN JUNK"
40 PRINT D$;"WRITE JUNK"
50 FOR L = 1 TO 8
60 FOR M = 1 TO 29
70 PRINT "A";
80 NEXT M
90 PRINT "A"
100 NEXT L
110 FOR L = 1 TO 5
120 PRINT "A";
130 NEXT L
140 PRINT "A"
150 PRINT D$;"CLOSE"
160 END
```

2. RUN TEST2

This reads the file 'JUNK' and prints it onto your CRT.

```
10 REM TEST2
20 D$ = CHR$(4)
30 PRINT D$;"OPEN JUNK"
40 PRINT D$;"READ JUNK"
50 FOR L = 1 TO 9
60 INPUT ST$
70 PRINT ST$
80 NEXT L
```

```
90 PRINT D$;"CLOSE"
100 END
```

3. RUN TEST3

This attempts to APPEND to the file 'JUNK' the message "THIS IS A TEST".

```
10 REM TEST3
20 D$ = CHR$(4)
30 PRINT D$;"APPEND JUNK"
40 PRINT D$;"WRITE JUNK"
50 PRINT "THIS IS A TEST"
60 PRINT D$;"CLOSE"
70 END
```

4. RUN TEST4

This reads and displays the file 'JUNK' which should now have a last line reading "THIS IS A TEST".

```
10 REM TEST4
20 D$ = CHR$(4)
30 PRINT D$;"OPEN JUNK"
40 PRINT D$;"READ JUNK"
50 FOR L = 1 TO 10
60 INPUT ST$
70 PRINT ST$
80 NEXT L
90 PRINT D$;"CLOSE"
100 END
```

If the APPEND does not take, the display reads an END OF DATA.

Apple supplied the following fix answer to software developers in August, and they have been using it since November, 1983.

"early 1983"	after November, 1983
-----	-----
B683:4C 84 BA JMP \$BA84	B683:4C B3 B6 JMP \$B6B3
\$B6B3-B6CE:ALL ZEROS	B6B3:AD BD B5 LDA \$B5BD
	B6B6:8D E6 B5 STA \$B5E6
	B6B9:8D EA B5 STA \$B5EA
	B6BC:AD BE B5 LDA \$B5BE
	B6BF:8D E7 B5 STA \$B5E7
	B6C2:8D EB B5 STA \$B5EB
	B6C5:8D E4 B5 STA \$B5E4
	B6C8:BA TSX
	B6C9:8E 9B B3 STX \$B39B
	B6CC:4C 7F B3 JMP \$B37F
\$BA84-BA93:PATCH	BA84-BA93:ALL ZEROS

The patch put at \$BA84 has been moved down to \$B6B3, and four extra lines have been added to that patch. Initialize a new diskette after making the above

patch and reboot the system. You can then sucessfully run the test programs above.

BASIC: APPEND fix (2 of 2)

Revised: 11/15/84
Security: Everyone

BASIC: APPEND fix (2 of 2)

=====

For those who do not feel comfortable with the above machine language, use the following procedure to make new slave diskettes with the corrected DOS:

1. Boot the system with an initialized diskette. This loads the old DOS into your Apple.
2. Type in the BASIC program below and RUN it. This will change the old DOS in memory to the corrected DOS.
3. SAVE this program just in case you made a typo.
4. Without rebooting the system, run the 4 test programs above to see if APPEND works correctly.
5. Type NEW; insert a blank diskette, and type INIT HELLO. This creates a diskette with the corrected DOS.
6. Use this new diskette whenever initializing other diskettes; the corrected DOS will be carried over.

Use this BASIC program in step 2 above:

```
10 POKE -18813,76 : POKE -18812,179 : POKE -18811,182
20 FOR I = -18765 TO -18738
30 READ A: POKE I,A: NEXT
40 FOR I = -17788 TO -17773
50 POKE I,0: NEXT
60 PRINT "DONE..."
75 END
80 DATA 173,189,181,141,230,181,141,234,181,173,190,181,141,231,
      181,141,235,181,141,228,181,186,142,155,179,76,127,179
```

Apple Color Plotter: AppleSoft BASIC Chart Maker II (1 of 6)

Revised: 11/15/84
Security: Everyone

Apple Color Plotter: AppleSoft BASIC Chart Maker II (1 of 6)

=====

This is the Applesoft BASIC source for "Chart Maker II", a demonstration program for the Apple Color Plotter. It provides an easy way to create charts and signs with the plotter. Just startup Applesoft, EXEC this file, and save the program to disk.

The file named "C.DESCRPTION" should be saved as a text file. It is a sample file created by Chart Maker and is ready to plot.

```

Apple III Pascal: Reading special keyboard characters (1 of 2)

Revised: 11/15/84
Security: Everyone

Apple III Pascal: Reading special keyboard characters (1 of 2)

=====

Apple III Pascal programs can distinguish:

1. the Open and Closed Apple keys in conjunction with other keys,
2. SHIFT key uppercase characters from ALPHA-LOCK key uppercase characters,
3. keypad numbers from top row numbers, and
4. RETURN, ENTER and CTRL-M from each other, even though they all have the same ASCII value.

The Apple III's console driver two-byte mode makes this all possible. When a program requests this mode, the console driver sends the program two bytes. The first byte returns the expected ASCII character while the second returns information about how the character was entered. The diagrams on pages 135 and 165 of the Standard Device Drivers manual show the format of the information that is returned.

Two successive READs will not receive both bytes because the data is actually presented as a 16-bit word rather than two 8-bit bytes. (BASIC has no provision to accept this type of input.) The following is a Pascal program to demonstrate the Apple III's ability to communicate 16-bit keyboard coding.

```
program TWO_BYTES; {Demo Apple III two-byte keyboard read}
  {By Grover F. Nunnery - Apple Computer Inc. - Charlotte, NC}
  var A, B          : integer;
      Key, Mod_Key: string;

  procedure KBD_MODE (OneTwo: integer); {Console driver request}
    {OneTwo:= 0 requests 1-byte data; OneTwo:= 128 requests two}
    var requestcode: packed record
      channel: 0..1;
      stat_or_ctrl: 0..1;
      request_num: 0..255;
      reserved: 0..63;
    end;

  begin
    requestcode.channel:= 0;
    requestcode.stat_or_ctrl:= 1; {Control request}
```

```
    requestcode.request_num:= 3; {Keyboard Mode}
    requestcode.reserved:= 0;
    UNITSTATUS (1, OneTwo, requestcode);
end; {Kbd_Mode}

procedure READ_TWO; {Reads 2 bytes}
var Two_Bytes: packed record
    A: 0..255;
    B: 0..255
end;

function KEYPRESS: boolean; {Console Status Call -
                             True upon Keypress}

var charcount : integer;
    requestcode: packed record
        channel: 0..1;
        stat_or_ctrl: 0..1;
        request_num: 0..255;
        reserved: 0..63
    end;
begin
    charcount:= 0;
    requestcode.channel:= 1;
    requestcode.stat_or_ctrl:= 0;
    requestcode.request_num:= 5;

LisaTerminal: VT100 Mode

Revised: 7/30/87
Security: Everyone

LisaTerminal: VT100 Mode

=====

When you want to emulate VT100 operation with LisaTerminal, set Lisa to "forget" lines that scroll off the screen. This mode appears to emulate VT100 functions more accurately. You can then set the Lisa to "remember" and download data or text, then set Lisa back for VT100 terminal operation. During this setting and resetting, Lisa does not clear that text which has been "remembered".

Applesoft BASIC: "#" Character in When Printing a Listings

=====

This article last reviewed: 9/11/87

If, when you print out a program listing, you find unwanted "#" characters in front of the line numbers, see if you have issued the command "PR#1" in the program. You need to preface all ProDOS commands with a CHR\$(4), the Control-D character.

The correct Syntax for this command is:

```
PRINT CHR$(4); "PR#1"
```

LisaTerminal: Dialing up another Lisa

Revised: 11/15/84
Security: Everyone

LisaTerminal: Dialing up another Lisa

=====

To dial up another Lisa, or any other computer, you need to have a modem that has an auto answer capability, such as Hayes Smartmodem or an Apple Modem.

1. Make sure that the compatibility settings are the same for both computers.
2. To see what you're typing, set the compatibilities at half duplex.
3. Dial the other modem's phone number. This modem will answer and send back the carrier. When your modem receives the carrier it will tell you that you're connected. Anything that you type or paste will be sent.
4. To terminate the connection, just hang up from the phone menu.

LisaTerminal: Copy and Paste from LisaWrite

Revised: 11/15/84
Security: Everyone

LisaTerminal: Copy and Paste from LisaWrite

=====

When you paste from LisaWrite to LisaTerminal, Terminal expects a carriage return after every line and truncates the line if it is too long. There is a way of getting around this:

1. Copy the LisaWrite document and paste into an off-line LisaTerminal document (one that isn't dialed into anything). The Lisa will put in put in carriage returns for you.
2. Copy it again, dial up, then paste.

There are two problems with this method.

1. The text breaks in the middle of words if you don't have word wrap set. To avoid this, you can set it to 132 characters. There will be less of a chance of breaking in the middle of a word. Alternatively, turn on word wrap.
2. A telecommunications service, such as The Source, may specifically require that the carriage return be within 80 characters. The problem is that LisaTerminal puts that return in the 81st position. Having LisaTerminal set for word wrap will alleviate the problem somewhat.

This information applies to versions 1.0 and 2.0 only. The problem is solved in version 3.0.

LisaTerminal: Setting the baud rate for an Apple Modem

Revised: 11/15/84
Security: Everyone

LisaTerminal: Setting the baud rate for an Apple Modem

=====

The baud rate on the Apple 1200 modem is not unalterable, although how to alter the rate is not very obvious: you alter the rate by passing data to the modem at the rate you want the modem to transmit data. From whichever program you use to send data to the modem, it determines the baud rate of the data it receives and sets itself at that rate. For example, when you set the baud rate of the LisaTerminal program to 300 and instruct the program to auto-dial, LisaTerminal sends the auto-dial message to the modem at 300 baud; from the speed of this message, the modem assumes that you want to be communicate at 300 baud; the modem then alters its rate to 300 baud. Subtle, no? But here's the catch: if you change the baud rate in the program without turning off the modem first, the modem ignores the messages sent to it at the new baud rate. You must turn off the modem if you are going to change the baud rate.

TIFF (Tag Image File Format): Specifications (4 of 7)

Revised: 3/22/88
Security: Everyone

TIFF (Tag Image File Format): Specifications (4 of 7)

=====

This article last reviewed: 12 February 1988

5. The Fields, continued

StripByteCounts

Tag = 279 (117)

Type = LONG

N = StripsPerImage for PlanarConfiguration equal to 1.

= SamplesPerPixel * StripsPerImage for PlanarConfiguration equal to 2

For each strip, the number of bytes in that strip.

No default.

SamplesPerPixel

Tag = 277 (115)

Type = SHORT

N = 1

The number of samples per pixel. Usually 1 for monochromatic data and 3 for color data (i.e. one sample for each of the color planes.)

Default = 1.

BitsPerSample

Tag = 258 (102)

Type = SHORT

N = SamplesPerPixel

Number of bits per sample. Note that this tag allows a different number of bits per sample for each sample corresponding to a pixel. For example, RGB color data could use a different number of bits per sample for each of the three color planes.

Default = 1.

PlanarConfiguration

Tag = 284 (11C)

Type = SHORT

N = 1

- 1 = the sample values for each pixel are stored contiguously, so that there is a single image plane. See PhotometricInterpretation to determine the order of the samples within the pixel data.
- 2 = the samples are stored in separate "sample planes." The values in StripOffsets and StripByteCounts are then arranged as a 2-dimensional array, with SamplesPerPixel rows and StripsPerImage columns. (All of the columns for row 0 are stored first, followed by the columns of row 1, and so on.) PhotometricInterpretation describes the type of data that is stored in each sample plane.

If SamplesPerPixel is 1, a PlanarConfiguration value of 1 is equivalent to a value of 2.

No default.

Compression

Tag = 259 (103)

Type= SHORT

N= SamplesPerPixel for PlanarConfiguration equal to 1 or 2.

Note that a value is provided for each sample, allowing different compression schemes to be applied to different planes of data.

1 = No compression, but pack data into bytes as tightly as possible, with no unused bits except at the end of a row. See also FillOrder. The bytes are stored as an array of type BYTE, for BitsPerSample <= 8, SHORT if BitsPerSample > 8 and <= 16, and LONG if BitsPerSample > 16 and <= 32. The byte ordering of data >8 bits must be consistent with that specified in the TIFF file header (bytes 0 and 1). "Intel" format files will have the least significant bytes preceeding the most significant bytes while "Motorola" format files will have the opposite.

If the number of bits per sample is not a power of 2, and you are willing to give up some space for better performance, you may wish to use the next higher power of 2. For example, if your data can be represented in 6 bits, you may wish to specify that it is 8 bits deep. If you take this approach, you should be sure that MinSampleValue and MaxSampleValue are given correct values (probably 0 and 63 for intrinsically 6-bit data.) TIFF file readers should use MinSampleValue and MaxSampleValue to determine the range of values in the data rather than BitsPerSample.

Rows are required to begin on byte boundaries.

2 = CCITT Group 3 1-Dimensional Modified Huffman run length encoding. BitsPerSample must be 1, since this type of compression is defined only for "binary" images.

3 = Facsimile-compatible CCITT Group 3, exactly as specified in "Standardization of Group 3 facsimile apparatus for document transmission," Recommendation T.4, Volume VII, Fascicle VII.3, Terminal Equipment and Protocols for Telematic Services, The International Telegraph and Telephone Consultative Committee (CCITT), Geneva, 1985, pages 16 through 31. Each strip must begin on a byte boundary. (But recall that an image can be a single strip.) Rows that are not the first row of a strip are not required to begin on a byte boundary. The data is stored as bytes, not words -- byte-reversal is not allowed. Note that the FillOrder field still applies. See the Group3Options field for Group 3 options such as 1D vs 2D coding.

4 = Facsimile-compatible CCITT Group 4, exactly as specified in "Facsimile Coding Schemes and Coding Control Functions for Group 4 Facsimile Apparatus," Recommendation T.6, Volume VII, Fascicle VII.3, Terminal Equipment and Protocols for Telematic Services, The International Telegraph and Telephone Consultative Committee (CCITT), Geneva, 1985, pages 40 through 48. Each strip must begin on a byte boundary. Rows that are not the first row of a strip are not required to begin on a byte boundary. The data is stored as bytes, not words. Note that the FillOrder field still applies. See the Group4Options field for Group 4 options.

32771 = the same thing as Compression type 1 (no compression), except that each row begins on the next available word boundary, instead of byte boundary.

32773 = PackBits compression, a relatively simple byte-oriented run-length scheme.

Data compression only applies to pixel data, as pointed to by StripOffsets. All other TIFF information is unaffected.

To be determined are additional compression schemes for gray and colored images. We encourage your suggestions, especially if accompanied by full specifications and performance information. It is of course desirable to minimize the number of compression schemes that are being used, but this is clearly an area in which extremely significant time and space tradeoffs exist.

Default = 1.

Group3Options

Tag = 292 (124)

Type = LONG

N = 1

This field is made up of a set of 32 flag bits. Unused bits are expected to be 0. Bit 0 is the low-order bit. It is probably not safe to try to read the file if any bit of this field is set that you don't know the meaning of.

Bit 0 is 1 for 2-dimensional coding (else 1-dimensional is assumed). For 2-D coding, if more than one strip is specified, each strip must begin with a 1-dimensionally coded line. That is, RowsPerStrip should be a multiple

of "Parameter K" as documented in the CCITT specification.

Bit 1 is 1 if uncompressed mode is used.

Bit 2 is 1 if fill bits have been added as necessary before EOL codes such that EOL always ends on a byte boundary, thus ensuring an eol-sequence of a 1 byte preceded by a zero nibble: xxxx-0000 0000-0001.

Default is 0, for basic 1-dimensional coding.

Group4Options

Tag = 293 (125)

Type = LONG

N = 1

This field is made up of a set of 32 flag bits. Unused bits are expected to be 0. Bit 0 is the low-order bit. It is probably not safe to try to read the file if any bit of this field is set that you don't know the meaning of. Gray scale and color coding schemes are under study, and will be added when finalized.

For 2-D coding, each strip is encoded as if it were a separate image. In particular, each strip begins on a byte boundary; and the coding for the first row of a strip is encoded independently of the previous row, using horizontal codes, as if the previous row is entirely white. Each strip ends with the 24-bit end-of-facsimile block (EOFB).

Bit 0 is unused.

Bit 1 is 1 if uncompressed mode is used.

Default is 0, for basic 2-dimensional binary compression.

FillOrder

Tag = 266 (10A)

Type = SHORT

N = 1

The order of data values within a byte.

1 = most significant bits of the byte are filled first. That is, data values (or code words) are ordered from high order bit to low order bit within a byte.

2 = least significant bits are filled first.

Default is FillOrder = 1.

LisaTerminal: Cluster Controller

Revised: 11/15/84
Security: Everyone

LisaTerminal: Cluster Controller

=====

The Apple Cluster Controller maintains an interface between an IBM host and the Apple Computer by emulating IBM 3278-2 terminal functions and 3287-1 printer functions. The Controller comes in two flavors:

1. SNA/SDLC, which emulates an IBM 3274 or IBM 3276 Control Unit/Display Station, and
2. BSC (bisynchronous), which emulates an IBM 3271 Control Unit.

The cluster controller does not support low and high intensity displays; otherwise, the terminal and printer functions are completely emulated.

LisaWrite: Letterhead

Revised: 11/15/84
Security: Everyone

LisaWrite: Letterhead

=====

If on the first page you want a larger top margin for a letterhead:

1. set your margins for the second page,
2. click at the beginning of the document,
3. use the RETURN key to space down the required amount.

If you don't want to do this with every document:

1. create a document
2. tear off a new document,
3. put in the required number of RETURNS at the top,
4. save and Put Away the document,
5. make a stationery pad out of the document.

From then on, when you tear off a piece of this stationery, click down near the bottom of the document; this skips the carriage returns for the letterhead and puts the cursor where you want to start typing.

Revised: 7/30/87
Security: Everyone

LisaWrite: Blank Pages

=====

Sometimes there are blank pages at the end of a document. To eliminate them, first click three times at the beginning of the blank page to see if anything is selected. Sometimes there are carriage returns that are carried at the end of the document. If nothing is selected, then all you need to do is save and put away the document. This will get rid of any truly unused pages.

Tech Info Library Article Number:363

Tech Info Library

LisaWrite: Preview Pages

Revised: 3/9/93
Security: Everyone

LisaWrite: Preview Pages

=====

With Preview Pages comes a variety of display problems (including showing the Page ruler and printing):

- pieces of text are displayed in the wrong place,
- the elevator disappears,
- text disappears,
- you cannot print a page in a specified range,
- LisaWrite doesn't display the document past page three.

If you are having such display problems, just avoid using Preview pages or the page ruler. If you are having problems printing a specific page, have that page displayed in the window before you print, or select a larger range. If a large portion of your document is gone, remember DON'T PANIC. That portion of your document is still there; it's just not being displayed. Select Don't Preview Pages, then Save and Put Away the document. When you open the document, it will come back whole.

LisaCalc: Management Techniques

Revised: 11/15/84
Security: Everyone

LisaCalc: Management Techniques

=====

There are some techniques for managing the size of a spreadsheet:

1. Plan Ahead. You can enter the information more easily and, since making changes tends to increase the size of the sheet, planned entries will save you memory.
2. Structure the information to make the row and column lengths fairly even; avoid stretching your spreadsheet too oblong either way. LisaCalc keeps track of all the cells in the grid. Incidentally, this accounts for the printing of blank pages on occasion; since Lisa prints every cell in the grid, even you haven't used them, the blank cells force a page feed.
3. Use Paste Adjusted formulas; unlike regular pasted or entered formulas, they don't take up as much accounting space on a pointer table. However, there are a few things to keep in mind when using Paste Adjust. First, it works best on long formulas pasted into large ranges; Paste Adjusting a small formula to a few cells won't save you any space. Second, LisaCalc, in the process of readjusting formulas, replaces the pointers in the spreadsheet with real formulas. Bigger than the pointer they replace, these Paste Adjusted formulas increase the size of your sheet once you start copying, cutting, pasting, and inserting rows or columns. The reason for this is that the adjusted cells contain a pointer to the original formula with an increment. Plan ahead!

LisaCalc: Cut & Paste With Formulas

Revised: 7/30/87
Security: Everyone

LisaCalc: Cut & Paste With Formulas

=====

When you cut cells, formulas that directly refer to those cells are set to ERROR. When you paste, the formulas will be adjusted to reflect the location of the new cells. If you cut a group of cells and the formulas that refer to them, then paste them to another location, the formulas are automatically adjusted.

ImageWriter II: When It Suddenly Starts Printing in Hex

=====

This article last reviewed: 11 September 1987

It can be distressing when your ImageWriter II unexpectedly prints a hexadecimal code dump. Hex printing is actually a feature of the ImageWriter II that can be very helpful for programmers.

Hex printing occurs when the Select button is pressed when the ImageWriter II is turned on. This can easily happen accidentally, because the Select button is so close to the power switch. If this happens:

1. Turn power off.
2. Turn the printer back on, making sure that the Select button is not pressed.

LisaCalc: Calculation Order

Revised: 7/30/87
Security: Everyone

LisaCalc: Calculation Order

=====

LisaCalc 7/7 doesn't have a specific calculation order -- it simply determines the approach that will make for the fewest possible passes. Therefore, you don't need to worry about placement of formulas in relation to the cells they involve.

LisaCalc 1.0 and 2.0, on the other hand, calculate first by rows, then by columns. They then check to see if both answers are the same. If they aren't the same, LisaCalc calculates by rows again then rechecks the answers. If Calculate Automatically is selected, this process is repeated until two successive calculations yield the same answers, or until 30 seconds has passed. If Calculate Manually is selected, the process is repeated indefinitely.

LisaCalc: Precision Problems

Revised: 7/30/87
Security: Everyone

LisaCalc: Precision Problems

=====

When an IF test uses real numbers, problems with round off can cause incorrect evaluations. For example, say you have the formula

```
IF(A1+A2=A3,"OK","NOT OK")
```

and cell A1 contains 2.1, A2 contains 1.2, and A3 contains A1+A2. Even though the values look identical, the formula will return "NOT OK", because values in an IF statement (A1+A2) have a different precision than values in a cell (A3).

So, when the two values are compared, they are not the same ("NOT OK"), even though logically they are. To avoid this situation, use integer numbers for equality tests -- or, when you use real numbers, add an INT function to your IF statement.

LisaCalc: Lookup

Revised: 11/15/84
Security: Everyone

LisaCalc: Lookup

=====

Please ignore the implication, on page D32 of the LisaCalc Manual, that you can enter more than one range for Range1 in your Lookup statement. In fact, when you enter the second range, LisaCalc assumes that this is Range2.

You can get around this if your Lookup table spans more than one row or column. Consider, for example, a Lookup table to look up a number in the range of 1 to 300. Obviously, this will be more than one column or row. In Cells B1:B254 you have numbers from 1 to 254. In the column to the right (C1:C254) you have the result to return. In Cell B255, instead of entering the value 255, enter 301, a number outside the range of the Lookup table. To the right of that you have a lookup that looks like this:

```
LOOKUP(A1,D1:D46,E1:E46).
```

D1:D46 has the remaining numbers in your Lookup table, the results are to the right in column E. So in your main Lookup Statement you would have this:

```
Lookup(A1,B1:B255,C1:C255)
```

If the number you are looking for in A1 is 260, then the value returned will be the result of the Lookup in Cell C255.

Revised: 6/1/94
Security: Everyone

Apple IIe: Specifications (Discontinued)

--Order #: A2S2064

--Technical Specifications

1. Central Processing Unit (CPU):

- 65C02 microprocessor
- 16-bit address bus; access range 65,536 (64K) bytes
- 8-bit data bus
- Clock speed: 1.02 MHz (Up to 500,000 operations per second)

2. Video:

- Text display modes:
 - a. 40-column text, 24 lines, 5 x 7 dot matrix (suitable for television or monitor)
 - b. 80-column text, 24 lines, 5 x 7 dot matrix (80-column card and monitor required)

3. Graphics display modes:

- Low-resolution 16-color graphics:
 - 1. 40h x 48v color blocks
 - 2. 40h x 40v with four lines of text
- High-resolution 6-color graphics:
 - 1. 280h x 192v dots
 - 2. 280h x 160v with four lines of text.
- Double high-resolution 16-color graphics: 560h x 192 v dots; extended 80-Column Card required)
- All graphics modes may be displayed on a television or monitor

4. Character set:

- Full 128 ASCII characters:
 - 1. 96 characters printable in both upper and lower case
 - 2. 32 control characters

5. Display formats:

- Normal, inverse, flashing, or Mousetext

6. Memory:

- 64K RAM; Apple Extended 80-column card included
- 32K ROM, including:
 1. Applesoft BASIC interpreter
 2. System monitor routine for machine-language programming
 - a. Disassembler
 - b. Automatic I/O device assignment
 - c. Keyboard and screen-editing features
 - d. Diagnostic routines
 - e. 80-column-display firmware
 - f. Mini Assembler

7. Inputs/Outputs:

- Typewriter-style keyboard
 1. Contoured, full-travel keys for easy touch-typing
 2. Generates all 128 ASCII character codes and:
 - a. Two programmable function keys:
 1. OPEN APPLE
 2. SOLID APPLE
 - b. Four directional arrow (cursor-movement) keys
 - c. Special-purpose keys:
 - ESCAPE, CONTROL, CAPS LOCK, DELETE, TAB SHIFT, and RESET
 - d. All keys repeat automatically
- Multipurpose video and memory-expansion slot
- Seven additional I/O slots; full buffered, with interrupt and DMA priority structure
- NTSC-compatible (USA) and PAL color video output
- Monochromatic video output
- Speaker and sound-generation capability
- Game I/O signals:
 1. 3 switch inputs
 2. 4 analog (hand control) inputs
 3. 4 annunciator outputs
 4. 1 strobe output
 5. Ground and +5 volts output
- Cassette input/output

8. Electrical:

- Line voltage: 108V to 132 V AC
- Typical power consumption: 11W
- Maximum power consumption: 60W
- Supply voltages:
 1. +5V (+/- 3%)
 2. +11.8V (+/- 6%)
 3. -5.2V (+/- 10%)
 4. -12V (+/- 10%)
- Maximum supply currents
 1. +5V: 2.5A
 2. +12V: 1.5A
 3. -5V: 250ma
 4. -12V: 250mA
- Safety and EMI qualifications
 1. -FCC Part 15, Class B Computing Devices

2. -CSA 22.2, No. 154-1979
3. -UL 126Z-Office Machines

9. Environmental:

- External ambient operating temperature: 32 to 113 degrees F
(0 to 45 C)
- Maximum temperature on power supply case: 130 degrees F (55 C)
- Relative humidity: 5 to 85%

10. Physical:

- Height: 4.5 in. (11.43 cm)
- Width: 15.13 in. (38.43 cm)
- Depth: 18.0 in. (45.72 cm)
- Weight: 12.0 lbs. (5.45 kg)

LisaCalc: Sorting

Revised: 11/15/84
Security: Everyone

LisaCalc: Sorting

=====

There is a way of sorting in LisaCalc. Let's say, for example, that you wanted to sort a column of numbers (B1:B35) in Ascending order. To do this, you need to set up an additional column of formulas like this:

In the first cell (C1), put

```
search(B1:B35,cell<result,500,cell)
```

In the next cell (C2), put

```
search(B1:B35,cell<result and cell>C1,500,cell)
```

Now, Paste Adjust it to C3:C35, adjusting the C1. This will search the range B1:B35 and sort them in ascending order. The 500 value is any number larger than the largest number in the range. To sort in Descending order, the formulas would look like this:

In the first cell (C1), put

```
search(B1:B35,cell>result,1,cell)
```

In the next cell (C2), put

```
search(B1:B35,cell>result and cell<C1,1,cell)
```

and then Paste Adjust it to C3:C35, adjusting the C1.

Please keep a couple of things in mind when sorting:

1. This method will only sort a single row or column, NOT entire rows or columns as in LisaList.
2. If there are repeats of numbers in the range you are sorting, they will show up as NAs at the end of the list.

LisaDraw: Error 3001 or 3007

Revised: 7/30/87
Security: Everyone

LisaDraw: Error 3001 or 3007

=====

When printing a document, you might receive error message 3001 or 3007 as a result of having entered some text in your document then backspacing over a portion of it.

The BACKSPACE sometimes changes the type style of the text string to the system font, the font used for displaying Lisa menus and messages. Unfortunately, LisaDraw doesn't know how to print the system font.

The text typically displays normally, though it is sometimes displayed in the system font which is easily distinguished when the text contains a "V". Just compare the "V" with the V in the option Save from the File/Print menu. The system font V, just as in the pull down menus, slants towards the right.

The easiest way to resolve this problem is to "Select All" of the document with the Edit menu, change the type style to another type style. Change the typstyle back to what you originally selected if you wish. Then print as you normally would.

The other option is to locate, select and change the font of, or re-enter, the specific offending text. Look for the "V"s as described above, or select Print While You Wait. LisaDraw stops printing when it encounters the offending text string.

LisaDraw: Shrinking and Stretching

Revised: 7/30/87
Security: Everyone

LisaDraw: Shrinking and Stretching

=====

Shrinking and stretching objects in LisaDraw is described

on pp. B19-B21 and C75-C76 of the LisaDraw manual

on pp. 137-138 of the Lisa 7/7 manual

To prevent distorting your objects when you stretch and shrink them, use the handles in the middle (not in the corners) of each side, moving each of the handles the same distance from the center. For example, if you have a 2 x 2 square that you wish to increase to 4 x 4, take the handle at the middle of each side and move it an inch out from the center. To stretch or shrink several objects, group them first.

LisaList: Sorting

Revised: 7/30/87
Security: Everyone

LisaList: Sorting

=====

People frequently use a Text format rather than a Number format for columns of numbers. LisaList, when sorting number formatted fields, sorts them in ascending or descending numerical order. When these numbers are formatted as text, they are sorted via a comparison of letters. This means that all of the numbers that start with 1 (10, 15, 100, 1000, etc.) sort together, the 2's are grouped together, and so on. The only way to reformat the information is to add another column with the proper format, then transfer the information. Sort orders and comparisons are discussed further in Appendix 4 of the LisaList manual.

Macintosh II: Pinouts for Sony CPD-1302 Color Monitor (8/94)

Article Created: 11 September 1989
Article Reviewed/Updated: 05 August 1994

TOPIC -----

This article documents how to connect a Sony CPD-1302 display to a Macintosh.

DISCUSSION -----

To hook a Sony Multiscan (CPD-1302) monitor to a Macintosh II, make an adapter cable from the video card to the monitor (which has a 9-pin D connector).

Here is the pin out description for the adapter cable, using the automatic sync-on-green configuration:

Macintosh DB-15 Pin	Sony DB-9	Signal Name
-----	----	-----
1	1	Ground
2	3	Red
5	4	Green
9	5	Blue
15	8	HSync
12	9	VSync

Pins 7 & 10 can be tied together for VGA Extended Sense Code.

This allows the monitor to support 640x480 VGA and 800x600 SVGA resolutions.

Article Change History:
05 Aug 1994 - Changed pinouts to make it easier to connect to Macintosh computers which provide VGA support.

LisaProject: Scheduled dates

=====

When you enter a scheduled date for a task, LisaProject recalculates the dates to reflect it. However, if the date you entered is thought by the program to be illogical, LisaProject overrides it and enters its own date. The date is underlined just as if you had set it.

LisaProject: Start Date

Revised: 11/15/84
Security: Everyone

LisaProject: Start Date

=====

If your resource or task charts begin on a date other than the date set in your beginning milestone, then you've (most likely) created a task that has no predecessor, or you have encountered the "phantom task box" (very rare).

Large phantom task boxes have been discovered when the LisaProject document is copied and pasted into LisaDraw. The box has also been discovered in LisaProject just off the edge of the schedule. Since these task boxes are usually neither seen nor tied into the project, they take the start date as set

by the calendar. When they do occur, there seems to be no way to eliminate them from your LisaProject document.

Lisa: Error Numbers

Revised: 11/15/84
Security: Everyone

Lisa: Error Numbers

=====

The most common error numbers are described both in the Lisa 1 Owner's Guide (Appendix 3, p. I7 and Appendix 6, p. I25), and in the Lisa 2 Owner's Guide (Appendix 3, p. G59, and on pp. C49-C58). These error messages usually simply indicate a general problem.

Other more specific error messages are located in the Workshop manual. There are three types of error numbers that can be displayed:

1. A single number: xxx

This may be located in the Workshop manual. The number means the error occurred in code located in the Filer. The only exception is if the number starts with a 6 (e.g., 648), in which case the error is related to printing.

2. Two numbers: xxx/xxx

The first number refers to a location in the lower levels of the operating system; the second number is the error code. Sometimes these numbers are reversed, so it's best to look up both in the Workshop manual.

3. Three numbers: xxx/yyy/zzz

xxx: Indicates the system program that died.
yyy: The error number indicating why it died.
zzz: The actual code address where the error occurred.

If you get one of these three-number codes and the first one happens to be a 1033, the second number indicates the problem:

Error	Meaning	Solution
7	I/O problem	reinstall software
10	Parity Error	replace memory
21, 22	program error	none
26, 27	bad source, bad memory	

Here are some other errors that occur during startup. These error numbers in 10700 range are usually accompanied by a crossed out Lisa. Following is a list of these errors:

Error	Meaning
10725	Damaged file system or file contents
10726	Profile error, problem with boot tracks
10727	Memory Error
10728	Boot file is missing or damaged
10729	"
10730	"
10731	"
10732	"
10735	"
10736	"
10737	"

If you encounter one of the above errors:

1. Reinstall the startup software. Refer to p. D50 in the Lisa 1 Owner's Guide, p. C24 in the Lisa 2 Owner's Guide or p. 160 in the Lisa (7/7) Office System manual.
2. If step 1 doesn't work, repair the hard disk, then repeat step 1.
3. If step 2 doesn't work, you may have bad Office System diskettes. Obtain another set, then try steps 1 and 2 again.
4. If steps 1 thru 3 haven't worked, you'll need to reload the software. First, though, erase the information currently stored on your hard disk.

To save documents store on your hard disk:

1. Connect your Profile, if you're using one, to another Lisa and save any files if you can. If you're using a Lisa 2/10, start up your system with another ProFile, then save your documents to it.
2. Then reinstall your software on the hard disk, erasing the present software.

Lisa: Memory Errors

Revised: 7/30/87
Security: Everyone

Lisa: Memory Errors

=====

Error	Meaning
10590	Memory error encountered on startup
1033/10	Error encountered in Office System
System Hang	Memory error encountered - mouse hang

Most memory errors are caused by parity errors, characterized by an unresponsive system and a frozen mouse pointer. Use LisaTest or the extended memory board test to help you determine which of the two memory boards failed.

Something else to keep in mind: memory is set up so that the starting address is on memory board 2, while the data and overflow are on memory board 1. This means that if you experience memory problems on startup, it is probably a result of a bad memory board 2. If you encounter memory errors during the use of an application, it is probably memory board 1. If the system has hung only once, don't be concerned until it happens again or until you get another memory error. Nevertheless, if you get an error during startup, the memory board that is crossed out is bad.

Lisa Workshop: Eliminating LisaBug

Revised: 11/15/84
Security: Everyone

Lisa Workshop: Eliminating LisaBug

=====

For better or for worse, LisaBug is included in the Workshop in the form of two files: SYSTEM.DEBUG and SYSTEM.DEBUG2. In version 1.0 of the software, the mere presence of these two files enables the NMI key (non-maskable interrupt) in the Office System. In later releases of the software, the debugger may be invoked with the NMI key from the Workshop, or from the Office System if you've come directly from the Workshop without first powering down. It can be very distressing when uninitiated users press the NMI key (the minus sign on the keypad) and drop into LisaBug.

To deal with this problem with post version 1 software, power the system down when you're done working in the Workshop and before you use the Office System; alternatively, disable the debugger completely, as described below.

There are two ways to deal with this problem in version 1.0 of the Workshop: change the NMI key code or disable the debugger. The first option is very simple, but lasts only for the duration of the session. The next time you boot your system, the NMI key code is reinitialized to the minus sign on the key pad. To temporarily change the NMI key code for the session, use the following procedure:

1. Enter the debugger by pressing the NMI key (minus sign on key pad).
2. Enter the command "NM 0" RETURN in response to the debugger prompt of ">". This sets the key code from hex 21 (the minus key) to hex 0 (no key)*.
3. Type a "g" RETURN to go back to your starting point.

To respecify the NMI key, specify the key location--not the ASCII code --for the character you want. The table listing the key codes is in the Pascal Language Reference Manual.

To disable the debugger, you have three options:

- A. Delete SYSTEM.DEBUG and SYSTEM.DEBUG2.

- B. Change the names of the two files to something besides names starting with SYSTEM.xxxx. (This allows for easy restoration at a later time.)
- C. Transfer the two files to floppy, thus freeing up the disk space until you wish to restore the debugger.

Note: you must reboot the system before these changes are effective.

Lisa Workshop: Program Termination

Revised: 11/15/84
Security: Everyone

Lisa Workshop: Program Termination

=====

There are a couple of ways to use LisaBug to terminate an infinite loop if your program is in one:

When you find your program in an infinite loop:

1. Press the NMI key (minus key on the keypad) to enter the debugger.
2. If the domain is greater than zero--i.e., 1, 2 or 3--type a "G"o, then RETURN. This brings you back to your program then drops you back into Lisabug.

If the domain is zero or n, Type "UBR" RETURN. If that didn't change the domain to 1, 2 or 3, type "ID PC-4" RETURN, "G" RETURN, then depress the NMI key before proceeding. (It's sometimes hard to get a non-zero domain if the program is caught up in I/O.)

3. Type: "PC o" RETURN.
4. Then type "G" RETURN.

There is another situation that you may get into with procedures such as:

```
Procedure QUIT;  
begin  
    exit(PROGRAM_NAME)  
end;
```

You must include a reference to QUIT in the main program, or the Dead Code Analysis removes QUIT from the object code. To terminate the program, invoke Lisabug with the numeric keypad minus key (NMI), then enter the following immediate commands:

```
br  
ix movem.l d0-a6,-(a7)  
quit
```

You are returned to the Workshop shell when the program terminates.

Additional information on terminating loops may be found in the debugger section of your Workshop manual,

Lisa Pascal: Using Serial Ports

Revised: 7/30/87
Security: Everyone

Lisa Pascal: Using Serial Ports

=====

Here are some suggestions on how to output from the serial ports using Pascal.

Even though the serial ports are not devices for file storage, they must be specified with a dummy file name. The Lisa handles all I/O devices this way. (See the Pascal Operating System Manual.)

```
reset (f, '-rs232a-xyz') where xyz is the dummy name
```

If you're writing a program to talk to some other type of device, such as a card reader or test equipment, review Chapter 2 in the System Software Manual, particularly the section named Device_Control. These procedures describe how to configure the drivers for either port in order to allow communication with other devices.

Lisa Pascal: Creating Shells

=====

To create your own environment shell, merely rename your stand-alone Pascal program to SHELL."something". Once your program is named SHELL.xxx, it appears in the environments window. You may then either start your program up from the environments window, or else set the default to have your program automatically start up when you first power up.

I recommend using Quick Port, now that it's available with Pascal release 3.0, rather than creating a shell for your program. Quick Port is much more versatile, allowing you to cut and paste to the other Lisa applications, print using the Office System print routines, and so on.

Lisa Pascal: Units

=====

It's not possible to create an intrinsic unit. Even though the manual gives you a minimum of information, you can compile a regular unit. You don't have to put it in a library to use it, as with the Apple II and Apple III. To compile a regular unit, just include the following compiler command at the beginning of your unit:

```
{ $U- }  
Unit Sample;  
  Interface  
    . . .  
  Implementation  
    . . .  
end.
```

Include the object code file in your program's USES statement.

Lisa Pascal: Typestyles

=====

Here are the typestyles available to you from QuickDraw that are not described in the manual:

Font #0	system font
Font #1	small icons and symbols
Font #2	LisaDraw shading patterns
Font #3	more icons and symbols
Font #4	ps pitch, 12 point, sans serif
Font #5	ps pitch, 18 point, sans serif
Font #6	ps pitch, 24 point, sans serif
Font #7	15 pitch, 9 point, sans serif
Font #8	12 pitch, 12 point, sans serif
Font #9	10 pitch, 12 point, sans serif
Font #10	ps pitch, 12 point, serif
Font #11	ps pitch, 18 point, serif
Font #12	ps pitch, 24 point, serif
Font #13	12 pitch, 12 point, serif
Font #14	10 pitch, 12 point, serif
Font #18	calculator symbols
Font #19	20 pitch, unknown point, sans serif
Font #20	LisaGraph tic marks
Font #21	18 pitch, sans serif
Font #22	large icons and symbols
Font #49	LisaGuide icons and symbols

- * Pitch is the number of characters per inch; ps pitch is proportional spacing.
- * Point is the size of the characters (1 point = about 1/72 inch).
- * Serifs are the short decorative lines at the ends of strokes in classical typestyles.
- * Sans serif refers to typestyles without serifs.

Use the number of the font as the parameter of the TextFont procedure. Font numbers not listed comprise undefined characters.

Lisa Disks: Disk Is Deteriorating Message

Revised: 11/15/84
Security: Everyone

Lisa Disks: "Disk Is Deteriorating" Message

=====

The dialog box stating that the "Disk Is Deteriorating" indicates that bad blocks have been found on the diskette and that spare good blocks are starting to be used.

A directory on the diskette contains the addresses of good blocks that are used as spares. When you get about as many bad blocks on your diskette as you have spare good blocks, the error message is displayed and the diskette may soon become unreadable.

If you receive a message that the Disk is Deteriorating, it's time to put the documents onto another diskette. However, if the disk works fine in other drives, there may be something wrong with the drive.

Apple II Business Graphics: Specifications (Discontinued)

Revised: 9/10/93
Security: Everyone

Apple II Business Graphics: Specifications (Discontinued)

=====

I. Technical Specifications

A. Language:

- Pascal
- Assembly

B. Format:

- 16-sector diskette.

C. Imaging:

- Graph Types: Scatter, solid-line, dash-line, bar (vertical or horizontal), pie (filled or outline), and multiple overlays
- Color: Six available on color monitor--user-selectable or default values
- Titling/Labeling:
 1. Alphanumeric labeling on x- and y-axis
 2. Auto-scale or user-defined label ranges
 3. Centered titles
 4. Floating titles:
 - any number
 - horizontal or vertical
 5. Tick marks and extended grid lines

D. Graphic Devices:

- Console
- Silentype
- Apple Color Plotter
- Qume Sprint 5 printers
- Hewlett-Packard 7225A/B with 17603A, RS-232 Personality Module
- Houston Instruments DMP-3, -4 high-quality pen plotters

E. Data Manipulation:

- Curves that can be FITed to any data set:
LINE LOGARITHMIC CONSTANT SINE PARABOLA

--Coefficients can be manually set to produce known curves.
--Statistical analyses that can be performed on any data set:
 MINIMUM MEAN MAXIMUM STANDARD DEVIATION SUM VARIANCE
--Either moving average or exponential smoothing may be performed
 with a single command.
--Additional data manipulation commands:
 ADD SHIFT DIFFERENCE SUBTRACT(FROM) DIVIDE(BY/INTO)
 SUM MULTIPLY
--TAKE Files:
 1. Store business Graphics commands in a single file that
 allows multiple, complex plots to be recreated with a
 single command.
 2. WAIT command allows users to insert a timed pause in a TAKE
 file.
--Virtual files:
 1. System allows user to utilize large data files exceeding the
 size of computer memory.
 2. Default virtual file provides space for approximately 90-100
 points.
 3. SET VIRTUAL FILE command allows user to define a virtual file on
 another diskette, greatly expanding the maximum number of points
 to be processed.
--Interchange Facility:
 Generates a Business Graphics data file from these common
 formats:
 1. VisiCalc print files (13- and 16-sector)
 2. ApplePlot (13- and 16-sector)
 3. DIF format
 4. BASIC text files (13- and 16-sector)
 5. Apple Pascal

II. System Configuration:

- A. Apple
 - 1. II Plus with 48K of memory
 - 2. IIe
 - 3. IIC
- B. Two 5 1/4 inch disk drives
- C. Apple Language Card
- D. Video display device
- E. Optional compatible printer and printer controller card
 - 1. With Silentype Interface Card: Silentype
 - 2. With High Speed Serial Interface Card with P8-02 PROM:
 Qume Sprint 5 printers
- F. Optional compatible plotter and plotter controller card
 - With High Speed Serial Interface Card:
 - 1. Hewlett-Packard 7225A/B with 17603A, RS-232 Personality
 Module
 - 2. Houston Instruments DMP-3, -4 high-quality pen plotters

NOTE: Apple Business Graphics includes drivers supporting the printers and plotters mentioned here. Using a special kit, called a Printer/Plotter Installation Kit (PIK), Apple Business Graphics can support other

plotters, letter quality printers, and dot matrix printers.

III. Features

- Enlarges any area of a graph for close study
- User may specify all graph parameters:
 1. axis labels
 2. floating labels
 3. plot colors,
 4. horizontal and vertical axis ranges
- Macro commands can replace multiple command sequences

=====

This is a summary of ways to access the Enviroments window:

- From the Office System, press the on/off switch while holding down the Apple key. (Lisa 1 Owner's Guide, p. G26; Lisa 2 Owner's Guide, p. G55.)
- From the Workshop, (Q)uit the main command line. When prompted to leave the editor, etc., press "Y". Choose Another_Shell to display the Environments window.
- To boot the system up to the Environments window: press any key on the keyboard (except the Caps Lock key) after you hear the double click. (This double click occurs at the end of the self-tests.) If you asked to start up from a specific device by using the "Start Up From..." menu, press any key when you see the large hour glass displayed.

Apple Color Plotter and Apple Writer Interface

Revised: 12/17/84
Security: Everyone

Apple Color Plotter and Apple Writer Interface

=====

The following instructions are aimed at helping you use the Apple Writer IIe word processor to generate text with the Apple Color Plotter.

NOTE: (No.) represents a variable.

Step	Input	Result
1	Boot Apple Writer	
2	Type .LM0 (CR)	Sets left margin to 0
3	Type SP0 (CR)	Plotter command to set paper to 8 1/2 x 11
4	Type LR90 (CR)	Sets printing on Apple Color Plotter horizontal
5	Type MA(No.),0(CR)	Moves plotter to the point on the paper where you want to start plotting. (No.) = any value in millimeters from 0 - 340
6	Type CTRL-P?(CR)	Print Menu
7	Type PD(No.)(CR),(CR)	Sets the slot location (No.) = Super Serial slot location
8	Type LS(No.)(CR)	Sets letter height to any height you desire - please be sure it fits on the page. (No.) = any measurement in graphic unit within the parameters of the page (See Help Chart below)
9	Type PS(No.)(CR)	Commands the Apple Color Plotter to change pens (No.) = Any number from 1-4 with 1 as the default
10	Type PL(CR)	Tells plotter to accept text
11	Enter your text here	
12	Type CTRL-V(CR)	
13	Type CTRL-C(CR)	
14	Type CTRL-V(CR)	This terminates the PL command
15	Type CTRL-P	
16	Type NP(CR)	Sends commands and text to the plotter

USEFUL HINTS:

- o If it doesn't run, first set the CR command (Print Menu) to CR1.

- o There are 1759 graphic units (g.u.) per 8 1/2" edge of paper OR 175.9 mm of usable space. So, each graphic unit = 0.1 mm.
- o To determine the number of characters per line use the formula 1759 g.u. divided by (No.) g.u. per horizontal line on the page.

APPLE COLOR PLOTTER - HELP CHART

# of Characters	# of G.U.	Hght of Chrs across page
2	612	61.2
6	254	25.4
11	148	14.8
17	102	10.2
29	60	6.0
36	48	4.8

Note: Use the 0.3mm pens to generate 6.0mm letters or less

Apple FORTRAN: Specifications (Discontinued)

Revised: 9/10/93
Security: Everyone

Apple FORTRAN: Specifications (Discontinued)

=====

--Order #: A2D0032

--Technical Specifications:

1. Format: 16-sector disks
2. Language:
 - a. Pascal
 - b. Produces P-code, which runs in the Apple Pascal Operating System
3. Intrinsic Functions:
ABS, ACOS, AINT, ALOG, ALOG10, AMAX0, AMAX1, AMIN0, AMIN1, AMOD,
ANINT, ASIN, ATAN, ATAN2, CHAR, COS, COSH, DIM, EOF, EXP, FLOAT,
IABS, ICHAR, IDIM, IFIX, INT, ISIGN, LGE, LGT, LLE, LLT, MAX0, MAX1,
MIN0, MIN1, MOD, NINT, REAL, SIGN, SIN, SINH, SQRT, TAN, TANH

--Package:

1. Disk: Apple FORTRAN System
2. Disk: Apple FORTRAN System
3. Manual: Apple FORTRAN Language Reference

--System Configuration:

1. Computer:
 - a. Apple II
 - b. Apple II Plus with Language Card
 - c. Apple IIe
 - d. Apple IIc
2. disk drive: Apple Disk II

NOTE: While a single drive system is adequate for very small programs, two drives are strongly recommended for ease of operation and more serious program development

3. video display: Monitor II
4. Apple Pascal package

--Features:

1. Industry standard, ANSI X3.9-1978
2. ANSI Standard Subset of the FORTRAN 77 standard
 - Supports enhancements and facilities from the full FORTRAN 77 language
 - Contains enhancements beyond the full FORTRAN 77 specifications:
 1. Compiler directives in the source code permit many files in one compilation.
 2. An additional parameter to the OPEN statement allows you to specify that the file is blocked or unblocked.
 - Minor differences between the ANSI Standard Subset FORTRAN 77 and Apple FORTRAN:
 1. Subprogram names cannot be passed as parameters.
 2. INTEGER and REAL data types have different storage requirements:
 - a. 2 bytes for INTEGER
 - b. 4 bytes for REAL

NOTE: Apple FORTRAN does not support double-precision arithmetic.

3. Apple Pascal Operating System Linker links:
 - FORTRAN P-Code files
 - Compiled P-code
 - Assembled machine code
4. Interfaces to routines in Pascal system library
 - High-res graphics
 - Sound generation
 - Hand control routines
5. Subscript expressions may include array elements and function calls
6. DO statement limits may be defined by expressions, rather than just single variables
7. Input/output (I/O) units may be specified by expressions, rather than just constants or simple variables
8. The I/O list of a WRITE statement may include expressions
9. All combinations of FORMATTED/UNFORMATTED and SEQUENTIAL/DIRECT files are allowed, with the following restrictions:
 - BACKSPACE is supported only for files connected to the blocked devices -- it is not supported for UNFORMATTED SEQUENTIAL files;
 - DIRECT files must be connected to block devices

Lisa and Macintosh XL: Memory and Hard Disk Requirements

Revised: 8/16/85
Security: Everyone

Lisa and Macintosh XL: Memory and Hard Disk Requirements

=====

Lisa Office System:

Hard Disk: Office Systems 1.0, 1.2, 1.4, 2.0, 3.0, and 3.1 all require you to use at least a 5-megabyte hard disk.

Memory: Only Lisa 7/7 Version 3.1 will run with 1/2 megabyte of memory. All previous versions of the Office System require 1 megabyte of memory. If you're using Version 3.1, we highly recommend that you use a full megabyte of memory in order to improve system performance.

Workshop:

Hard Disk: Within certain limitations, you can operate Lisa Pascal Workshop 1.2 without a hard disk; we recommend that you use one, though, unless you aren't concerned about system performance. All subsequent versions of the Workshop require at least a 1/2-megabyte hard disk.

Memory: All versions of the Workshop require 1 megabyte of memory. Versions 1.2 and 2.0 appear to offer you, in the Preferences window, an option to run them with only 1/2 megabyte. If you choose this option, though, the system will hang if you then try to access either the Editor or Preferences.

MacWorks:

Hard Disk: MacWorks Versions B and later do not require a hard disk, though those versions will support one. If you opt not to use a hard disk, the system will simply behave like a Macintosh without an external drive.

Memory: All versions of MacWorks can run with either 1/2 or 1 megabyte of memory.

Lisa 2: Copying Office System Diskettes

Revised: 7/30/87
Security: Everyone

Lisa 2: Copying Office System Diskettes

=====

The easiest way to backup your Office System diskettes is to use Office System 3.1. Release 3.1 allows you to duplicate a diskette to another diskette; it even prompts you when to insert your destination diskette. Office System 3.0 is unable to copy an Office System 1 diskette.

If you don't have access to a Lisa with Office System 3.1, but do have a version of the Workshop which is the same version of the Office System diskettes you're copying:

1. Enter the Workshop.
2. Type "S" to get into the System manager.
3. Set FilesPrivate to Yes; Quit the System Manager.
4. With the File Manager, Copy all of the files on the diskette to the ProFile with a unique prefix--e.g. Copy -LOWER=,ZX=
5. Swap microdisks so the destination diskette is in the drive. Copy all the files back to the diskette, this time stripping the unique prefix--e.g., Copy ZX=,-LOWER=
6. Create as many duplicates as you wish from the prefixed files on the hard disk.

Lisa: How and Why To Back Up Data

Revised: 7/30/87
Security: Everyone

Lisa: How and Why To Back Up Data

=====

Because no computer system is infallible, it is important to periodically back up all important documents. This minimizes the risk of loss of data due to power failure, hard disk failure, system hangs, and so on.

There are 3 kind of backups:

- A. A full backup.
- B. An incremental backup.
- C. Individual duplication of the document onto a backup disk. (This is the method Apple recommends.)

To do a full or incremental backup (method A or B):

- 1. Insert your diskette.
- 2. Duplicate the hard disk, then move the duplicate to the diskette.
- 3. Follow the directions displayed on your screen.

Full and incremental backups are described on pp. D14-D16 in the Lisa 1 Owner's Guide, and on pp. B32-B37 of the Lisa 2 Owner's Guide.

To duplicate a document (method C):

- 1. Select the document.
- 2. Scroll open the File/Print menu; choose Duplicate.
- 3. A flashing duplicate of the document will appear on your screen next to the original. Move that duplicate to another folder, diskette, or drive.

Duplicating a document or folder is described on p. D11 in the Lisa 1 Owner's Guide and p. B68 in the Lisa 2 Owner's Guide.

Tech Info Library

Lisa: Full Backup

Revised: 7/30/87
Security: Everyone

Lisa: Full Backup

=====

A full backup of the Office System 2.0 or 3.0 copies all of your files on the hard disk, including any Workshop files you may have stored there. Backing up a 5-megabyte ProFile may require as many as 20-25 microdisks, while an internal 10-Megabyte disk could require more. Release 1.0 copies only your Office System documents.

Lisa: Incremental Backups

Revised: 7/30/87
Security: Everyone

Lisa: Incremental Backups

=====

An incremental backup theoretically copies only those files that have changed since the last backup. In Office Systems 1.0 and 2.0, the incremental backup does NOT work that way: it copies everything, just as if you had selected a full backup. Because of this problem, Apple recommends in the Lisa 2 Owner's Guide Release Notes: "Do not back up a hard disk icon to the diskette icon. Instead, make duplicates of the tools or documents you wish to back up, and then move the duplicates to the micro diskette icon."

At the end of an incremental backup with release 3.0 software, the error number 941/3 may be displayed. All documents that were changed since the last full backup are copied to the disk. These documents are accessible only from the desktop; they may not be used to restore the ProFile using the Office System 1 diskette's Restore routine. Lisa Office System version 3.1 corrects this problem, allowing you to restore your hard disk from backup diskettes if you wish.

Lisa: Backup Problems

Revised: 3/4/85
Security: Everyone

Lisa: Backup Problems

=====

This article outlines known problems both with backing up Office Systems 1.0 and 2.0 and with restoring from backups of those Office Systems.

Preferences is destroyed by restoring the hard disk from backups. The only way to replace Preferences is to do a full Install (i.e., erase the hard disk and reinstall everything). Instead of restoring the hard disk, then, we advise that you simply duplicate the documents on the desktop individually from the backup disks to the hard disk.

The Lisa 2.0 Owner's Guide, p. B36, item number 7, reads: "Everything on Internal Hard Disk, the Internal Hard Disk, is about to be erased." This error message in the manual is not correct. It does not erase the hard disk; it erases the microdisks. The correct message is displayed on your screen.

Sometimes the backup has difficulties on the 3rd or 4th disk: typically, an error message is displayed stating that there isn't room on the diskette, even though the diskette has just been erased. This seems to happen most often when (a) it's been a long while since installation of the software, (b) the system has hung at one time and a Repair wasn't properly performed, or (c) Office System 2.0 is being used, and some of the files being backed up are very large. (Office System 2.0 has been known to have problems backing up very large files.) Usually, the only recourse is to completely reinstall your software.

Backing up a file larger than 728 blocks onto microdisks is not possible with releases 1.0 or 2.0: as the system tries to copy these large files, it repeatedly asks you to "Insert the next backup diskette" and yet does no copying to these diskettes, because it's looking for a large enough microdisk to back up your entire file. If you have Office Systems 1.0 or 2.0, then, simply make duplicates of any files larger than 728 blocks and place them on your hard disk or onto an additional ProFile instead of trying to back them up onto microdisks. Alternatively, upgrade to Office System release 3.0, which has no problem backing up very large files: it knows how to split a large file into portions and back up the portions onto a series of microdisks.

Apple Writer IIe: How to underline words

Revised: 3/4/85
Security: Everyone

Apple Writer IIe: How to underline words

=====

To implement underlining in Apple Writer IIe:

1. Press the CTRL-P to get to the Print/Program Command Menu.
2. Type UT for "Underline Token", then type some unique character such as a backslash or tilde, and then press Return.
3. Press Return again to get back to the text. Insert the character you chose just before and just after the portion you want underlined: the first character turns underlining on, and the second turns it off. NOTE: You must check to see that your underline token doesn't appear anywhere else in the text so that you don't end up with underlined text where you don't want it.
4. Print the file; the portions between pairs of underline tokens will be underlined.

Some printers may not accept the character that Apple Writer's printing program sends to the printer to start and stop underlining. If your printer expects a special control character to turn underlining on and off, look in your printer's manual to determine which character that is; then, embed the control character before and after the portion of text you wish underlined:

1. Move the cursor to the place where you want the underlining to start.
2. Press CTRL-V; "A V" will appear on the Data Line at the top of the screen. Any control characters that you type at this time will be inserted into the text.
3. Press the control key along with the character that signals your printer to begin underlining.
4. Press CTRL-V to get back to normal mode.
5. Move the cursor to the place where you want the underlining to stop.

6. Press CTRL-V; then, type the control character that signals your printer to stop underlining.
7. Press CTRL-V to get back to normal mode.
8. Print the file; the portions between pairs of control characters will be underlined.

Lisa 2: Possible Problems With The Upgrade Kit

Revised: 11/9/88
Security: Everyone

Lisa 2: Possible Problems With The Upgrade Kit

=====

This article last reviewed: 9 November 1988

1. Symptom: Operating system error 10726, or error 82.
Problem: Bad motherboard-ProFile interaction.
Solutions:
 - A. Replace the motherboard with an upgraded one. (Upgraded motherboards are distinguished by resistor packs around the parallel port.) Also make sure that the system has an I/O board with the resistors clipped and the proper boot ROMs installed.
 - B. Use a different ProFile.
2. Symptom: CPU boot error 43.
Problem: Bad CPU-boot ROM interaction.
Solutions:
 - A. Replace CPU board with upgraded CPU board.
 - B. Use the original Lisa boot ROMs. The only noticeable differences between using the old (version D) boot ROMs and using later revisions are (a) slightly different icons displayed in the Startup Menu, and (b) an apparent option to boot from two drives, though only one drive exists. Careful, though! If you select the top drive, the system hangs and must be reset.
3. Symptom: Blank screen when attempting to boot system after retrofitting.
Problem: Incorrectly labelled or placed CPU ROMs.
Solution:

Verify that the CPU ROMs are installed according to the directions. If they are correctly installed, one or both may be mislabelled. In that case, simply use the old version D boot ROMs instead.

4. Symptom: System goes through self-test, then hangs.

Problem: System is trying to start from nonexistent drive

Solutions:

A. If you're using your old CPU ROM:

Reset the system and tell it specifically what drive to boot from. Preference settings, such as the correct time and the default startup device, may have been lost when you unplugged the system to swap the chips. Since Preference's startup default is drive 1 with the old CPU ROMs, the system probably hung while booting, since (of course) there is no drive 1.

B. If you have the new CPU ROMs installed:

- a. Reinstall the software.
- b. Test the memory boards with LisaTest or the extended memory board test.
- c. Test the memory board #2 by swapping it with with memory board #1 or with one from your spares kit.

LisaGuide: Startup

Revised: 11/15/84
Security: Everyone

LisaGuide: Startup

=====

IMPORTANT FACT: The LisaGuide diskette doesn't contain any system startup instructions, so if you try to start LisaGuide solely from the diskette, a crossed out Lisa icon and an error 10735 is displayed.

To boot LisaGuide: Startup From... the ProFile with your LisaGuide diskette in the drive.

If you're still unable to boot LisaGuide, your Office System or your LisaGuide diskette may be damaged. First, repair and reinstall the Office System startup software as described on p. D50 in the Lisa 1 Owner's Guide or p. C24 in the 2's guide; then, repair the LisaGuide diskette. If LisaGuide still doesn't boot, replace the diskette.

Installing LisaGuide as a Shell

Revised: 11/15/84
Security: Everyone

Installing LisaGuide as a Shell

=====

If you wish, you may install LisaGuide as a shell so that you can access it from the hard disk instead of having to boot it from a diskette. To install LisaGuide as a shell, you'll need go into the workshop and copy all the files on the LisaGuide diskette to the ProFile EXCEPT:

```
{!CATALOG}
{!CATALOG}$R
{!SAVEDESKTOP} BOOT
{!TFCATALOG}
```

CAUTION: If you mistakenly copy these files, the Lisa will see your ProFile as a diskette!

Remember to set FilesPrivate to Yes with the System Manager before attempting to copy any files; then, copy to the ProFile all the files that start with "{" EXCEPT the ones listed above. Finally, change the name of LISAGUIDE.SHELL on your ProFile to SHELL.LISAGUIDE.

Your environments window on the hard disk will now give you the option of starting up LisaGuide the next time you power up.

Using double high-res graphics or a Color 100 on older IIs's

Revised: 2/13/87
Security: Everyone

Using double high-res graphics or a Color 100 on older IIs's

=====

The IIe needs a Revision B Motherboard or an Enhanced IIe Logic Board in order to support double high-resolution graphics or an RGB (Red Green Blue) Color Monitor 100. (The Revision B board differs from the Revision A board in that the RGB signals are sent to slot 7 and the auxilliary slot.) To determine which revision your Motherboard is, look at the back of the board behind the I/O slots: there you'll see the Motherboard's part number. The number will be 820-0064-A or 820-0064-B; the last character tells you whether the board is Revision A or Revision B. If the part number is 607-0187-A, it is an Enhanced IIe and does not need upgrading.

If you have a IIe with a Revision A (820-0064-A) Motherboard and an Extended Text card or an RGB interface card, you can have your Motherboard upgraded to Revision B by exchanging the motherboard.

LaserWriter: Print layout can differ from screen layout

Revised: 7/2/87
Security: Everyone

LaserWriter: Print layout can differ from screen layout

=====

Drivers 3.0 or earlier try to create a resemblance to the screen's image of text. The driver then sends this resemblance to a LaserWriter or LaserWriter Plus.

To create this resemblance, a line layout routine in the driver formats each line extensively, padding the spaces between characters. The routine that does the formatting takes into account that the Macintosh's screen, 512x342 pixels, displays 72 pixels/inch and that the LaserWriter prints 300 dots/inch.

In the complex conversion from Macintosh screen pixels to LaserWriter printer dots, converting a 72 pixel inch to a 300 dot inch and accounting for angles, boldfacing, italicizing, and so on, the result is not always an exact resemblance. While the routine creates a printed line that resembles the screen line in length, the printed line can look different because of the routine's padding between characters.

This padding appears in lines printed with drivers 3.0 or later EXCEPT when fractional pixel widths, disabled by default, are turned on by an application. With fractional pixel widths enabled, the printer driver doesn't use its line layout routine and doesn't measure line length; printing can go as fast as possible.

In case an application enables fractional pixels and thus disables the line layout routine, the designers have made it possible to create a resemblance going the other way: the screen's image of text can be made to resemble the LaserWriter's image of text. This can happen even if text never goes to the LaserWriter.

To match LaserWriter text on the screen, the Macintosh uses FOND resources. FOND resources represent "families" of FONT resources and contain information about the width of each character in the font as if it were printed. To map the printer's ROM-based fonts to the Macintosh's screen fonts, the Font Manager and QuickDraw use these FOND's to calculate the width for the text to be displayed on the screen. To determine line breaks, the application can use these widths as well.

Fonts should be added or deleted from the System File with Font/DA Mover version 3.0 or later to insure that FONDS and Fonts are correctly updated.

For further information refer to "Inside Macintosh: The Font Manager" and/or "LaserWriter Reference Manual".

Macintosh, Apple II: Specifications of Plastic Enclosures (4/94)

Article Created: 22 June 1989
Article Reviewed/Updated: 1 April 1994

TOPIC -----

What kind of materials are the plastic enclosures for Macintosh computers made of?

DISCUSSION -----

Macintosh cases, mouse devices, and keyboard enclosures through the Macintosh SE are made of Cycolac ABS grade KJC plastic.

Macintosh plastic cases, mouse devices, and keyboard enclosures after the Macintosh SE are made of either

- Cycolac ABS grade KJC plastic, rated at 94V-2, or
- Cycolac ABS grade KJW plastic, rated at 94V-0.

The keyboards listed below use unreinforced polyester for the keycaps. The polyester makes the sublimation printing of the legends possible.

There is more than one vendor of polyester: the Apple Standard and Extended keyboards use Celanese Celanex 2000-2 resin.

Vendor information on Asian manufacturers' plastic is not available.

- the Apple Standard and Extended Keyboards
- the Macintosh Plus keyboard
- some Apple IIGS keyboards
- all Apple IIc keyboards
- possibly some Apple IIe keyboards

Other keyboards have ABS keycaps; these keycaps are double-shot to put the legends in a different color plastic.

Information on the plastic used in later keyboards is not available at

this time.

Lisa: When to Repair Your Hard Disk

Revised: 7/30/87
Security: Everyone

Lisa: When to "Repair" Your Hard Disk

=====

Anytime your system resets or falls victim to a power outage or any other kind of abnormal power down, you must "repair" your hard disk. Also consider repairing your hard disk when your system is acting strangely or if you're having difficulties locating or displaying your documents, even if they are located on a diskette. The repair is basically a disk clean-up: it closes any files left open, gets rid of unused scratch files, and then reconstructs the catalog files if necessary.

If you receive the message "the disk needs minor repairs", start up with the Office System 1 diskette to repair your hard disk. If you've just repaired the hard disk using the Office System 1 diskette, perform the "minor repair" as well when given the choice.

The Office System 1 repair is very thorough, while the minor repair merely reconstructs the catalog files.

Note: Repairing the hard disk will delete folders (but not documents) in Office Systems older than version 3.0.

System 4.1: Keyboard Mapping Changes

Revised: 7/16/90
Security: Everyone

System 4.1: Keyboard Mapping Changes

=====

This article last reviewed: 11 September 1987

The Macintosh character set is illustrated on page I-247 of Inside Macintosh, Vol. 1, copyright 1985. All characters that are not shaded in this illustration can be generated on any Macintosh.

With System 4.1, the keyboard mapping changed. It now uses resources in the System file for mapping dead keys. "Dead keys" are those that don't produce a character until a second key is pressed. If the second character is one that is recognized as a proper dead-key combination, then a character is produced. For example, Option-n is a dead key that produces the n-tilde character only if n is the next key pressed.

There are two omissions in the new keyboard maps for System 4.1. The capital A with tilde and capital O with tilde are valid combinations that were omitted from the key map.

Apple IIGS: Problem with Sort Directory When Using One Drive

Revised: 9/16/87
Security: Everyone

Apple IIGS: Problem with Sort Directory When Using One Drive

=====

This article last reviewed: 8/31/87

On single-drive Apple IIGS systems, using Sort Directory on a disk other than the System disk causes a system crash. Before the disk on which the sort is to be done can be inserted, the System disk must first be ejected. When the user chooses Sort Directory from the Apple menu, he or she is prompted to insert the System disk, and the data disk is ejected. When the System disk is again inserted and the OK button clicked, the system crashes.

Here are three workarounds:

- Use the new IIGS Finder.
- Attach another drive to the system so that the System disk doesn't have to be ejected.
- Upgrade the Apple IIGS' memory so that the RAM disk can be used.

Apple IIGS: Chatsworth Optical Mark Reader Compatibility

=====

This article last reviewed: 16 September 1987

The Chatsworth OMR1000 is a popular optical mark card reader that is normally connected to an Apple IIe. It is also compatible with the Apple IIGS, but with one precaution.

The OMR software defaults the slot for the controller card to slot 4. On the Apple IIGS, slot 4 defaults to MOUSE. Before using the OMR1000 with the IIGS, use the Apple IIGS control panel to change Slot 4 for "Your Card".

SCSI Drives: Size Differences After Formatting

Revised: 9/18/87
Security: Everyone

SCSI Drives: Size Differences After Formatting

=====

This article last reviewed: 1 September 1987

SCSI drives formatted under different versions of HD SC Setup may show differing numbers of blocks available, even though the storage capacity of the drives is theoretically the same. This is due to different methods used by various versions of HD SC Setup.

HD SC Setup Version 1.1 checks each drive and formats the disk with that drive's maximum number of blocks. Versions 1.4 and later determine the approximate size of the drive (20MB, 40MB, or 80MB), then format all manufacturers' drives with a set number of blocks. On an HD-20SC, the result is 19,171 blocks. This is the number of blocks available on an Apple HD-20.

Apple made this change in order to provide an easier method of using tape backup systems, and to provide a consistent amount of storage on a hard disk without regard to the computer or drive's manufacturer. Since all 20MB drives formatted with version 1.4 and later will contain the same number of blocks, it is possible to restore a backup from one drive onto another type of drive without encountering problems due to insufficient storage. This will avoid problems that could develop when users compare two "identical" units and find that they have different amounts of disk storage available.

Apple II And II Plus Hardware: Stopping The Blinking Cursor

Revised: 11/9/88
Security: Everyone

Apple II And II Plus Hardware: Stopping The Blinking Cursor

=====

This article last reviewed: 9 November 1988

Hardware generates the blinking cursor on the Apple's screen. You can stop the blinking using this Applesoft program:

```
10 FOR A = 935 TO 941
20 READ B
30 POKE A,B
40 NEXT A
50 POKE 56,167
60 POKE 57,3
70 CALL 1002
80 END
100 DATA 72,41,63,145,40,104,76,27,253
```

This program assumes that you have DOS booted. If you don't have DOS, delete line 70.

After you run the program, the cursor will be a solid block until the RESET key is pressed, until there is an IN#0 command, or until the Apple is turned off.

The cursor can be completely eliminated by changing the 63 in line 100 to a 191.

Apple II Hardware: Apple II vs Apple II+

Revised: 11/20/84
Security: Everyone

Apple II Hardware: Apple II vs Apple II+

=====

The only difference between the Apple II and the Apple II+ is that the Apple II has Integer BASIC and the "old" monitor ROM, while the Apple II+ has Applesoft BASIC and the Autostart monitor ROM. Most of the game programs available today are written in Integer BASIC and most of the business, scientific, and industrial programs require Applesoft, so the selection depends upon what your application requires. Apple offers firmware cards that will supply Applesoft to Apple II owners and Integer Basic to Apple II+ owners.

Apple II Hardware: The Apple II Keyboard

Revised: 11/20/84
Security: Everyone

Apple II Hardware: The Apple II Keyboard

=====

The keyboard on the Apple II has an upper-case-only encoder. It can produce ASCII characters 0 through 95, excluding `_`, `\`, `[`, `CTRL-_`, `CTRL-[`, and `CTRL-\`. The Apple III uses the very same encoder. However, the Apple III also has a second keyboard port; with this port, the Apple III can independently to sense the shift, control, and alpha lock keys, as well as a number of other functions.

You can modify an existing Apple II to allow it to sense whether or not the shift keys are depressed. This modification is supported by system software such as Pascal 1.1 and Pilot, as well as some word processing software. The core of the modification is a wire running from the shift keys to button input 2 of the game I/O port which button input the paddles don't use. This modification is not recommended for in-warranty Apples and should be only performed by an authorized service technician.

Since the modified Apple can sense whether or not the shift key is being pressed, it can distinguish 51 new characters: `CTRL-SHIFT-A` thru `Z` excluding `M`, `N`, and `P`, `SHIFT-A` thru `Z` excluding `M`, `N`, and `P`, `SHIFT-0`, `SHIFT-RETURN`, `SHIFT-ESC`, `SHIFT-LEFT ARROW`, and `SHIFT-RIGHT ARROW`. This raises the total number of distinguishable characters to 141, which easily encompasses the 128 member ASCII character set.

To facilitate the most natural use of the keyboard, software sometimes rearranges the interpretation of these characters so that the keyboard resembles that of a typewriter. Apple has employed several types of keyboards on the Apple II since its introduction, so the modification has two appearances.

1. On the older style keyboard, a wire should be run between pin 2 of the 74LS00 and pin 4 of the keyboard connector on the keyboard.
2. On the newer style keyboard with the "piggy-back" electronic assembly, the wire should be run between pin 9 of the 74LS00 closest to the keyboard connector and pin 4 of the keyboard connector.

In either case, a second wire should connect the bottom of pin 4 at location

..TIL00492-Apple_II_Hardware-The_Apple_II_Keyboard_(TA40714).pdf

A7 to pin 7 at location J14 on the motherboard. Check carefully that the wire isn't connected to pin 7 of H14. The keyboard cable acts as a connection between these two wires.

Apple II Hardware: Character Generator ROM

Revised: 11/20/84
Security: Everyone

Apple II Hardware: Character Generator ROM

=====

To allow you to write programs involving special characters or lower case characters, you can get a 2716 PROM to replace the the character generator ROM in revision 7 and later Apples. This note describes how the characters are mapped in the ROM.

Characters storage uses a scheme of eight bytes per character, arranged in the ROM in the order shown in Table 7 on page 15 of the Apple II Reference Manual. The starting address for each character is the address from Table 7 multiplied by eight. Lower case characters, if desired, should be mapped in place of the numbers and punctuation in columns \$E0 and \$F0.

Each character is made up of eight bytes. Each byte represents one row of dots. The most significant bit of each byte is ignored by the hardware. The lowest-addressed byte of each character is the topmost row of dots of the displayed character. The first and last bits of each row of dots are usually set to zero to supply a two dot space between characters. The bottom row of dots is usually left set to zero to allow a one row space between lines. Some lower case character sets use the bottom row for descenders (the letter "g", for example). This causes overlap when the descender is directly above an upper case letter like "B". The following diagram shows how the characters are built. The three digit hexadecimal number is the hexadecimal ROM address for each byte and the two digit hexadecimal number is the pattern of on and off bits.

\$208	\$08	...*...	\$708	\$00	\$730	\$08	...*...

Apple II Hardware: 6522 Versatile Interface Adapter (2/97)

Revised: 3/3/97
Security: Everyone

Apple II Hardware: 6522 Versatile Interface Adapter (2/97)

=====

Article Created: 21 September 1984
Article Reviewed/Updated: 28 February 1997

TOPIC -----

This article describes the 6522 Versatile Interface Adapter (6522 VIA).

DISCUSSION -----

The 6522 Versatile Interface Adapter (6522 VIA) is a popular integrated circuit for use with microcomputers because it operates in a variety of modes. The precursor to the 6522, the 6520, has been used in several interfaces with no difficulty. Unfortunately, although these two parts have identical timing specifications, their operation is different. The 6520 is very tolerant of operation outside of the parameter limits on its data sheet while the 6522 must have its timing specifications met exactly.

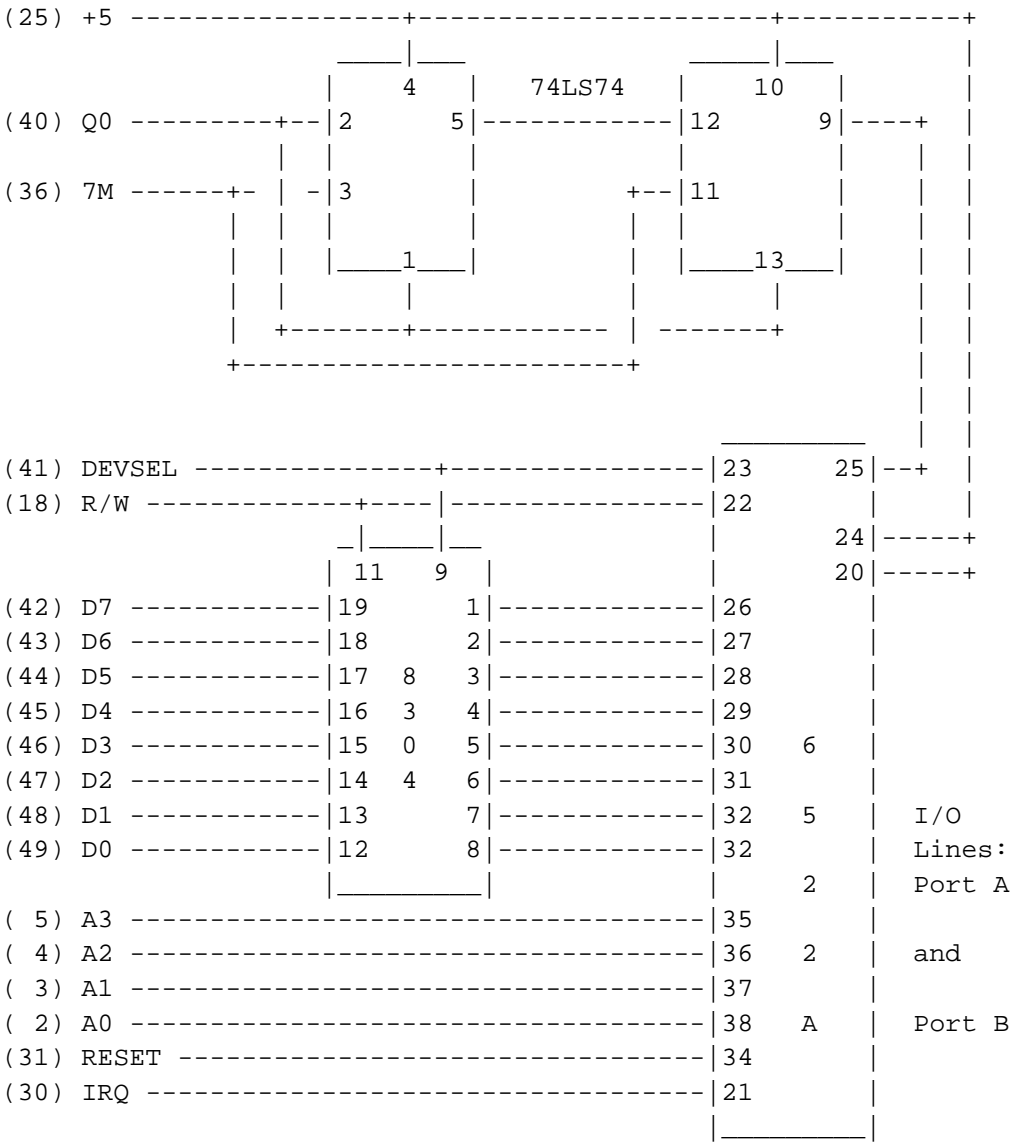

The most critical timing parameter for the 6522 is the address set-up time, the delay between the chip select and the rising edge of the 1MHz clock. The 6522 will not operate under the nearly identical Device Select and 1 MHz clock of the Apple II. The solution is to shorten the positive half-cycle of the 1 MHz waveform. This can be achieved by various methods, but, since the length of the positive half-cycle is critical, it is essential to have a well-controlled circuit to do this.

The circuit below is proposed for use with the Apple II. The 74LS74 circuit delays the positive edge of the clock by one cycle of the 7 MHz clock, generating the clock waveform that the 6522 needs. The negative edge of the clock is set by the falling edge of the 1 MHz clock; this also holds off the flip-flop until the next cycle. The shortened positive half-cycle of the clock waveform results in a leading edge delayed by 140 nanoseconds from the falling edge of Device Select.

The 6522A is required to meet the data sheet timing parameters. The 6522 will usually work but its operation cannot be guaranteed.

The Apple II Cassette Interface (1 of 2)

Revised: 11/20/84
Security: Everyone

The Apple II Cassette Interface (1 of 2)

=====

This note is about the cassette interface built into the Apple II and Apple II+, subroutines. An assumption made here is that the cassette recorder is in the proper mode, play or record, when the read and write routines are executed. Note also that the timing is approximate and may vary from one Apple to another.

A record is a block of binary data. This data may be a BASIC or APPLESOFT program, a machine language program, or just binary data. Records representing BASIC or APPLESOFT programs are really two records, the length of the program and the actual program. A record consists of a header, synchronous bit, the actual data, and a checksum byte for error detection.

Monitor record format

```
+-----+-----+-----+-----+
| HEADER |S|          DATA          |C|
+-----+-----+-----+-----+
```

BASIC program record format

```
+-----+-----+-----+-----+-----+-----+-----+-----+
| HEADER |S| LB |C| HEADER |S|          PROGRAM          |C|
+-----+-----+-----+-----+-----+-----+-----+-----+
```

Key: S = SYNC bit
C = CHECKSUM byte
LB = BASIC program length

The header consists of 10 seconds of 770 Hz tone, (1 cycle equals 1300 microseconds). This gives enough time for the cassette motor to attain speed and the plastic tape leader to go by. A subroutine called HEADR generates a shortened header between the BASIC length bytes and the BASIC program itself. The length of the header tone is controlled by the value of the accumulator on entry to the subroutine. This can vary from 0.2 seconds to 40 seconds. On entry the X register should be 0 and the carry flag should be set. HEADR also generates a synchronous bit at the end of the tone. HEADR resides at

hexadecimal address \$FCC9, or decimal address -882.

The last cycle of header tone and SYNC bit

The synchronous bit, generated by HEADR, is one half cycle of 2500 Hz, (200 microseconds) and one half cycle of 2000 Hz, (250 microseconds). It is used to signal the end of the header tone and the start of the data.

The data is recorded on the tape with a low starting address and a high ending address. Each byte of data is shifted out most significant bit first, least significant bit last. A zero bit is made up of one cycle of 2 kHz, (250 microseconds per half cycle) and a one bit is one cycle of 1 kHz, (500 microseconds per half cycle). This works out to 2000 baud for zeros only and 1000 baud for ones, or an average of 1500 baud.

A zero bit and a one bit

The checksum byte is written on the tape at the end of the data block. All during reading or writing each data byte is EXCLUSIVE OR-ed with the checksum byte. If the checksum computed during a read agrees with the checksum that was written out, then the data is probably good. This method will detect an odd number of errors for any of the eight bits of the byte.

In writing data, the cassette output uses quite simple circuitry, a flip-flop connected through a voltage divider to the jack on the back panel of the Apple. Any time the address \$C020 is accessed this flip-flop changes state. Accessing the flip-flop once every 500 microseconds generates a 1000 Hz tone.

The Apple II Cassette Interface (2 of 2)

Revised: 11/20/84
Security: Everyone

The Apple II Cassette Interface (2 of 2)

=====

For reading data, the cassette recorder uses a more complicated input circuit consisting of a 741 operational amplifier configured as a zero crossing detector. Zero crossing detection means that whenever the voltage at the input jack goes from positive to negative (or negative to positive) the output of the amplifier switches from a 1 to a 0 (or 0 to 1). The detector is accessed by any read to address \$C060. The sign bit (most significant bit) of the byte read reflects the detector status. The read routines continually EXCLUSIVE ORs this bit with the value most recently read to detect a change in state. The amount of time required to change state indicates the incoming frequency which then is used to determine if a one or a zero has been received. After detecting the first zero crossing at the start of the header, the read routine uses HEADR to generate a 3.5 delay, and then the read routine waits for the sync bit. After HEADR generates the synchronous bit, the read routine reads the data and puts it in the specified memory range.

In using the cassette interface to either read or write, all you need do is specify an address range and execute the read or write subroutine. The address range is stored in four bytes, two for the first address to be saved and two for the last to be saved. In both cases the least significant byte is first.

Commanding the cassette interface:

1. from the monitor:

If the start is \$800 and the end is \$9FF, then
800.9FFW will write the data to the cassette and
800.9FFR will retrieve it.

2. from machine language:

Again, if the start is \$800 and the end is \$9FF then store the address range,

```
LDA #$00
STA $3C starting address low
LDA #$08
STA $3D starting address high
```

```
LDA #$FF
STA $3E ending address low
LDA #$09
STA $3F ending address high
JSR $FEDC write to block to tape
```

The JSR \$FEDC will write to the cassette; JSR \$FEFD will read from the cassette.

3. from BASIC:

First set up the address range. If S = the start and E = the end then from integer BASIC,

```
POKE 60,S MOD 256
POKE 61,S / 256
POKE 62,E MOD 256
POKE 63,E / 256
```

4. from APPLESOFT,

```
POKE 60,S - INT(S / 256) * 256
POKE 61,S / 256
POKE 62,E - INT(E / 256) * 256
POKE 63,E / 256
```

Then, to write out to cassette, use CALL -307; to read in from the cassette, use CALL -259.

AppleShare: Types of Programs That Can Run in the Foreground

=====

This article last reviewed: 4 September 1987

These are the three major conditions that a program must meet for it to be an AppleShare foreground application:

- it must be of type FGND.
- it must be in the server folder (so AppleShare can find it) and it can save files only in the server folder (so as not to disrupt the desktop in a manner AppleShare cannot handle).
- it must call SYSTEMTASK often in order to give AppleShare run time.

AppleShare: Problem With Early Version Of TOPS

=====

This article last reviewed: 4 September 1987

When older versions (before September 1986) of TOPS for the Macintosh are used together with AppleShare, an endless loop of error messages ("The Disk need minor repairs" and "Desktop file could not be created") appear when you try to mount an AppleShare volume. Newer versions of TOPS fix the problem.

There is an external file system hook that both AppleShare and TOPS use. Since there is only one hook, and more than one application needs to access it, the solution implemented is to daisy-chain the routines that latch into it. This means that any routine that puts its address in the hook should preserve the address that was previously there, and then call it after it's done performing its tasks. That way, all applications have a chance to examine a filing call if all other applications are well-behaved. While early versions of TOPS daisy-chained properly, and passed on the filing command to other routines, they didn't preserve register values.

FORTRAN: Using WCHAR from FORTRAN

Revised: 11/20/84
Security: Everyone

FORTRAN: Using WCHAR from FORTRAN

=====

This applies to the Apple II, Apple II+, Apple IIe, and Apple IIfx. The Turtlegraphics WCHAR procedure, which writes a single character on the high-res screen, will often give a "Value Range Error" (S#20, P#17, I#11) when called from FORTRAN. WCHAR does not check the high byte of the character word passed before calling the DRAWHBLOCK routine, so if the high byte contains a value, WCHAR will choke by trying to access an index beyond the end of SYSTEM.CHARSET.

This error will occur when passing a single character from a character array, but not from a single character "string". For example,

```
CHARACTER CH(10)
READ (*,100) CH(1)
CALL WCHAR (CH(1))
```

will result in a "Value Range Error". However,

```
CHARACTER*1 CH
READ (*,100) CH
CALL WCHAR (CH)
```

will work correctly. To prevent the error in the first example, replace the call statement with

```
CALL WCHAR (CHAR (ICHAR ( CH(1))))
```

which will convert the character to a integer, and then back to a character before calling WCHAR.

AppleShare: Restoring AppleShare Volumes

=====

This article last reviewed: 4 September 1987

When you restore a backed-up AppleShare volume, all access privileges are lost and the files and folder are property of the Custodian. The Admin program creates a new Server folder (Server2) when it reinitializes the drive for AppleShare.

AppleShare, when determining access privileges, uses the directory IDs to keep track of separate folders. However, when you backup a hard disk and then restore it, all of the ID numbers are reassigned. Consequently, AppleShare can't match up its stored lists of access privileges with what is on the disk. The only solution is to use an 'image backup' device, usually a tape backup. This backup device would in essence make a clone of the hard disk onto a tape, keeping all directory IDs intact, and correctly restoring them later.

The reason for the creation of the folder named Server2 is that AppleShare has also lost track of its older Server folder. When you run the Admin program, it looks for the server volume based on its directory ID. Because the IDs have changed, the Admin program can't find the server folder and notices that there is a folder on the desktop with the name Server. Thinking that the folder belongs to someone other than itself, the Admin program creates a new name (Server2) and uses that. When this happens, you can use the old 'Users & Groups' file to create a new one, and throw out the old Server folder.

FORTRAN: Data file limits

=====

Apple FORTRAN can only allow a total of 16 files to be opened within a program; this number is based on of file identifier blocks available within the Pascal operating system. However, the upper limit on the number of files any one program may open is more likely to be based on the available buffer space (memory) for those files.

Creating FORTRAN Data files

=====

An error in the FORTRAN "CLOSE" statement causes the operating system to mishandle the disk file space. If, within a program, even the smallest data file is created, closed, and reopened, then the system will report that there is no room left on the volume because the CLOSE statement does not release blocks not used in closing the file. When FORTRAN first goes to OPEN a file with STATUS="NEW", FORTRAN looks for, finds, and reserves all unused blocks in the largest available space for the new file. The CLOSE statement does not release the blocks that really are unused after the close, so the second time the OPEN statement (with STATUS="NEW") looks for all unused blocks in the largest available space, OPEN doesn't find any.

One way to avoid this problem is to "Make" a file of the size you will be needing on the given disk; this file will then have STATUS="OLD" and when accessing it, OPEN will not reserve records CLOSE can't release. For example, your program might be creating a data file (by the name of "MYFILE") which will eventually occupy 100 blocks on your data disk (let's call the disk "DATA"). From the Filer, type "M" (for Make), followed by "DATA:MYFILE[100]". This will create the directory entry, reserving 100 blocks for the data file. The FORTRAN program can then OPEN the data file with STATUS="OLD", and the space will be managed correctly. When all the blocks are actually filled, the expected error messages will occur.

FORTRAN: Making the Most of your Disk Space

Revised: 11/20/84
Security: Everyone

FORTRAN: Making the Most of your Disk Space

=====

When using FORTRAN in a multiple-drive system, it is not necessary to duplicate system files on both FORT1: and FORT2:. However, since the SYSTEM.COMPIILER cannot be copied, it is necessary that FORT2: have at least that one file, but the majority of FORT2: can be dedicated to developing programs. Follow the procedure for formatting diskettes and transferring files which is described in the Pascal or FORTRAN reference manuals.

Here are two possible FORTRAN configurations. Your setup will depend on your methods.

1. If you normally don't intend to use the system work file, you may wish to use this configuration:

FORT1: (boot disk)	FORT2:
SYSTEM.APPLE	SYSTEM.COMPIILER
SYSTEM.PASCAL	
SYSTEM.MISCINFO	
SYSTEM.CHARSET	
SYSTEM.EDITOR	
SYSTEM.FILER	
SYSTEM.LINKER	
SYSTEM.LIBRARY	
FORTLIB.CODE	

With this configuration, FORT1: will have only 26 unused blocks, but FORT2: will have 182 blocks available for text and code files. If you exit the Editor by Writing a named file to FORT2: instead of Updating SYSTEM.WRK, you'll have plenty of room to compile and link your FORTRAN programs.

2. If you plan to use the system work file, use the following configuration to leave the majority of free space on the boot disk. This setup may also be used for writing files, of course. The remaining space on FORT2 can be used for files you don't use during development of a particular program.

FORT1: (boot disk)	FORT2:
--------------------	--------

SYSTEM.APPLE	SYSTEM.COMPILER
SYSTEM.PASCAL	SYSTEM.LINKER
SYSTEM.MISCINFO	SYSTEM.EDITOR
SYSTEM.LIBRARY	SYSTEM.FILER
	SYSTEM.CHARSET
	FORTLIB.CODE

For development of text and code with a single-drive system, please consult your FORTRAN reference manual.

Macintosh: Control Panel 3.0 Incompatible with System 3.2

Revised: 5/10/89
Security: Everyone

Macintosh: Control Panel 3.0 Incompatible with System 3.2

=====

This article last reviewed: 3 September 1987

The new Control Panel 3.0 is not backward compatible with older System files. Previously, the setting of the mouse scaling option (set by the Control Panel and used by the System file) was stored in a single bit in the battery backed-up parameter RAM. Because the new system offers a larger choice of scaling options, the format of the saved setting had to change. This is why older version of the System file can't properly read the settings saved by the new Control Panel.

Library Units in FORTRAN with Pascal 1.1 and 1.2

Revised: 11/20/84
Security: Everyone

Library Units in FORTRAN with Pascal 1.1 and 1.2

=====

FORTRAN that runs under Pascal version 1.1 does not access the SYSTEM.LIBRARY in order to find the location of each library segment. Therefore, as a FORTRAN program that uses Library Units (\$USES <filename>) starts to execute, it almost immediately incurs a stack overflow.

A Pascal program which will repair the segment dictionary of a FORTRAN code file is included on the FORT2 diskettes. If your FORTRAN package does not include this program, you may get a copy from your dealer, regional support center, or the International Apple Core on their April 1981 Disk of the Month, named ATTACH. This Pascal program should be used after compiling and linking, but prior to the first execution of each FORTRAN program.

Or you may use another method of forcing the operating system to load the locations of each segment by compiling the following Pascal program:

```
PROGRAM READTABLE;  
USES TURTLEGRAPHICS; (* or any other intrinsic unit *)  
BEGIN  
END.
```

Place the code file on your FORTRAN boot disk, and name that code file SYSTEM.STARTUP. The program will be executed automatically during each boot and will cause the table to be read in.

Apple IIe and IIc: Can't Use Desktop

Revised: 9/17/87
Security: Everyone

Apple IIe and IIc: Can't Use Desktop

=====

This article last reviewed: 3 September 1987

The Desktop program, although it runs under ProDOS 8, was not designed to run on an Apple IIe or Apple IIc. If you look at the memory locations starting at 1000, you'll see:

1000: 18 FB 5C 04 E0 D0

When disassembled, they translate into

1000: 18	CLC
1001: FB	XCE
1002: 5C 04 E0 D0	JMP E0D004

This is the segment of code that the Desktop executes when it exits back to ProDOS. However, those assembly language instructions are implemented only on the Apple IIGS's 65816, not on the Apple IIe's and IIc's 6502.

Graphics Tablet: Quick.Draw (11/96)

Article Created: 21 September 1984
Article Reviewed/Updated: 18 November 1996

TOPIC -----

Below are two BASIC programs that demonstrate how to use Quick.Draw for the Graphics Tablet. Type both programs in, save with the titles listed below and then RUN "START.TEST". "START.TEST" will create an EXEC file and EXEC it. (See DOS manual for further information on EXEC.)

The EXEC file will load "TEST.QUICK.DRAW" above High-Res and run the program. The programs are written with the assumption the Graphics Tablet Interface is in slot 5. Line 20 of the second program controls the slot number.

DISCUSSION -----

```
10 D$ = CHR$ (4)
20 PRINT D$"OPEN START.TEST"
30 PRINT D$"WRITE START.TEST"
40 PRINT "POKE103,1"
50 PRINT "POKE104,64"
60 PRINT "POKE16384,0"
70 PRINT "RUN QUICK-DRAW"
80 PRINT "RUN TEST.QUICK.DRAW"
90 PRINT D$"CLOSE"
100 PRINT D$"EXEC START.TEST"
```

* Save as "START.TEXT"

```
-----
5 DIM X%(500),Y%(500)
10 D$ = CHR$ (4)
20 PRINT D$"PR#5"
30 PRINT "H1,S16,R"
40 PRINT D$"PR#0"
```

```
45 D% = 1:EP% = PEEK (752) + PEEK (753) * 256
46 N% = 0
47 HGR
50 CALL EP%
60 PRINT N%
70 N = N%:  FOR I = 0 TO N:  PRINT X%(I),Y%(I):  NEXT I
100 TEXT

High Speed Serial Interface Card: Qume Sprint 5 (11/96)

=====

Article Created: 21 September 1984
Article Reviewed/Updated: 18 November 1996

TOPIC -----

This article details the setup necessary for the High Speed Serial card and Qume Sprint 5 printer to function together.

DISCUSSION -----

Qume Setup

Form length	11 inches
Character spacing	10 or 12
Twintellect	Standard
Auto LF	On
Parity	Mark
Duplex	Test (For normal operation set to Full)
Baud rate	1200

The two switches inside the cover should be set to "MOD" and "HI".

High Speed Serial Card

Ensure the P8A PROM is installed in location B2 on the card and the switchs are set to the following.

1	2	3	4	5	6	7
Off	Off	On	Off	On	Off	On

Enter and run this BASIC program

```
10 PR# 1
20 PRINT CHR$ (27); CHR$ (26); CHR$ (14)
```

30 PR#0

The Sprint 5 printer will do the Self-Test and print "Self-Test OK", then it will print the entire character set until the Duplex switch is set to Full.

Apple IIGS: Problem Starting Up From Slot 5, Disk II in Slot 6

Revised: 9/16/88
Security: Everyone

Apple IIGS: Problem Starting Up From Slot 5, Disk II in Slot 6

=====

This article last reviewed: 21 September 1987

If you try to start up from a 3.5" disk in a drive connected to slot 5, you may encounter a problem if you have a Disk II drive connected to slot 6. Unlike the UniDisk 5.25" drive, the Disk II drive can't deflect startup attempts if it contains no disk. Instead, it keeps trying to read from a disk that's not there. This is a problem when you want to start up from a 3.5" drive in slot 5.

There are three ways to start up from slot 5 if there's no disk in the Disk II in slot 6:

- Enter the Control Panel and set the startup slot to 5. (After turning on the computer, you have about a second to press Option-Control-Reset before the Disk II drive starts spinning.)

The second and third methods can be used after the Disk II starts spinning.

- Press Control-Reset, which put you in Applesoft BASIC (with the] prompt at the left of the screen). Then type PR#5 to start up from slot 5.
- Press Option-Control-Reset, set the startup slot to 5, exit the Control Panel, and press Control-Open Apple-Reset. This aborts the startup attempt from slot 6 and makes slot 5 the startup slot.

If you need the SCAN option to work properly, you need a Unidisk, Apple IIc External Drive, or an Apple 5.25" drive. These drives can be attached to the Apple IIGS either at the SmartPort connector in the back, with a UniDisk drive controller card, or in a daisy chain off an Apple 3.5" drive connected to the SmartPort. The firmware that drives them can abort a startup attempt if there is no disk in the drive.

Apple IIGS: Getting the LaserWriter to Emulate an Epson Printer

=====

This article last reviewed: 11 September 1987

It is possible for the LaserWriter to emulate an Epson printer. The easiest way to do this is to modify the IWEM file on the Apple IIGS System disk. IWEM is simply a text file with PostScript commands that emulate the ImageWriter commands. If you are familiar with writing in PostScript, then you can change which control codes are recognized and what they do.

Security: Everyone

High Speed Serial Interface: Handshake Modification (11/96)

=====

Article Created: 21 September 84
Article Reviewed/Updated: 19 November 1996

TOPIC -----

Most printers cannot run faster than 300 baud with the High Speed Serial Interface card because it has no printer busy line. This modification uses the existing data input line to sense if the printer is busy and inhibit output if necessary. This modification will work with cassette, DOS 3.2, or DOS 3.3.

DISCUSSION -----

Before making any wiring changes, determine which wire your printer uses to indicate a printer busy or buffer full condition. Your printer's manual should contain this information; failing that, contact the manufacturer.

Examples

IDS 125/225	pin 4
HEATH H-14	pin 4
TI-810	pin 11
SPINTERM	pin 19
COMPRINT	pin 20

Wiring Change

The cable is the preferred place to do the wiring change, but it can also be done to the Serial Card or the printer. Disconnect the wire between pin 2 of the printer and pin 2 on the Serial Card. Then connect the wire with the printer busy signal to the wire for pin 2 on the Serial Card.

Software Patch

To make the software patch, determine which slot the interface will be placed in and type in the software patch below. The patch is customized for this slot number and will not work in a different configuration. The patch forces the computer to access the printer busy signal and wait if it is on.

For the slot number, enter the patch using the values from this table for the words in the <> brackets.

SLOT	1	2	3	4	5	6	7
DATA	90	A0	B0	C0	D0	E0	F0
CODE	C1	C2	C3	C4	C5	C6	C7

Enter the monitor with CALL -155 and type in the following:

```
3B0:A9 <SLOT>
:20 95 FE
:A9 00
:20 ED FD
:A9 C5
:85 36
:A9 03
:85 37
:4C EA 03
:2C <DATA> C0
:30 FB
:4C 07 <CODE>
:00 00 00
```

To check your typing, type "3B0L" and compare your listing to the one below for slot 1.

```
03B0- A9 01    LDA #$01
03B2- 20 95 FE JSR $FE95
03B5- A9 00    LDA #$00
03B7- 20 ED FD JSR $FDED
03BA- A9 C5    LDA #$C5
03BC- 85 36    STA $36
03BE- A9 03    LDA #$03
03C0- 85 37    STA $37
03C2- 4C EA 03 JMP $03EA
03C5- 2C 90 C0 BIT $C090
03C8- 30 FB    BMI $03C5
03CA- 4C 07 C1 JMP $C107
03CB- 00      BRK
03CC- 00      BRK
03CD- 00      BRK
```

Now return to BASIC with "3D0G".

To save the patch to disk, type "BSAVE PATCH, A\$3B0, L\$20".

The first time you use the printer you must load the patch into memory and

initialize the interface. From immediate mode, type:

```
BLOAD PATCH CALL 944.
```

This may also be done from within a program by entering:

```
"100 PRINT D$;"BLOAD PATCH": CALL 944", assuming D$ is a CTRL-D.
```

If you need to turn off the printer, type "PR#0", or in a program enter "200 PRINT D\$;"PR#0"

Then to reconnect the printer, all that is required is "CALL 954", or from a program "300 CALL 954".

If the printer does not print after the CALL 944, it is probably sending the opposite polarity busy signal. The patch can be changed to recognize the opposite polarity signal with by using "POKE 968,16".

If this doesn't work, have the printer checked.

The modification allows the speed, column width, and other variables to be changed with the POKES listed in the card manual.

PostScript: How to Print an Image to a Disk

=====

This article last reviewed: 4 September 1987

How to print a PostScript image "to disk" rather than to a printer:

1. Use the Chooser to select a LaserWriter.
2. Choose the Print... command in the File menu.
3. Click OK.
4. Hold down (don't release them yet) the Command key, and either
 - the K key (to dump a PostScript image with LaserPrep), or
 - the F key (to dump PostScript without LaserPrep).Hold the keys down until you see the Print Status dialog box.

The Print Status dialog box will say something like "Creating PostScript File." When the program is through printing, you will find a text file in your System folder called "PostScriptn," where n is a number.

Macintosh II: Video Overview (1 of 3)

=====

Article Created: 29 September 1989
Article Last Reviewed: 1 July 1992
Article Last Updated:

TOPIC -----

This is the first part of a three-part article describing how the Macintosh II produces video.

DISCUSSION -----

HOW DOES THE MACINTOSH II PRODUCE VIDEO?

Digitized video is a rectangular array of pixels mapped into RAM. This is called bit mapping and it's used by both Macintosh and Apple II computers. At one bit per pixel for black and white images, bit mapping uses up lots of memory. Color images are even more memory-intensive, because each color pixel is defined by a group of bits. A Macintosh II display contains 307,200 pixels (640 x 480), requiring a minimum of 37.5 kilobytes of memory for a monochrome display. A color Macintosh II uses up to eight bits per pixel, and may require up to 300 kilobytes.

The Macintosh II's video card generation circuitry works independently of video memory updates from changing graphics. The signal that controls the speed of the image display process is called a pixel clock, which is produced by an oscillator on the card. Once a graphic image has been stored, it continues to be displayed at the speed of the vertical refresh scan rate: 66.67Hz on the Macintosh II video card. A full screen of video information (307,200 pixels) is displayed 66.67 times per second. This means it takes only 15ms to display an entire screen. A horizontal line (480 pixels) takes only 1/35,000 of a second or .029ms (35KHz scan rate).

The Macintosh II video signal is a linear electrical stream converted from the pixel information stored in the Macintosh II Video Card's RAM. This RAM is called a frame buffer. These bits represent the collective

dots that make up the picture, hence the term bit-mapped graphics. A single bit can represent a single dot of the picture. For example, a bit value of 1 might signify a white dot, while a 0 represents a black dot. More than one bit is needed to represent the dots of a color picture -- a color dot might use eight bits to represent a single dot of a video picture.

Graphics on a Macintosh II are organized into consecutive bits (1, 2, 4, or 8) used to represent pixels. This is a chunky format, also known as pixel mapping. Other possible formats include adding different planes of bits. Each plane is a representation of the screen with a one-to-one correlation of bit to pixel. Adding the bit planes allows a pixel to have an increased value to represent variations in color (planar format). A combination of the two techniques, known as chunky planar, can also be used. An example of such a combination would be to use three separate bit planes or video maps, each with values for red, green, and blue intensities to be combined into the color value for each pixel. The Macintosh II Video Card uses an eight-bit look-up table and chunky format. In binary, a string of eight bits can represent 256 different values: 0 through 255. This allows 256 intensities of red, green, and blue to be defined for each pixel. The 24-bit combinations of 8 bit red, 8 bit green, and 8 bit blue available on the Macintosh II video card generate 16.8 million possible colors (2 to the 24th power). Of the more than 16 million colors, 256 are selected and stored in a look-up table. Colors are then requested by software, and the closest matching color within the table of 256 is selected and stored in the frame buffer for conversion into a video signal of a particular pixel within the picture.

CREATING A VIDEO SIGNAL

To create a video signal recognizable by an analog RGB monitor, each of the 'dots' is converted by the Video Card into a time period of electrical strength by a device known as a digital to analog converter (DAC). The analog signal, or video signal, is a series of picture dots converted into time periods of varying electrical amplitude. A monitor or television is able to convert the signals into an exposure intensity of its phosphor dots known as pixels by a constantly moving electron beam. The beam is controlled by deflection, or sweep, circuits, which produce either electrical or magnetic fields that deflect the beam to hit the screen phosphors and cause them to give off electrons and thus glow. The persistence of the phosphor pixels after exposure to an electron beam creates the glowing dots of the video screen. If the persistence of the phosphor were very short, the video picture might show only a single dot moving across the screen as the electron beam sweeps down the screen, one horizontal line at a time. If the phosphor decay were not equal to the timing of the beam, a flicker may appear where the phosphors have decayed to black, or a ghosting image when the decay rate is longer than the scan. In the case of a color signal, instead of having one beam to turn on pixels, three beams are used. Each picture dot is made up of three pixels: red, green, and blue. Each of the three beams fires only on a color pixel assigned to it. The blocking of the separate beams is done through a shadow mask or aperture grill. This is a metal mask made up of wires on the Apple High Resolution Color Monitor. The spacing between

openings in the shadow mask is known as the grill pitch. The size of the grill pitch enhances the sharpness of the image. When the green beam fires, it is only on the green phosphor dots. The same situation is repeated for the colors red and blue. The strength of the beam is controlled by the signal magnitude received while firing on a pixel and produces the intensity of the color. A color dot might contain all three pixel colors at varying intensities.

Apple Writer 2.1: Revision Utility

=====

There is a patch diskette that fixes the problem Apple Writer 2.0 has with Parallel Cards. With the patch, Apple Writer can work under ProDOS with interface cards that worked with Apple Writer's DOS versions. Although Apple cards will still function normally from patched software, please label this disk.

The patch program is self-prompting. It asks for three or four disk swaps as it updates the Apple Writer disk with prodos 1.1.1 and updates the Apple Writer software with fixes. The fix changes Apple Writer's output routines so that commands go out with the the high bit set, allowing more interface cards to recognize commands.

ProDOS-based software used with parallel cards will probably continue to have this command recognition problem. Apple is telling hardware and software vendors about it and advising that future software and firmware updates take steps to alleviate the problem.

Apple IIGS: A Descriptive List of Interrupts (2/95)

Revised: 2/3/95
Security: Everyone

Apple IIGS: A Descriptive List of Interrupts (2/95)

Article Created: 11 September 1987
Article Reviewed/Updated: 3 February 1995

TOPIC -----

This article describes the list of interrupts on an Apple IIGS.

DISCUSSION -----

To take advantage of the power of the Apple IIGS, its designers installed a new set of interrupts. An interrupt is a hardware signal that tells the computer to stop what it is doing and devote its attention to a more important task. Print spooling and mouse handling are examples of interrupts: they don't take up all the time available to the system, but they should be taken care of promptly.

When an interrupt occurs, the microprocessor jumps to an interrupt- handling routine through a fixed vector in the computer's memory. This routine has to put the state of the machine into a standard configuration, determine the type of interrupt that occurred, and then (if appropriate) command a jump to the user's interrupt-handling routine.

Many types of interrupts are handled automatically for the user. For instance, the serial ports and keyboard can generate interrupts that make it easy to use data buffering. Routines in ROM handle the new user interface, detecting mouse interrupts and moving the mouse around the screen.

Here are the Apple IIGS interrupts and their causes, the actions during the interrupt, and the devices causing the interrupt:

RESET: Caused by startup or RESET keypress. Forces emulation mode. The interrupt is processed by firmware, then vectors to user link. Cold start attempts to boot a disk. Warm start vectors to user links; this link normally points to a BASIC cold start routine. Device: Power switch or RESET key.

NMI: Non-maskable interrupt. Vectors to user link. No NMI interrupts are used by the Monitor.

ABORT: Vectors to user link. If none, then vectors to break handler that displays the address and opcode of the code being executed at the time the abort pin on the 65816 was being pulled low. The ABORT interrupt can be activated by hardware installed in the memory expansion slot only.

COP: Vectors to COP manager vector in RAM, which points to firmware. If the COP manager is not installed, the firmware displays the COP message. This occurs via a software COP instruction only.

BRK: In emulation mode, the interrupt vectors to the interrupt (IRQ) handler and then to the break handler. In native mode, it vectors directly to a break handler. This occurs via a software BRK instruction only.

IRQ: Interrupt request. The remainder of this list describes the IRQ interrupts:

IRQ - AppleTalk: This interrupt has the highest priority because its code is very timing-intensive; data can be lost if the SCC is not read within 104.167 microseconds (230K bd) after an AppleTalk SCC interrupt occurs.

IRQ - Serial Ports: If in interrupt mode, data will be lost if the SCC is not read within 1.094 ms (19.2K bd) after the interrupt occurs.

IRQ - Scan Line: Interrupts, at the most, every 63.694 ms. The interrupt is caused by the video counters counting down to zero, which occurs when the beam reaches the right side of the scan line.

IRQ - Ensoniq Chip: Interrupts when the waveform buffer has been depleted. Because there are 32 oscillators in the chip, there are 32 possible interrupts from the chip.

IRQ - VBL: Interrupts every 16.67 ms. Interrupt occurs when the beam is retracing from the bottom-right corner to the upper-left corner of the screen.

IRQ - Mouse: Interrupts only if the interrupt option is chosen. The interrupt options are movement, button press, or VBL.

IRQ - Quarter-second Timer: Interrupts every 0.2667 seconds. Used by AppleTalk to trigger event processing.

IRQ - Keyboard: Interrupts if a key is pressed.

IRQ - SRQ: If an Apple DeskTop Bus device requires servicing, an SRQ is issued. Control is passed to the SRQ Manager.

IRQ - Desk Accessory Manager: This is called at a simultaneous press of the keys OPEN-APPLE, CTRL, and ESCAPE.

IRQ - Flush: If OPEN-APPLE/CTRL/DELETE is pressed, the keyboard micro clears its internal type-ahead buffer, issues a Flush command to

external keyboards, and causes an interrupt.

IRQ - Micro-abort: If the keyboard micro detects a fatal error and the fatal-error interrupt occurs, the system is interrupted.

IRQ - Clock-chip: Interrupts every second.

IRQ - EXTINT: Interrupt generated by a special device connected to the VGC.

IRQ - External cards: Interrupt as defined by the card manufacturer.

IEEE-488 Interface Card: Time-Saving Hints (11/96)

Revised: 11/18/96
Security: Everyone

IEEE-488 Interface Card: Time-Saving Hints (11/96)

Article Created: 21 September 1984
Article Reviewed/Updated: 14 November 1996

TOPIC -----

Keep the following hints in mind when using the Apple IEEE-488 Interface:

DISCUSSION -----

1. Use the IEEE card only from within an Applesoft program. If you try to use it in command mode, a SYNTAX ERROR will result, since the Applesoft prompt "]" will be sent to the interface. If you do not reset the I/O at the end of your program, a "CMD ERR" will result.
2. Issue the command "SC1" as one of the first commands in any new program. This command will cause the IEEE commands to be echoed to the screen for easier debugging. When the device works properly, the "SC1" can then be removed.
3. Ascertain whether the IEEE device you're using requires the REMOTE ENABLE command before it will accept anything you send it. (Many IEEE devices do require this command.) If the device requires the command and does not receive it, the device will not be enabled: it will handshake properly but won't recognize its address on the bus, and will therefore return a BUS ERROR the next time it's accessed. In some cases, the "RA" command can be used to turn on all remote devices on the bus; likewise, the "RM address list" command can sometimes be used to enable selected devices.
4. Understand the convention for listener and talker addresses. All devices on the bus have a device number in the range of \$00 to \$1E. If you want the device to act as a listener, use the address range \$20 to \$3E--that is, add \$20 to the device number. If you want the device to act as a talker, use \$40 to \$5E--that is, add \$40 to the device number. For example: If an HP 3438A has a device number of 3 and if you want it to be a listener you must use address \$23. From the keyboard, \$23 is a , so you could use (for example) PRINT "TG ". If the device is to be a talker, you must use address

\$43, which is an upper case C from the keyboard; an appropriate command to use would be PRINT "RDC".

Integer BASIC Firmware Card: Switch Options (2/97)

Revised: 2/12/97
Security: Everyone

Integer BASIC Firmware Card: Switch Options (2/97)

Integer BASIC Firmware Card: Switch Options (2/97)

Article Created: 21 September 1984
Article Reviewed/Updated: 12 February 1997

TOPIC -----

Listed below are the two options the user may select when using the Integer BASIC firmware card.

DISCUSSION -----

The Integer BASIC firmware card was designed to supply Integer BASIC to Apple II+ owners. Both hardware and software can be used to supply Integer BASIC to the Apple II+.

Hardware

The position of the switch on the rear of the card is used immediately after a system reset to force the selection of one of two banks of ROMs: the firmware card or the motherboard. If the switch is up then the system will default to Integer BASIC, otherwise the system will default to Applesoft.

Software

By accessing address \$C080, can select Integer BASIC, or, by accessing address \$C081, Applesoft.

NOTE: For systems with Auto Start ROM, every time DOS gets control immediately after a reset, DOS forces a load of the version of BASIC DOS last used, regardless of the position of the switch.

Apple IIGS: ProDOS/16 Version 2

Revised: 9/17/87
Security: Everyone

Apple IIGS: ProDOS/16 Version 2

=====

This article last reviewed: 4 September 1987

To support the new fast mode of the Apple IIGS, ProDOS/16 version 2 handles expanded Apple IIGS capabilities, features, and operating modes:

- ProDOS/16 is designed to accept system calls from applications running in either 8-bit or 16-bit mode (the 65816 micro-processor can run in either).
- ProDOS/16 can accept system calls from anywhere in the full 16MB range of memory in the Apple IIGS, and those calls can manipulate data anywhere in memory.
- ProDOS/16 relies on a sophisticated memory management system.
- System calls must be made to ProDOS/16 in order to access system global variables such as date and time, system level, and I/O buffer addresses. ProDOS/16 does not support a global variables page.

There are major differences from ProDOS 1.1.1. ProDOS/16 not strictly upward-compatible from previous ProDOS versions. Programs written to function under ProDOS on an Apple II will not run on the IIGS under ProDOS/16 without some modifications.

ProDOS/16 functions, however, are upward-compatible:

- There is a functionally equivalent ProDOS/16 call for almost every ProDOS system call, usually with the same name.
- Calls are made in nearly the same way as with earlier ProDOS versions.
- For passing values to functions, the parameter blocks have a structure similar to (but not exactly like) earlier ProDOS.
- ProDOS/16, using the same file system as earlier ProDOS, can read from and write to any disk volume produced by ProDOS, using the same file and volume

structure, both disk resident and logical.

On the Apple IIGS, ProDOS/8 and ProDOS/16 are designed to the run in tandem, as a package. Whereas ProDOS/16 takes advantage of all the Apple IIGS's hardware and capabilities, ProDOS/8 is provided to maintain compatibility with ProDOS v1.1.1. In normal situations, you need not be concerned with which operating system is functioning; if you run an Apple IIGS application, ProDOS/16 is loaded automatically.

While most ProDOS/8 calls have functionally exact equivalents in ProDOS/16, some ProDOS/8 calls do not appear in ProDOS/16 because they are unnecessary:

- RENAME: The ProDOS/16 call CHANGE_PATH performs the same function.
- GET_TIME: Under ProDOS/16, the time and date are obtained through a call to the Miscellaneous Tools.
- SET_BUF: Under ProDOS/16, the memory manager, rather than the application, allocates file I/O buffers.
- GET_BUF: This call is unnecessary under ProDOS/16 because the OPEN call returns a handle to the file's I/O buffer.
- ONLINE: This call is replaced in ProDOS/16 by the VOLUME call.

Under ProDOS/16, you can:

- make ProDOS/16 system calls from anywhere in memory, using ProDOS/16 parameter blocks located anywhere in memory.
- make I/O data transfers to or from anywhere in memory.
- allow limited use of named devices. With ProDOS/8, you must refer to a device by its volume name or its slot and drive number.
- support up to eight system prefixes (ProDOS/8 supports only one).
- have an unlimited number of open files (ProDOS/8 allows only 8).
- have any number of online devices (ProDOS/8 allows a maximum of 14).
- support of at least 3 separate device protocols (ProDOS/8 supports only one block device protocol).
- extensively support named devices.
- use a volume mounting function, not in ProDOS/8, which prompts the user to mount a needed volume.

Using the Old Monitor with the Apple Language Card

Revised: 11/20/84
Security: Everyone

Using the Old Monitor with the Apple Language Card

=====

This applies to the Apple II and Apple II+.

The Apple Language Card gives you all the advantages of the Auto Start ROM whether you have an Apple II or Apple II+. This is because there is an Auto Start ROM on the Language Card that is used instead of the F8 ROM on the main board. There is no way to disable this ROM if you want to use the old monitor in an Apple II. However, there are still two ways to use the old monitor with the Language Card.

1. Replace the Auto Start ROM on the Language Card with an old monitor ROM. In this case, you lose the Auto Start ROM's features when you are in the BASIC that is resident on the main board. The BASIC that is loaded into the Language Card will still be working out of an image of the Auto Start ROM that was loaded with the BASIC. For example, Applesoft would use the old monitor and Integer BASIC would use the Auto start ROM.

2. This method will give you the old monitor while in the BASIC that's in the Language Card but the BASIC on the main board will still access the Auto Start ROM. All you need do is load an image of the old monitor into the Language Card yourself. This is a two step process.

The hard part is to get an image of the old monitor into a DOS binary file. First, boot DOS 3.3 on an Apple II without a Language Card. Then type:

```
INT
BSAVE OLDMON, A$F800, L$800
```

Now all you need is a program or subroutine to load the monitor into the card. The following program fragment must be in Integer BASIC if you have an Apple II or Applesoft if you have an Apple II+. It can be added to the HELLO or APPLESOFT program on the DOS 3.3 Master diskette.

```
10 D$ = "": REM CONTROL D
20 A = PEEK ( -16255): A = PEEK ( -16255)
30 PRINT D$;"BLOAD OLDMON"
40 A = PEEK ( -16254)
```

The old monitor will stay there until you re-boot or reload the Language card.

Language Card: Loading Integer BASIC (2/97)

Article Created: 21 September 1984
Article Reviewed/Updated: 12 February 1997

TOPIC -----

This article describes how Integer BASIC is loaded into the Language card.

DISCUSSION -----

When you boot an Apple II with the BASICS diskette or the DOS 3.3 System Master Diskette, Integer BASIC and the Programmer's Aid #1 are loaded into the Language Card. The code between Integer BASIC and the Programmer's Aid #1 (\$D800 - \$DFFF) is loaded with a completely useless part of Applesoft.

This applies to the Apple II and Apple II+.

LOGO: Silentype printer

Revised: 11/20/84
Security: Everyone

LOGO: Silentype printer

=====

The Silentype dumps the High-Res screen whenever it is sent a CTRL-Q. Once the Silentype has been selected with .PRINTER, it is possible to change its parameters by using .DEPOSIT. Changing the direction parameter from bidirectional to unidirectional will result in significantly better graphics printing. Parameter changes stay in effect until a power cycle or Silentype cold start, so changes made to dump the graphics should be undone after the dump.

A list of parameters with their addresses and possible values appears on page 45 of the Silentype manual. The decimal addresses in the manual are expressed as negative numbers. They can be converted for use with LOGO by adding 65,536 (two to the sixteenth power).

Here is a no-frills Dump with unidirectional printing:

```
TO DUMP :ST SLOT
TYPE CHAR 17
END
```

CHAR 17 is CTRL-Q. :ST SLOT should be set to the number of the slot that the Silentype interface is plugged into.

To dump a negative copy of the screen, with black on the paper where there was white on the screen, change the appropriate parameter:

```
TO NEG DUMP :ST SLOT
TYPE CHAR 17
END
```

LOGO: Reading the graphics screen

=====

The following LOGO code allows the user to determine the setting of the bit of the graphics screen directly under the turtle (HITP), or at any point (DOTP). This code may not give the expected results for colors other than black and white. Depending on HEADING, HITP may not always see the turtle if it is shown.

```
TO HITP
LOCAL "ADDR
MAKE "ADDR (.EXAMINE 916) + (.EXAMINE 127) + 256 * .EXAMINE 128
OP BITP .EXAMINE 917 .EXAMINE :ADDR
END
```

```
TO RESTORE
SETPOS :OLDPOS
SETPEN :OLDPEN
IF :OLDSHOWNP [ST]
END
```

```
TO BITP :BITSIG :BYTE
IF NOT :BITSIG < 128 [MAKE "BITSIG :BITSIG -128]
OP 1 = INT ((REMAINDER :BYTE 2 * :BITSIG) / :BITSIG)
END
```

```
TO DUMP :POSLIST
LOCAL "OLDSHOWNP
MAKE "OLDSHOWNP SHOWNP
LOCAL "OLDPOS
MAKE "OLDPOS POS
LOCAL "OLDPEN
MAKE "OLDPEN PEN
PU
HT
SETPOS :POSLIST
IF HITP [RESTORE OP "TRUE]
RESTORE
OP "FALSE
```

END

LOGO: Saving graphics to disk

Revised: 11/20/84
Security: Everyone

LOGO: Saving graphics to disk

=====

The High-Res pictures can be saved to disk, at the expense of LOGO and the user's workspace. A DOS 3.3 slave diskette should be placed in the disk drive. (Refer to the DOS 3.3 manual for information on slave vs. master diskettes.) Assuming that the disk interface card is in slot 6, type .PRINTER 6 to LOGO; this command boots the diskette, trashes LOGO and the user's workspace, but doesn't damage the High-Res screen buffer.

Now that the Apple is running BASIC with DOS 3.3 in its memory, it is possible to save the High-Res screen buffer as a binary file:

```
BSAVE <filename>, A$2000, L$2000
```

To view the picture, type:

```
HGR  
BLOAD <filename>
```

Applesoft Firmware Card: Options

Revised: 11/20/84
Security: Everyone

Applesoft Firmware Card: Options

=====

The Applesoft firmware card was designed to supply floating point BASIC to Apple II owners. There are two options on the card that the user may select.

1. Most obviously, the position of the switch on the rear of the card is used immediately after a system reset to force the selection of one of two banks of ROMs: the firmware card or the motherboard. If the switch is up then the system will default to Applesoft, otherwise the system will default to Integer BASIC.

2. Software, by accessing address \$C080, can select Integer BASIC, or, by accessing address \$C081, Applesoft.

Unfortunately for systems with Auto Start ROM, every time DOS gets control immediately after a reset, DOS forces a load of the version of BASIC DOS last used, regardless of the position of the switch.

Security: Everyone

LaserWriter: Suppressing Control Characters

=====

This article last reviewed: 21 September 1987

A customer who is spooling PostScript files from a VAX to a LaserWriter wants to know if it's possible to suppress the LaserWriter's EOT acknowledgment or timeout messages.

There is no way to suppress the LaserWriter's EOT acknowledgment. In the PostScript Language Reference Manual, pages 278-279 (copyright 1985, Adobe Systems, Inc., Addison-Wesley Publishing Co., ISBN 0-201-10174-2): "Certain character codes serve special purposes, such as control-D to mark end-of-file. The server performs a job by reading and executing a PostScript program from the serial channel. When it reads the end-of-file character and the program terminates, the server sends an end-of-file character, ends the job, and starts a new one."

The LaserWriter's timeout and job flush message are generated in response to the CONTROL-G from the spooler. The LaserWriter's PostScript command interpreter does not understand the CONTROL-G and generates an error. The spooler does not know the printer is in a timeout/flush mode and continues to send data to the printer. Error messages from the LaserWriter are generated spontaneously and are directed to the standard output file and cannot be suppressed.

Note: The customer may want to consider using DTR for the handshake, eliminating the need for two-way communications with the LaserWriter. This way, the spooler can neither confuse nor be confused with extra control characters. To use DTR on the LaserWriter, the ROMs in the LaserWriter must be revision 2.0.

DOS Tool Kit: HRCG -- Switching it on and off

=====

The High-Res Character Generator can be turned on and off under software control. The following two subroutines will switch back and forth. The software was written assuming the variable "ADRS" is assigned as it is in the subroutine starting at line 2000 of MAXWELL on the Tool Kit diskette.

```
3000 REM          TURN OFF HRCG
3010 PRINT CHR$(4);"PR#0"
3020 PRINT CHR$(4);"IN#0"
3030 HOME
3040 TEXT
3050 RETURN
4000 REM          TURN ON HRCG
4010 CALL ADRS + 3
4020 RETURN
```

Beware: the HRCG overwrites the text screen when outputting to the High-Res screen. It will destroy any information there. You will have to rewrite the text screen after using HRCG.

Using Dow Jones Portfolio Evaluator 1.0 with a Super Serial card

Revised: 5/25/89
Security: Everyone

Using Dow Jones Portfolio Evaluator 1.0 with a Super Serial card

=====

Dow Jones Portfolio Evaluator was designed to work with the Communications card; however, it also works fine with the Super Serial card after you make the change listed below in the DJPE program. The Communications and Super Serial card differ in these three ways:

- * The location of the status and data registers are different.
- * The status register bit arrangement is different
- * The Super Serial card is switch dependent, while the Communications Card must be programmed entirely in software.

Place your Super Serial in slot 2, and then set its switches to:

switch:	SW1		switch	SW2									
1	2	3	4	5	6	7	1	2	3	4	5	6	7
1	0	0	1	0	1	1	1	0	1	1	0	0	0

Note: These settings are not the same as for Dow Jones News and Quotes.

Next, modify the software as shown below:

1. Load Login
2. Unlock Login, then make these changes.

```
5710 ST=49321: rem addr of SS status
5720 DA = ST - 1: rem addr of SS data
5730 print : print chr$(4)"pr#2": print chr$(24)
5740 print chr$(4)"pr#0
5780 for I = 1 to len (I$):wait ST, 16: poke DA,
      asc(mid$(I$, I, 1)): next I
5840 I = peek (772): if I = 8 then I = 1 : rem err flag
```

3. Save Login

4. Load Fetch

5. Unlock Fetch, then make these changes:

```
6910 wait ST, 16: poke DA, 17: rem Xon
7120 if IN = 1 then wait ST,16 : poke DA,19 : run
7200 if 5 * int (S / 5) <> S then wait ST, 16:
```

```
        poke DA, 17: goto 7360
7300 wait ST,16: poke DA,17: rem Xon
7900 ST=49321: rem addr of SS status
7910 DA = ST - 1: rem addr of SS data
7920 print : print chr$(4)"pr#2": print chr$(24)
7930 print chr$(4)"pr#0
7970 for I = 1 to len (I$): wait ST, 16: poke DA,
      asc ( mid$ (I$,I,1)): next I
8030 I = peek (772): if I = 8 then I = 1: rem err flag
```

6. Save Fetch

```
7. Bload Com22.obj
8. Unlock Com22.obj
9. Call -151
10. Enter 341:8 N 343:A9 N 34C:A8
11. Bsave Com22.obj,A$300,L$B1
12. Enter "fp" to enter Applesoft.
```

DOS 3.3: Commands ignored

Revised: 3/10/86
Security: Everyone

DOS 3.3: Commands ignored

=====

The CTRL-D of a DOS command must be the first character on an output line and must immediately follow a carriage return. If it doesn't, the command is printed on the screen or to the printer, but is ignored by DOS.

GET or PRINT statements that end with one of the following often cause this problem:

- * ";" semi-colon
- * "," comma
- * tab
- * space

A PRINT statement on the line above a DOS command generates the necessary carriage return; alternatively, define D\$ as a carriage return and a CTRL-D:

```
10 D$ = chr$ (13) + chr$ (4)
```

DOS commands are also ignored when improperly used. IN# and PR# DOS commands, for example, must be sent out as:

```
10 print chr$(4);"IN#0"  
20 print chr$(4);"PR#0"
```

For further explanation, refer to pages 100 through 103 of The DOS Manual or page 25 of The DOS Programmer's Manual.

Macintosh II Video Card: Features (2/95)

Revised: 2/14/95
Security: Everyone

Macintosh II Video Card: Features (2/95)

=====

Article Created: 18 September 1987
Article Reviewed/Updated: 14 February 1995

TOPIC -----

This article describes the original Macintosh video card.

DISCUSSION -----

The Macintosh II video card provide scolor capability for simultaneous display of up to 256 colors on the Apple High Resolution Color Monitor. With the card's three 8 bit digital to analog converters (RGB) there are more than 16 million possible colors to choose from.

Color Modes

- One bit per pixel for 2 color output
- Two bits per pixel for 4 colors
- Four bits per pixel for 16 colors
- Optional Eight bits per pixel for 256 colors

Video Signals

- RS343 Analog RGB for Apple High Resolution Color Monitor
- RS343 Analog Green signal for Apple High Resolution Monochrome Monitor
- RS170 Composite interlaced video for analog RGB monitors, film recorders and projection TV's
- RS170 Analog Green signal for composite interlaced video with sync for analog monochrome monitors, film recorders, and projection TV's

Hardware Features

- Multiple video card operation for larger screen area For example, 2 cards handle 2 video screens for viewing different or large format documents.

- Standard VIDEO RAM configuration of 256K for 1, 2, and 4 bit color modes 8 chips of 150NS 64x4 KBit Video RAM.

- Upgraded VIDEO RAM configuration of 512K for 8 bit color mode 8 additional chips of 150NS 64x4 Kbit Video RAM

*** Video RAM contains a shift register for the copying of rows of bits from the RAM array. This allows reads and writes to the RAM array and the shift register simultaneously. This is not a feature of standard or common RAM and is necessary to the workings of the video card.

- Two Oscillators provide timing signals of:
30.24MHz for Macintosh II monitors (RS343)
12.27MHz for RS170 monitors (Composite Monochrome interlaced video)

- Slot independent operation

- Triple 8 bit digital to analog converters for 2 to the 24th colors equalling 16.8 million.

Article Change History:

DOS 3.3: The I/O vectors

Revised: 11/20/84
Security: Everyone

DOS 3.3: The I/O vectors

=====

The Apple monitor sends all input and output, including Applesoft and Integer BASIC's I/O, to a pair of two byte vectors. DOS takes the contents of these vectors and saves them to memory, then puts pointers to itself in the monitor's I/O vectors.

DOS is no longer able to intercept commands when the I/O vectors are changed. A DOS routine starting at \$3EA, accessible from BASIC with call 1002, checks the monitor I/O vectors to see if they point to DOS. This routine stores the current values in the I/O vectors and points to DOS in the vector if DOS isn't already there. It's most useful when the I/O vectors need to be modified to a custom I/O routine like the High-Res Character Generator routine in Contributed Software, volume 3. Here's how to use the Character Generator and DOS:

```
10 poke 54,0
20 poke 55,96
30 call 1002
40 print chr$(4);"catalog"
50 print chr$(4);"PR#0"
```

DOS 3.3: INTBASIC and FPBASIC on the master diskette

Revised: 11/20/84
Security: Everyone

DOS 3.3: INTBASIC and FPBASIC on the master diskette

=====

The INTBASIC and FPBASIC files on the master diskette load automatically into your Language Card if you have one. Since these files are written to operate specifically in the memory space of the Language Card, they don't work anywhere else.

To use Applesoft with your Apple II (which has Integer BASIC built in), you need either the Applesoft Firmware Card or the Language Card installed into your system.

Apple II+s have Applesoft built in; therefore, your system needs the Integer BASIC firmware card or a language card to use Integer BASIC.

DOS 3.3: Hiding machine language routines above the file buffers

Revised: 11/20/84
Security: Everyone

DOS 3.3: Hiding machine language routines above the file buffers

=====

It's possible to position your machine language routines between DOS and its first file buffer so that they won't be overwritten by BASIC programs.

Since \$9D00 and \$9D01 (48K system) point into the first, highest buffer:

1. Add the number of pages (256 byte blocks) your routine needs to the contents of \$9D01.
2. Put a \$00 in the address now pointed at by the contents of \$9D00, \$9D01.
3. Store a \$00 at the address pointed at by the contents of \$9D00, \$9D01 plus \$25.
4. Perform a JSR \$A7D4 to rebuild the DOS file buffers and move the current BASIC's HIMEM down.

The first available address for your routine is the address pointed at by the contents of \$9D00, \$9D01 plus \$2D.

DOS 3.3: Interrupts (IRQ)

Revised: 11/20/84
Security: Everyone

DOS 3.3: Interrupts (IRQ)

=====

Interrupting the Apple's 6502 microprocessor while using DOS can be treacherous. DOS uses location \$45 when converting your decimal numeric parameters to hexadecimal for its internal use. Similarly, the monitor's interrupt handler uses \$45 to save the 6502 accumulator. So, if an interrupt occurs while DOS is executing a command, the numeric parameters DOS uses when it executes commands are changed. Also vulnerable is the sector length of the files listed in a catalog, since DOS also uses \$45 to display this length.

Since DOS uses timing loops during its read and write operation, interrupting the Read Write Track Sector routines can kill a disk. DOS protects itself from IRQ, but has no control over NMI (nonmaskable interrupt)--so don't use a NMI while using DOS.

DOS 3.3: Not Direct Command Error

Revised: 11/20/84
Security: Everyone

DOS 3.3: "Not Direct Command" Error

=====

A "Not direct command" error is caused by invoking certain DOS commands from a machine language routine. When DOS receives commands, it checks to ensure the current BASIC interpreter is running in order to allow you to respond to an input statement with "Running", instead of trying to run the "Ning" file. The commands which cause these errors are listed on page 122 of the DOS manual. The following relocatable machine language routine insures that DOS is satisfied.

LDA #\$80	
STA \$33	This location must not equal \$DD
STA \$76	This location must not equal \$FF
STA \$D9	This location must be greater than \$7F
RTS

LaserWriter 2.0 ROM: Changes to Data Rates for Serial I/O

=====

This article last reviewed: 4 September 1987

In general, the information here supersedes corresponding material in Appendix D of the PostScript Language Reference Manual (copyright 1985, Adobe Systems Inc., Addison-Wesley Publishing Co., ISBN 0-201-10179-3); you should refer there for further information.

The LaserWriter's serial communication capability has been enhanced. The maximum baud rate has been increased from 9600 to 57600 bits per second.

While the default mode of operation of the LaserWriter's serial I/O remains the same as the original LaserWriter, the new capabilities must be explicitly enabled if desired. This is accomplished by executing 'setscbatch' or 'setscinteractive' operators as described in the PostScript Language Reference Manual.

The baud operand of 'setscbatch' or 'setscinteractive' may now be any positive integer less than 100000. The hardware can achieve only certain baud rates; other values will be rounded to the nearest achievable one. Above 9600 baud, the achievable rates are:

10473, 11520, 12800, 14400, 16457, 19200, 23040, 28800, 38400, and 57600.

Of these, 19200 is the most likely to be supported by the host operating systems.

DOS: Version 3.3 and the language card

=====

At power up, DOS 3.3 looks at location \$E000, both on the motherboard and on the firmware card, to check which version of BASIC is available. If a Language card is present, DOS tries to jump into some random information on the card. This jump is prevented by a machine language routine that places a \$00 at \$E000 on the Language card during booting. This routine is stored on the DOS diskette at track 0, sector 9, starting at byte \$D3

LaserWriter 2.0 ROM: Changes to Font Cache

Revised: 9/29/87
Security: Everyone

LaserWriter 2.0 ROM: Changes to Font Cache

=====

This article last reviewed: 4 September 1987

Operation of the font cache has changed somewhat. Formerly there was a single limit on the number of bytes occupied by a character in the cache; a character larger than that would not be cached. Now there are two cache thresholds, upper and lower. If a character is larger than the upper threshold (as determined by the bounding box specified to 'setcachedevice'), it will not be cached, otherwise it will be. If a character is cached and is larger than the lower threshold, it will be compressed, otherwise it will be stored as a full pixel array.

The two thresholds are manipulated by the new operators 'setcacheparms' and 'currentcacheparms', described below. The old operators, principally 'cachestatus' and 'setcachelimit', remain valid. PostScript programs rarely deal with these operators.

Although they consume much less space in the font cache than full pixel arrays (by a factor of up to 40), compressed characters require more computation to reconstitute when they are needed. Reconstituting a compressed character is still substantially faster than re-executing the original character description. In systems printing at 300 pixels per inch or less (including the LaserWriter), the default lower threshold is set so that characters up to about

20 points are stored as full pixel arrays while larger ones are stored in compressed form. Caching of regular-sized body text occurs with the full pixel array representation which is time-efficient while caching of large characters occurs with the compressed representation which is space-efficient.

LaserWriter 2.0 ROM: Problems the New ROMs Haven't Fixed

=====

This article last reviewed: 4 September 1987

Nearly all the problems described in section D.7 of the PostScript Language Reference Manual (copyright 1985, Adobe Systems, Inc., Addison-Wesley Publishing Co., ISBN 0-201-10174-2) have been fixed in the new LaserWriter software. The only unsolved problems are:

- The readline problem described under 'Input/output problems'
- The BuildChar problem, described under 'Font and cache problems'
- The manualfeed problem, described under 'Miscellaneous problems'

The first of these should be considered a property of all PostScript printers when connected to AppleTalk; the latter two are peculiar to the LaserWriter.

PostScript: Language change incorporates packed arrays

Revised: 9/18/87
Security: Everyone

PostScript: Language change incorporates packed arrays

=====

This article last reviewed: 4 September 1987

Several additions have been made to the standard PostScript language. These additions are upward-compatible and do not affect the function of any existing PostScript programs. The changes are included in the new LaserWriter, LaserWriter Plus, and other PostScript printers; they will be documented in a future edition of the PostScript Language Reference Manual.

-- General comments

PostScript programs that are intended to be compatible with all PostScript printers should not make use of the new features. However, it is possible for a program to determine whether or not the new features are present and to invoke them conditionally. The descriptions below suggest how to determine whether a particular feature is present or not.

-- Packed array representation

PostScript procedures are represented as executable arrays which, until now, have been stored in the same fashion as literal data. The representation, while offering maximum flexibility, is very costly in space (8 bytes per element). Large PostScript programs, such as the built-in server program, and downloaded preambles, consume considerable amounts of Virtual Memory.

Since most programs do not require the ability to be treated as data but only the ability to be executed, a more compact representation has been introduced: the packed array. Programs represented by packed arrays are typically 50 to 75 percent smaller than the same programs represented as ordinary arrays.

The packed array object has a type different from an ordinary array object ('packedarraytype' versus 'arraytype'); but in most respects it behaves the same as an ordinary array.

The differences between a packed array and an ordinary array are:

1. Packed arrays are always read-only: you can't use 'put', 'putinterval', etc. to store into a packed array.
2. Packed arrays are created differently from ordinary array (see below).
3. Accessing arbitrary elements of a packed array can be quite slow; however, accessing the elements sequentially (as is done for the PostScript interpreter and by the 'forall' operator) is approximately as efficient as accessing an ordinary array.
4. The 'copy' operator cannot copy into a packed array since it is read-only; however, it can copy the value of a packed array to an ordinary array of at least the packed array's length.

To create packed arrays, you may employ two methods, the PostScript input scanner and the operator 'packedarray'. More commonly, the PostScript input scanner creates packed arrays automatically for all executable arrays that it reads. That is, whenever the scanner encounters a "{" while reading a file or string, the scanner accumulates all tokens up to the matching "}" and turns them into a packed array instead of an ordinary array. To build a packed array explicitly, invoke the 'packedarray' operator with a list of operands to be incorporated into the new packed array.

DOS 3.3: CHAIN

Revised: 11/20/84
Security: Everyone

DOS 3.3: CHAIN

=====

Your DOS master diskette contains a utility called CHAIN. Though described on page 106 of The DOS Manual, there are a few additional things to look out for.

CHAIN does an effective PR#0 and IN#0 when it is used, disabling an 80 column card or a High-Res character generator in the process. The first program can save four memory locations that, when the second program restores them, leave the input and output vectors unchanged.

```
63000  rem  prepare to chain
63010  J = peek (999) + peek (1000) * 256 - 110
63020  for K = 0 TO 3
63030  A(K) = peek (J+K)
63040  next K
63050  rem chain now

10 rem  Program 2 #2
20 for  K = 0 TO 3
30 poke J+K,A(K)
40 next K
50 rem  rest of the program
```

CHAIN overlays your existing Applesoft program with the new program. Watch out for your programs that use DEF FN and Onerr Goto statements. These statements must be re-executed in the new program if they are to work properly, because both statements contain pointers into the program text, which is different for each program.

DOS 3.3: RENUMBER and the MAXFILES command

Revised: 11/20/84
Security: Everyone

DOS 3.3: RENUMBER and the MAXFILES command

=====

Applesoft RENUMBER doesn't work with MAXFILES other than 3. RENUMBER is a machine language program loaded as an Applesoft program, when run, relocates the machine language up to HIMEM in your system. DOS defaults to MAXFILES 3, so HIMEM is on page boundary \$9600, in a 48K Apple. Changing MAXFILES moves HIMEM off this page boundary. RENUMBER's relocater still does the move, but it doesn't relocate the address properly. The usual result is that the system drops into the monitor in the address range of \$0200 - \$0300.

DOS 3.1, 3.2 and 3.2.1: APPEND

Revised: 11/20/84
Security: Everyone

DOS 3.1, 3.2 and 3.2.1: APPEND

=====

The APPEND command opens sequential files, then reads through all of the records until it finds the end. The next WRITE command is then appended to the end of the file. Unfortunately, there are some problems with APPEND:

When the last carriage return written out is the last byte in the last sector of the file, DOS doesn't allocate another sector for the end of file mark. Therefore, the next APPEND never finds the end of the file, and so the file pointer gets left at the beginning of the file. Consequentially, the next WRITE command writes over the first record.

Try a READ after the APPEND command:

- A. When the READ returns an "Out of Data" error, do a normal APPEND, assuming that you're using an ONERR GOTO in Applesoft.
- B. A successful READ means that APPEND writes over the file. In this case, the only way to add to the end of the file is to copy the entire file into another, then write your information into the new file. Delete the old file and rename the new file with the old file's name.

Tech Info Library

DOS 3.3: Disk layout

Revised: 4/8/91
Security: Everyone

DOS 3.3: Disk layout

=====

DOS reserves the first three tracks (0,1,2) of every disk for the boot image of itself, while track 17 (\$11) is reserved for the directory and VTOC. Tracks 1 and 2 can be freed by modifying the bit map in the VTOC; however, the disk won't be able to boot properly.

Expanded the directory by changing the link bytes in bytes 1 and 2 of the last sector of the directory.

The number of sectors required for a DOS file can be calculated:

$$\text{Sectors} = \text{length} / 256 + \text{length} / 256 / 122$$

The physical number of sectors required to hold the data is recorded in the first part of the expression. It's 2 bytes higher for a program and 4 bytes higher for a binary file. The second part contains the track/sector information, even when there is no data. Thus, the minimum number of sectors for a file is two.

Random access files, as are all files, are maintained through the track/sector list at the beginning of the file. DOS:

- * Locates the start of the record
- * Determines which sector that byte would be in, relative to the start of the file
- * Determines with the track/sector list in which sector the record is located
- * Calculates the offset into the sector
- * Writes data.

DOS allocates enough sectors in the track/sector list to access the required sector; however, DOS doesn't allocate any sectors when there hasn't been any data written to the records of that sector. Example:

```
10 D$ = chr$(4)
20 print D$;"open test, L500"
30 print D$;"write test, R65"
```

```
40 print "hello"  
50 print D$;"close test"
```

This program creates;

```
65 records * 500 bytes = 32500 bytes = 126 sectors
```

```
126 sectors = 2 track/sector list sectors
```

for a grand total of:

```
1 sector of data  
2 sectors of track/sector list
```

No data sectors are allocated for records 0 through 64.

Security: Everyone

LaserWriter 2.0 ROM: Parity & Hardware Handshaking Change (2/95)

Article Created: 4 September 1987
Article Reviewed/Updated: 23 February 1995

TOPIC -----

DISCUSSION -----

The LaserWriter's serial communication capability has been enhanced. The DTR flow control protocol has been introduced as an alternative to the XOn/XOff protocol.

DTR flow control makes use of a control signal, Data Terminal Ready, which is available through the DB-25 connector (but not through the DB-9 connector). Normally the LaserWriter leaves this signal turned on. However, when it needs to stop the flow of characters from the host, it turns DTR off. The host must immediately stop sending characters until the LaserWriter turns DTR back on again. Similarly, another signal, Data Set Ready, (DSR) may be used by the host to control the flow of data sent to it from the LaserWriter.

Failure of the host to conform to the selected flow control protocol may result in unexpected occurrences of 'ioerror', caused by overflow of the LaserWriter's input buffer. Note that only one flow control protocol can be used at a time, and for flow control to work correctly, the LaserWriter and the host must agree on which protocol is in use.

The parity parameter of 'setscbbatch' or 'setscinteractive' has been changed to an options parameter that encodes both the treatment of the parity bit (as before) and the choice between Xon/Xoff and DTR flow control. The values of the options parameter now have the following meanings:

Xon/Xoff Flow Control

- 0 Ignore parity: (RCV high order bit ignored, XMIT high order bit is zero).
- 1 Odd parity: (RCV checked for odd parity, XMIT each character has odd parity)
- 2 Even parity: like odd but for even parity.

3 No parity: all eight bits are data and no checking is performed.

DTR Flow Control

4 Ignore parity (see 0 above)

5 Odd parity (see 1 above)

6 Even parity (see 2 above)

7 No parity (see 3 above)

The 9 pin connector's signal pin assignments are unchanged from before.

The set of signals on the DB-25 have been slightly expanded as follows:

2 Transmit Data

3 Receive Data

4 Request to Send (RTS) (optional)

6 Data Set Ready (DSR) (optional)

7 Signal Ground

20 Data Terminal Ready (DTR) (optional)

A cable diagram for connecting a LaserWriter to an RS-232 port might look like this:

. RS-232 Port Pin -- Pin on LaserWriter

.	2	2
.	3	3
.	6	6
.	7	7
.	20	20

The optional signals need to be connected only if the host computer requires them. If DTR flow control is used, the DTR and DSR lines must be connected.

Availability of DTR flow control considerably simplifies use of the LaserWriter from some computer systems, including the IBM PC. To set up the IBM PC for communication with the LaserWriter over serial port 1 using DTR flow control, issue the commands:

```
MODE COM1:9600,n,8,1,p
```

```
MODE LPT1:COM1
```

To set up the LaserWriter, connect your serial cable from the LaserWriter to the RS-232 port, set the server mode switch on the LaserWriter to the '9600' position and send from the host computer to the LaserWriter the following PostScript Code:

Caution:

If you choose to use the PostScript code provided in this article, you assume all risks involved in making these changes. PostScript code, if not entered correctly, can place the LaserWriter into a condition requiring service.

%=====

```
% Begin PostScript Code
%
serverdict begin 0 exitserver
statusdict begin
25 9600 4 setsccbatch
end
%
% end PostScript Code
%=====
```

This changes the LaserWriter over to DTR flow control when executing in PostScript batch mode over the 25 pin connector. The LaserWriter will now be communicating with the RS-232 port using DTR (hardware) handshaking. This status is written into EEROM and will be permanent until changed.

To set up the LaserWriter to use DTR flow control during Diablo 630 emulation, send it the same program with 'setscinteractive' substituted for 'setscbatch'.

To change back to Xon/Xoff (software) handshaking, send this PostScript code to the printer:

```
%=====
% Begin PostScript Code
%
serverdict begin 0 exitserver
statusdict begin
25 9600 0 setsccbatch
end
%
% end PostScript Code
%=====
```

These programs need to be sent to the LaserWriter with the server mode switch set to '9600' even if setting up Diablo mode communications protocols. Once the handshake mode is changed, the user may then switch to Diablo mode (switch in 'Special') if desired.

Business BASIC III: Numerics

=====

Apple III Business BASIC uses the same floating point math package that Applesoft uses internally. However, Business BASIC only display a maximum of 6 decimal digits when it prints. This limitation was built in because the last three digits of Applesoft's math package develop errors that can seriously affect some applications.

Business BASIC III: RENUMBER -- Unreferenced Lines

=====

Business BASIC's RENUMBER program isn't able to properly renumber the sample program:

```
10 GOTO 20
```

Though it's obvious that GOTO 20 references a line that doesn't exist, it won't always be obvious in a large program. One way to check that there are no "phantom" line numbers is to use the XREF function in the RENUMBER program before you actually renumber your program.

Business BASIC III: IF...THEN...ELSE

Revised: 11/20/84
Security: Everyone

Business BASIC III: IF...THEN...ELSE

=====

The IF/THEN statement can give some unexpected results. The rules for IF/THEN are:

1. When the logical expression is true, the rest of the line is executed, except:
 - A. When there is an ELSE on the same program line, execution continues to the ELSE, then goes the next numbered program line.
 - B. If there is an implicit or implied GOTO, execution continues at the target line.
2. When the logical expression is false, execution continues on the next numbered program line, except:
 - A. When there is an ELSE on the line, execution continues after the ELSE.

The following examples might help explain some of these special cases:

Example 1:

```
10 if A = 0 then print "1" : print "2"  
20 print "line 20"
```

Assuming	A = 0	A <> 0
Results	1 2	line 20

If A equals 0, then the Print statements in line 10 are executed (rule 1).
If A doesn't equal 0, then line 20 is executed (rule 2).

Example 2:

```
10 if A = 0 then 500 : print "1" : print "2"  
20 print "line 20"
```

```
500 print "end"
```

Assuming	A = 0	A <> 0
Results	end	line 20 end

If A equals 0, the Print statements in line 10 are never executed; then execution transfers to line 500 (rule 1B). If A doesn't equal 0, then line 20 is executed (rule 2).

Example 3:

```
10 if A = 0 then print "1" : goto 500 : print "2"
20 print "line 20"
500 print "end"
```

Assuming	A = 0	A <> 0
Results	1 end	line 20 end

If A equals 0, then the first Print is executed, then the execution is transfer to line 500 (rule 1A). If A doesn't equal 0, then line 20 is executed (rule 2). The last Print statement in line 10 is never executed.

Example 4:

```
10 if A = 0 then print "1" : print "2" : else print "3" : print "4"
20 print "line 20"
```

Assuming	A = 0	A <> 0
Results	1 2 line 20	3 4 line 20

This is a classic example of how ELSE is used. Either execute Print 1 and 2 or execute Print 3 and 4 (rules 1A, 2A).

Example 5:

```
10 if A = 0 then 500 : print "1" : print "2" : else print "3"
20 print "line 20"
500 print "end"
```

Assuming	A = 0	A <> 0
Results	end	3 line 20 end

Print 1 and 2 in line 10 is never executed, because if A equals 0, then

execution transfers to line 500 (rule 1B). If A doesn't equal 0, then the statements after the ELSE is executed (rule 2A).

Example 6:

```
10 if A = 0 then print "1" : goto 500 : print "2" : else print "3"
20 print "line 20"
500 print "end"
```

Assuming	A = 0	A <> 0
Results	1 end	3 line 20 end

If A equals 0, then Print 1 is executed, then execution is transfer to line 500 (rule 1B). If A doesn't equal 0, then the statements after the ELSE is executed (rule 2A). Print 2 statement is never executed.

Business BASIC III: Errata for Reference Manual

=====

The following are errata for Business BASIC III manual # A3L0002/030-0122-00

Page iv...The correct page number for Chapter 6 is 159.

Page iv...The entries for appendices C and D are reversed. They should read:

C	Alphabetic list of reserved word	236
D	Variable maps	238

Page 27...The section on CTRL-5, -6, -7, -8, -9 should refer to page 139 of the Standard Device Drivers Manual.

Page 128...The information at the top of the page is missing periods. It should read:

```
)print using "+###.###"; 3.14159
+ 3.142
```

This spec, +###.##,

Page 151...The line at the top of the page should read:

```
DEF FN MODB(A)=int ((A - int (A / B) * B +.5)
```

Page 240...The information for Long integers is reversed. It should read:

Long integer	0	high byte
	7	low byte

Page 329...The example that starts "print1;Apple" should read:

```
print #1;"Apple"
```

Prints text characters on the graphics display, starting at the cursor position.

If you used:

```
open #1, ".Graphix"
```

to open the graphics driver. Cursor marks upper left corner of character's rectangular cell.

To send direct screen-control characters to the .Graphix driver:

```
print #1; chr$(19);chr$(13)
```

Page 322...KBD is described on page 121 instead of page 43.

LaserWriter 2.0 ROM: Performance Enhancements

Revised: 9/29/87
Security: Everyone

LaserWriter 2.0 ROM: Performance Enhancements

=====

This article last reviewed: 4 September 1987

The performance of the LaserWriter for many applications has been significantly improved in the new implementation of the LaserWriter software. The main areas of improvement are as follows:

-- PostScript interpreter

The PostScript interpreter is substantially (30 to 40 percent) faster than before. This improvement applies primarily to programs that are being interpreted from procedures already stored in VM; programs being interpreted from a file or string receive little benefit.

-- AppleTalk

Efficiency of AppleTalk communication has been improved by a buffer strategy that permits greater overlap between the work being performed on the LaserWriter and on the host. This is especially noticed when using Apple's Print Manager on the Macintosh, which sends relatively short (512 byte) blocks.

-- Throughput

Page throughput for many applications is significantly increased by a new printing strategy that permits imaging of a page to be overlapped with execution of the PostScript description for the next page. Formerly, page imaging and PostScript execution were performed serially; the imaging time (up to 6 seconds per page) was entirely wasted.

-- Compressed character mechanism

Page descriptions that print large characters may benefit from the compressed character mechanism. Large characters now are often obtained from the font cache, whereas formerly they were always produced by re-executing the character descriptions.

-- Font cashe

Characters may be retained in the font cache even after removal of the font definition from which they were generated. If the same font is later defined again, the cached characters will be found and used if they still exist. This depends on correct use of the UniqueID entry in the font definitions; see the discussion under 'Modifying and creating fonts' in the PostScript Language Tutorial and Cookbook.

-- Virtual memory

The total amount of virtual memory available is not exactly the same as in the original LaserWriter, although it is close to being the same. This may affect the maximum number of down-loaded and user defined fonts that can be present simultaneously. Note that PostScript page descriptions with large preambles can obtain significant VM space savings by making use of the packed array facility.

Business Graphics III: HP Plotters

=====

Business Graphics III includes a set of drivers for different graphic plotters, one of which is the HP 7225A plotter. HP has since changed their product; the 7225A Plotter has been replaced by the HP 7470A plotter. To connect this new plotter to the Business Graphics III:

- a. Use the Apple Modem Eliminator Cable (A3M0019) along with the cable supplied with the plotter (AMP 07470-60090).
- b. Set the .printer driver to 1200 baud and one (1) stop-bit.
- c. Set the plotter's switches as follows:

S2	S1	Y	US	B4	B3	B2	B1
0	1	0	0	0	1	1	1

- d. Enter the command SET DEVICE HP 7225A to initialize the plotter from Business Graphics.

Parallel Interface Card: Initializing with POKEs (11/96)

Revised: 11/21/96
Security: Everyone

Parallel Interface Card: Initializing with POKEs (11/96)

Article Created: 21 September 1984
Article Reviewed/Updated: 19 November 1996

TOPIC -----

This article explains how to use POKEs to control the Parallel Interface card.

DISCUSSION -----

Neither PR# nor IN# commands in Applesoft and Integer Basic initialize the Parallel Interface. This situation can cause problems if you need to modify the parameters of the interface for your application.

The ROM on the Parallel Interface card, upon receiving the first character, sets all parameters to their default settings. After you POKE the parameter you want, the first character you send causes the ROM to overwrite all the parameter locations you have set up.

To correct this, send a character through the card and then change the parameter locations by means of the following POKEs. (Please refer to the Parallel Interface Card manual for additional information about what each POKE does.)

Replace all occurrences of "s" in the BASIC program below with the number of the slot the Parallel Interface Card is plugged into.

```
10 POKE 1400+s,80      carriage width
20 POKE 1656+s,0       character counter
30 POKE 1784+s,137     set command prefix to CTRL-I
40 POKE 1912+s,0       no video, no linefeed
    or                ,1      no video, enable linefeed
    or                ,128    enable video, no linefeed
    or                ,129    enable video, enable linefeed
```

The next list of POKEs replace the PR# and IN# commands and they must be used to benefit from the previous POKEs. Use "Call 1002" to execute DOS commands while the interface is enabled. However, if speed is of the essence, use the "Call

1002" after the data transfer has been made since DOS slows down I/O. All of these POKEs must be on one command line separated by colons to work in command mode; in a program, they may have separate line numbers.

```
50 POKE 54,2          PR#s
60 POKE 55,192+s
70 Call 1002
```

The normal way to reset the I/O back to the Apple video and keyboard is:

```
900 D$ = CHR$ (4): Rem CTRL-D
910 Print D$;"PR#0"
920 Print D$;"IN#0"
```

This only works after a Print and it is ignored after a Get or Print terminated with a comma or semicolon.

To avoid entering an extra Print statement, you can use the following:

```
900 Call -375 : Rem this is IN#0
910 Call -365 : Rem this is PR#0
920 Call 1002 : Rem this reconnects DOS
```

The Parallel Printer Interface Card can echo characters to the Apple's video output, disable the video out while printing lines more than 40 characters long. Please refer to the Parallel Printer Interface manual for more information on what each POKE does.

Security: Everyone

LaserWriter 2.0 ROM: General description of revisions (9/94)

=====

Article Created: 4 September 1987
Article Reviewed/Updated: 8 September 1994

TOPIC -----

LaserWriter Revision 2 and LaserWriter Plus are enhanced versions of the original LaserWriter printer. The original LaserWriter is fully described in Appendix D of the PostScript Language Reference Manual (copyright 1985, Adobe Systems, Inc., Addison-Wesley Publishing Co., ISBN 0-201-10179-3) so only the differences between the old and the new software will be described here.

DISCUSSION -----

A LaserWriter containing the new software can be identified in several ways:

The test page printed at power on time includes the LaserWriter revision number in the lower left corner of the line graph illustration; for the new software, this revision number is '2.0'.

A revision entry in statusdict contains the integer '2' identifying the new revision of the LaserWriter software. A PostScript program can read this value.

The version entry in 'systemdict' contains the string '37.0' or '38.0', identifying the PostScript interpreter included in the new software.

The product entry in 'statusdict' contains the string 'LaserWriter' for a LaserWriter with the standard 13 fonts, or 'LaserWriter Plus' for a LaserWriter Plus with its expanded set of 35 fonts. Note that a program is better advised to determine the selection of available fonts by enumerating the FontDictionary dictionary.

The enhancements introduced in the new software fall into three categories, LaserWriter-specific functions, improvements in software implementation, and PostScript language changes.

1. LaserWriter-specific functional changes. There include expanded communications options, additional paper tray selections, new fonts, and various other features present in revision 2 LaserWriter and not necessarily present in other PostScript printers.
2. Improvements in implementation. Nearly all the problems present in the original LaserWriter software have been corrected, and a number of operations have been made significantly faster.
3. PostScript language changes. Several new operations and capabilities have been introduced into the standard PostScript language and are being incorporated into all PostScript printers.

Installation of the new LaserWriter or LaserWriter Plus ROM software in an existing LaserWriter causes the page count to be reset to zero and all system parameters to revert to their default values.

Linking from PILOT to Pascal

Revised: 11/30/84
Security: Everyone

Linking from PILOT to Pascal

=====

Use the LP (LINK TO PASCAL) command to exit PILOT and enter Pascal. If you are in a PILOT lesson and wish to use a Pascal program, insert the following command into your lesson. For this example, the Pascal program is named MyProg.code.

```
LP:MyProg
```

Don't enter the ".code" suffix on the file name, since PILOT automatically adds it.

Use Pascal version 1.0 to compile your Pascal program, but link it to the system.library file provided on the PILOT Lesson1: Student Diskette. The "\$U name" compiler option allows you to do this.

After executing the LP command, the PILOT interpreter no longer has control. LP closes any open PILOT data files, and erases from memory the status and locations of PILOT variables.

When the Pascal program ends, the system reboots your PILOT "Hello" lesson. To return to a specific spot in your PILOT lesson, have your PILOT program "leave a trail". The following example instructs PILOT to return to the label "bolts" in the lesson "Mechanics":

```
D:N$(50)
T:going off to Pascal...
```

```
R:Open file "restart"
C:N$="restart"
FOX:1,N$
```

```
R:leave a trail in the form of the
R:appropriate L: command
C:N$="L:Mechnaics,bolts"
FO:1,N$
```

```
R go off to Pascal file MyProg.code
```

LP:MyProg

The Hello lesson on the PILOT disk looks for the restart file, as follows:

D:N\$(50)

C:N\$="restart"

FIX:1,N\$

R: If error flag is raised, the restart file

R: does not exist, so link to the normal first lesson

LE:firstlesson

R: Otherwise, read in the record containing our

R: restart lesson and label, and link there.

FI:1,N\$

XI:N\$

PILOT: Controlling Memory Mapped I/O

Revised: 11/30/84
Security: Everyone

PILOT: Controlling Memory Mapped I/O

=====

Many Apple II-compatible I/O devices are memory mapped; therefore, you can control them using Apple PILOT. The PILOT system variable %M is actually a memory map controlled by a subscript. The value of this subscript defines the location in the I/O device control space addressed by %M.

The I/O locations begin with address C080 (hex). This constant offset is added automatically to all %M locations. Variables %M(16) thru %M(127) address the device control space of slots 1 thru 7; access to slot 0 is not permitted. Variables %M(128) thru %M(1919) refer to the I/O select space of slots 1 thru 7. This space is typically used for ROM memory, but can be used in some cases for auxiliary device control information. For example, the PILOT command:

```
C: %M(16) = 0
```

POKEs a zero into I/O location 16, which is the first available byte (relative location zero) in the device select space of slot 1. Similarly, the command:

```
C: X = %M(20)
```

PEEKs into location 20 (relative location 4 in slot 1); it returns the result in variable X.

Generally variable %M may be used wherever the system variable %A is legal. It cannot be used to manipulate program memory from within PILOT lessons, but does provide some control of external devices.

The %M variable is a very powerful construct--I/O devices can be damaged by indiscriminate PEEKing and POKEing. Particularly avoid trying to manipulate any of the device controls for slot 6 where the disk controller is typically located. It is entirely possible to erase entire tracks of on your PILOT diskettes.

How to read Apple PILOT data files from Pascal

Revised: 11/30/84
Security: Everyone

How to read Apple PILOT data files from Pascal

=====

Though it may appear that data files are randomly accessible text files, they are actually block structured files, two strings long, with 255 per block. Records 0 and 1 are contained in relative block zero, 2 and 3 are in block 1, etc. The Pascal construct which defines this file format is:

```
VAR PILOTFILE: FILE OF STRING [255];
```

The data record associated with this file has the description PILOTFILE^, with a string of length 255. This file may be sequentially or randomly accessed using the commands Get, Put and Seek. See the Pascal Language Reference manual for details.

To open an existing file, use the Reset command; a new data file may be created using Rewrite. These commands are the same as the PILOT commands Fix and Fox respectively. Always Close a new file using the Lock option to record the data file in the diskette directory.

PASCALPGM Links to the Pascal program contained in the file PASCALPGM.code. Compile any intrinsic library units this program requires with the libraries found on your Apple PILOT Author Diskette or Lesson Diskette using the Pascal 1.0 compiler. The Apple PILOT system uses a special 48K run-only version of Pascal 1.0, which requires different intrinsics due to its unique storage allocation.

The linkage from PILOT to Pascal is one-way: data cannot be transmitted from PILOT to Pascal, except by data files on diskette. When the Pascal program ends, the PILOT lesson diskette reboots automatically and begins executing the Hello program if any. Programs running in this environment have approximately 10K less user storage space than in the standard Pascal system.

The first compiled procedure in the outer block of any Pascal program running under the PILOT system should be:

```
Procedure Syserror;  
Begin  
End;
```

System errors automatically divert control to this procedure, with IOResult set to the corresponding error number. The default action is:

- A. If the error is non-fatal, execution of the procedure currently executed is aborted. Execution of its calling procedure is resumed.
- B. When the error is fatal, the program terminates with an appropriate error message. Any additional error checking or recovery should be done in this procedure.

The following example prints the contents of any Apple PILOT data file:

```
Program Datalist;

Var PILOTFILE: file of string [255];
    Filename: string;
    RECNO: integer;

Procedure Syserror;
Begin
End;

Procedure Pause;
Begin
    Writeln;
    Write ('Press RETURN to continue...');
    Readln;
    Writeln
End;

Begin
    Page (output);
    Write ('List which data file? ');
    Readln (Filename);
    Writeln;
    Filename := CONCAT (Filename, '.data');
    RESET (PILOTFILE, Filename);
    RECNO := 0;
    While not EOF (PILOTFILE) Do Begin
        Writeln ('Record ', RECNO, ': ', PILOTFILE^);
        Get (PILOTFILE);
        RECNO := RECNO + 1;
        If RECNO MOD 20 = 0 Then PAUSE
    End;
    Writeln;
    Writeln ('End of file: ', RECNO, ' records listed.');
```

Pause

End.

LaserWriter: How to Change Page Types

Revised: 9/29/87
Security: Everyone

LaserWriter: How to Change Page Types

=====

This article last reviewed: 4 September 1987

The selection of built-in 'page types' has been enlarged to include two European sizes. The height of the letter and legal page sizes has been slightly decreased because of memory constraints in the new software. Finally, the function of the 'note' page type has been generalized.

The LaserWriter includes built-in device setup procedures for establishing any of seven standard page types:

1. letter
2. legal
3. A4
4. B5
5. lettersmall

'Lettersmall' is an imageable region 7.68 by 10.16 inches centered on an 85. by 11 inch page.

6. A4small
7. note

'Note' selects one of the above page types according to the paper tray that is installed. If the letter or A4 tray is installed, 'note' selects 'lettersmall' or 'A4small' respectively. If the legal or B5 tray is installed, 'note' selects 'legal' or 'B5'. For the letter or A4 paper sizes, this has the effect of increasing all four margins to approximately 0.42 inch. The reduction in the imageable area frees up as much as 100,000 bytes of memory, which is added to the VM (Virtual Memory) and made available for PostScript

programs.

Page 121 of the LaserWriter and LaserWriter Plus manual (copyright 1986, Apple Computer, Inc., manual number: 030-1296-B) describes the letter, legal, A4 and B5 pages sizes.

Programmer's Aid #1: Problems with the memory test

=====

The memory test in the Programmer's Aid #1 diskette has a problem. According to the listing on page 86 of the manual, \$D670 contains 20 8A D6 when the ROM contains 4C CB 02. This causes the program to jump to \$02CB where there normally isn't any program. To patch around this problem, enter these instructions in the monitor before testing any memory:

02CB:20 8A D6 4C 73 D6

Programmer's Aid #1: Memory test and DOS

=====

Disable DOS before attempting to test the memory locations used by DOS. All input from the keyboard displayed on your screen goes through DOS; therefore, DOS is erased during the memory test, which causes your system to hang. To disable DOS, type from the monitor:

FE89G
FE93G

QuickFile III: String overflow error

=====

When you try to save your file, QuickFile III prompts you for the date for the catalog. If you type in eight or more characters, which is more than QuickFile can convert to a valid date, the program stops with a String Overflow error and loses all the data you just typed in.

To avoid this error, verify that the date you typed in is correct before pressing RETURN. Examples of what QuickFile considers to be valid dates are listed on page 41 of the QuickFile Manual.

Silentype and the TAB command

Revised: 7/30/87
Security: Everyone

Silentype and the TAB command

=====

TABs do not work properly with the Silentype. From Integer BASIC, the tab is limited to the first 40 columns, while an Applesoft TAB(20) occassionally outputs 20 spaces instead of going to column 20. Use POKE 36,T instead of TAB(T) (where T is the tab value) with either BASIC.

```
Print "first item";: POKE 36,45: Print "second item"
```

Output:

```
first item                second item
```

Macintosh Plus: Serial Driver Differences Of The 128K ROM

=====

Article Created: 18 September 1987
Article Last Reviewed: 31 October 1991
Article Last Updated: 31 October 1991

TOPIC -----

This article describes issues with RAM and ROM based serial drivers when the Macintosh Plus was introduced.

DISCUSSION -----

When connected to third party printers, the newer ROM-based Macintosh Plus serial driver occasionally doesn't work, possibly because of differences between the old RAM and ROM drivers and the newer ROM driver.

If you have recently upgraded your system to a Macintosh Plus and your printer no longer works with some of your applications, you may have to change from Xon/Xoff (Software) to DTR (hardware) type handshaking, if your printer has this option.

There were originally three different serial drivers, two RAM serial drivers and a ROM serial driver. The RAM drivers had features that the ROM driver didn't. One version of the RAM driver was for use with the 128K and 512K Macintosh and one version was for use with the Macintosh XL. All serial drivers default to 9600 baud, 8 bits data, no parity, and two stop bits with the ROM serial driver supporting CTS hardware handshake and the RAM driver supporting Xon/Xoff software handshake. The ROM driver would terminate input requests when an error occurred. The RAM driver would not terminate with errors. It can be seen that, depending on which driver was used by an application, a user could access certain built-in functions.

The newer serial driver in the Macintosh Plus 128K ROM has some differences from all the previous drivers. The new driver verifies that the serial port is correctly configured and free; if not, an error is returned. When opened, the new driver defaults to hardware handshake ON (as did the old ROM driver). When

opened, the new driver also asserts the DTR line and negates that line when closed. There have been new control calls implemented that let the application control the input data flow from an external device, as well as set control options, and modify the translation of parity default characters.

Further information on the old RAM and ROM serial drivers can be obtained from Inside Macintosh Vol. II, Page 245-255. Further information on the newer ROM serial driver can be obtained from Inside Macintosh Vol. IV, Page 225-228.

Apple II Memory Expansion Card: Using it on the Apple IIGS

=====

This article last reviewed: 14 September 1987

The Apple II Memory Expansion Card does not function as Apple IIGS RAM. The card appears as a volume on your desktop; the volume name refers to the slot the card's in e.g., slot four = '/RAM4'. You should be able to format and rename as well as write to the memory card as a standard ProDOS volume.

To increase performance, the Apple IIGS's DeskTop program does recognize the Apple II Memory Expansion card and loads itself into the RAM card.

Softcard III: Diskette compatibility with Apple II CP/M

=====

The diskette organization used in the Apple II Softcard CP/M and the Apple III Softcard CP/M are identical. This means that files generated on either system is readable by the other. However, the Softcard III CP/M System File does not work correctly on an Apple II, and visa-versa.

Some programs were designed with specific hardware in mind and may not work correctly on the Apple III. Several examples are MBASIC, GBASIC, and FORTRAN supplied by Microsoft.

Softcard III: Accessing Apple III system clock under CP/M

=====

The Apple III clock is accessible from machine language under CP/M. There are two call addresses in BIOS used to read and set the clock. Both use a common 18 byte area for returning the Date/Time or for setting the clock. If no clock is installed, the byte at 0DFE0H is 00H.

To Set Clock: Call 0DF89H

To Read Clock: Call 0DF86H

Example: Friday, March 21, 1982, 1:27 PM and 41.234 seconds is represented as the ASCII string: "198203216132741234".

	Addresses	Contents	
		Hex	ASCII

Softcard III: Selecting 40-Column and 80-Column Text Modes

Revised: 11/30/84
Security: Everyone

Softcard III: Selecting 40-Column and 80-Column Text Modes

=====

There are several ways to switch to either 40 or 80 column mode in the CP/M environment. One way is to write a short assembly language program, assemble it, then load it as a .COM file. Another way is to use the BASIC's CHR\$ functions to change modes. Don't forget to reset the viewport when changing to 80 column mode. Refer to the Standard Device Drivers Manual for further information.

Below are two assembly language programs which allows you to set 40 or 80 column modes from the CP/M command level. Enter these in your ED.COM editor, then assembled them using ASM.COM. Once assembled, load them into .COM files using the Load utility on the CP/M System Disk.

```
;
;      Forty.COM
;
BDOS    EQU    0005H    ; BDOS entry point
WARM    EQU    0000H    ; Warm start entry point
PRINT   EQU    9        ; Print string command
;
;      ORG      0100H    ; Beginning of TPA
;
;      LXI      D,CMDS   ; Point to command string
;      MVI      C,PRINT  ; Set-up BDOS command
;      CALL     BDOS     ; Call BDOS to print string
;      JMP      WARM     ; Warm start return to CP/M
;
CMDS:   DB      16       ; Set text mode
;      DB      1        ; To 40 column mode
;      DB      28       ; Clear viewport command
;      DB      '$'      ; End print string command
;
;      End
;
;      Eighty.COM
;
```

```
BDOS    EQU    0005H    ; BDOS entry point
WARM    EQU    0000H    ; Warm start entry point
PRINT   EQU    9        ; Print string command
;
        ORG     0100H    ; Beginning of TPA
;
        LXI     D,CMD$   ; Point to command string
        MVI     C,PRINT  ; Set-up BDOS command
        CALL    BDOS     ; Call BDOS to print string
        JMP     WARM      ; Warm start return to CP/M
;
CMD$:    DB      16       ; Set text mode
        DB      2        ; To 80 column mode
        DB      1        ; Reset viewport
        DB      28       ; Clear viewport command
        DB      '$'      ; End print string command
;
        End
```

From Microsoft BASIC, use:

A. To switch to 40 Column mode:

```
100 Print CHR$(16) + CHR$(1) + CHR$(28)
110 End
```

B. To switch to 80 Column mode:

```
100 Print CHR$(16) + CHR$(2) + CHR$(1) + CHR$(28)
110 End
```

Softcard III: Problems using .RS232, .PRINTER and CP/M

=====

Both the .RS232 and .PRINTER drivers were designed to use the built in serial port (Port C) on the Apple III. If one configures the CP/M system such that both of these drivers are active and assigned to logical devices, the first attempt to send or receive characters causes the system to crash with an inverse S D (System Death) displayed on the console. Reboot your system to recover.

Super Serial Card: Manual Errata (12/96)

=====

Article Created: 21 September 1984
Article Reviewed/Updated: 16 December 1996

TOPIC -----

Listed below are corrections to the Super Serial Card Owner's manual.

DISCUSSION -----

Page 5

The second paragraph under "Preparing the SSC for Printer Mode" should read:

If the triangle on the jumper is pointing toward the word "Modem", remove the block, using an IC Extractor if necessary, then carefully reinsert it so the triangle is pointing towards the word "Terminal".

Page 13

The example for Applesoft BASIC should read:

Applesoft BASIC: Print CHR\$(9); "command"

Page 21

The second paragraph under "Preparing the SSC for Communication Mode" should read:

If the triangle on the jumper is pointing down toward the word "Terminal", remove the block, using an IC Extractor if necessary, then carefully reinsert it so the triangle is pointing toward the word "Modem".

Page 36

The last two lines of the paragraph titled "A Terminal Mode Example" should read:

"...BASIC program to an Applesoft program, substitute CHR\$(4) for D\$, and CHR\$(1) for A\$. Leave out program lines 40 and 42."

Page 54

In the section that starts "\$C08A+s0 Command", bit 1 of the Command Register should be set to 0 to enable the receiver to cause interrupts.

Apple IIGS: VCR Connection

Revised: 6/1/89
Security: Everyone

Apple IIGS: VCR Connection

=====

This article last reviewed: 09 December 1988

Here's how and why to connect your Apple IIGS to a VCR.

How: use a normal Apple IIGS video cable to connect the Apple IIGS's video output to the VCR's camera input. (Video cables are available in several lengths.) Set the VCR to "camera."

Why: This arrangement lets you use the television that's connected to the VCR as a computer monitor -- and you don't have to use an RF modulator. Because the VCR thinks the computer is a camera, you can save whatever the computer displays on video tape. Use a drawing program, for example, to make title screens for your live-action videos, or use an animation program to make your own cartoon videos.

Pascal III: Comparison to Apple II Pascal (1 of 2)

Revised: 11/30/84
Security: Everyone

Pascal III: Comparison to Apple II Pascal (1 of 2)

=====

The majority of Apple II Pascal programs can be recompiled then executed on the Apple III without modification. The following is summary of significant differences between Pascal II and Pascal III. Please refer to the Apple III Pascal Programmer's Manual, Volume 2, starting on page 128, for additional information.

OTHERWISE Clause in CASE Statement:

Pascal III provides an OTHERWISE clause in the CASE statement. The OTHERWISE clause allows you to enter a statement that is executed if none of the cases are executed. Refer to chapter 5 of the Apple III Pascal Programmer's Manual.

SOS Pathnames:

SOS Pathnames are different from the Pascal filenames used on the Apple II. Pascal III supports both types of names, as explained in the Apple III Pascal Introduction, Filer, and Editor manual.

SOS Device Driver Support:

Pascal III supports SOS device drivers as "I/O units." See Chapters 10 thru 12 in the Standard Device Drivers Handbook.

Graphics:

The Apple III screen graphics modes driven through the SOS graphics driver differs significantly from the Apple II. Therefore, a new unit named PGRAF is supplied as a high-level interface to the graphics driver. Refer to the Standard Device Driver manual for additional information on the SOS graphics driver.

Turtlegraphics is available only for compatibility with the Apple II. Refer to Appendix K of the Apple III Pascal Programmer's Manual.

New Procedures:

The AppleStuff unit contains Date, TimeOfDay, ClockInfo, and SetTime procedures for reading and setting the Apple III system's internal date and time. See Appendix D of the Apple III Pascal Programmer's Manual.

New Data Types:

The ByteStream and WordStream types are provided for use as types of Var parameters in procedure and function definitions. See Chapter 3 of the Apple III Pascal Programmer's Manual.

Real Arithmetic:

For operations on type Real values, Pascal III conforms to the IEEE floating-point standard. Under default conditions, the difference between the Pascal III and Apple II Pascal is invisible, unless the program performs operations giving exceptional results, such as division by zero. See Appendix F of the Apple III Pascal Programmer's Manual for complete details.

The Apple Pascal Numeric SANE package, available for both the Apple II and Apple III, establishes a universal mathematic environment for the two systems.

Library Files and Units:

Each Pascal III codefile can have a "program library" file associated with it in addition to the System.Library file. Thus, library units are more convenient; furthermore, programs may have up to 48 segments at run time.

When compiling a unit, it is no longer necessary in all cases to use the Compiler's swapping option.

Pascal III: Comparison to Apple II Pascal (2 of 2)

Revised: 11/30/84
Security: Everyone

Pascal III: Comparison to Apple II Pascal (2 of 2)

=====

Memory Organization:

An Apple III operating SOS or Pascal has different memory organization than when running Apple II Pascal. The amount of memory available is somewhat greater on the 128K Apple III than on the Apple II.

Memory organization could effect an Apple II program run on a Apple III, if the program depends on pointer values created when running on an Apple II and stored on a diskette.

Similarly, an Apple II program that depends on specific Apple II hardware addresses does not work on the Apple III. This could for example affect Apple II Pascal programs designed to drive the Silentype printer; though such programs could be revised to use the Apple III Silentype driver described in the Standard Device Drivers Handbook.

The UNITSTATUS Procedure:

The UNITSTATUS procedure is supported for device oriented I/O. See Chapter 12 of the Apple III Pascal Programmer's Manual.

Runtime Segment Table:

The runtime segment table allows for 64 segments instead of 32. See Chapter 15 of the Apple III Pascal Programmer's Manual.

Conditional Compiling:

The Apple III Pascal Compiler allows conditional compilation. See Appendix F of the Apple III Pascal Programmer's Manual.

CHAINSTUFF Unit:

Since Apple III Pascal has no "system swapping" mode, the SWAPON and SWAPOFF procedures are absent from the CHAINSTUFF unit.

Compiling Apple II Code:

The Pascal III compiler can compile code to run on the Apple II. Refer to Appendix F of the Apple III Pascal Programmer's Manual.

File Variable Size:

Every declared file in an active procedure requires 1,100 bytes of memory.

Compiler Options:

Option names can be spelled out.

Because Compiler options always end with a comma, all can be chained together except for the Include option. The Comment option cannot contain a comma and the Resident option does not accept a list.

Procedure Complexity:

The Apple III larger memory supports more complex code than the Apple II.

System Globals:

Users of the {\$USER-} option may find that their programs are not portable.

Pascal III: Error code summary

Revised: 11/30/84
Security: Everyone

Pascal III: Error code summary

=====

System Failures

01	Re-entrant system call
02	Interrupt not found
03	Too many nested interrupts
04	Unable to allocate NMI
05	Event queue overflow
06	Stack overflow
07	Invalid request code
08	Reserved
09	Memory size less than 64K bytes
0A	Invalid volume control block
0B	Invalid file control block
0C	Invalid allocation block
0D	Pathname buffer overflow
0E	
0F	Invalid buffer number
10	Invalid buffer request

Pascal Execution Errors

1	Value range error
2	No procedure in segment table
3	Exit from uncalled procedure
4	Stack overflow
5	Integer overflow
6	Divide by zero
7	NIL pointer reference
8	Program interrupted by user
9	System I/O error
10	User I/O error
11	Unimplemented instruction
12	Floating point error
13	String overflow
14	Program HALT
15	Programmed break-point

Pascal I/O Errors

0	No error, normal I/O completion
1	
2	Bad unit number
3	Illegal operation (e.g. read from Printer:)
4	
5	Lost unit, no longer on line
6	Lost file, file no longer in directory
7	Illegal pathname
8	No room, insufficient space on diskette
9	No unit, unit not on line
10	No such file in specified directory
11	Duplicate pathname
12	Attempt to open an already open file
13	Attempt to access a closed file
14	Bad input format, error in reading number
15	Ring buffer overflow, input arriving too fast
16	Write protect error, diskette is protected
17	
18	
19	Too many files open for system to handle
20..31	
32	(SOS) Invalid request code
33	
34	(SOS) Invalid control parameter list
35	(SOS) Character device not open
36	(SOS) Device not available
37	(SOS) Resource not available
38..43	
44	(SOS) Invalid byte count
45	(SOS) Invalid block number
46..47	
48..63	(SOS) Device specific error
64	(SOS) Device error, bad address or bad data on diskette
65	(SOS) Too many character files open
66	(SOS) Too many block files open
67	(SOS) Invalid file reference number
68..72	
73	(SOS) Directory full
74	(SOS) Incompatible file format
75	(SOS) Unsupported storage type
76	(SOS) Attempted read past end of file
77	(SOS) File position out of range
78	(SOS) Illegal access attempted
79	(SOS) User's buffer too small
80	(SOS) File busy
81	(SOS) Volume format neither SOS nor Apple II
82	
83	(SOS) Invalid value in list parameter
84	(SOS) Out of memory for SOS system buffer

85	(SOS) Buffer table full
86	(SOS) Invalid system buffer parameter
87	(SOS) Duplicate volume error
88..126	
123..127	(SOS) System call error

Pascal III Editor: Inserting control characters

=====

The Pascal Editor recognizes 32 different control characters. The trick to producing them is to press the OPEN-APPLE key together with whatever key is required to obtain the desired control character, as described in the table on p. 136 of the Standard Drivers Manual. These characters go into the file with their high bit set to one, but that probably won't be a problem: most programs and peripherals ignore the high bit anyway.

Macintosh: Key Caps desk accessory

=====
Article Created: 17 December 1984
Article Last Reviewed: 29 May 1992
Article Last Updated: 29 May 1992

The Key Caps desk accessory is used to show the current keyboard mapping - that is, which keys correspond to which characters. It is especially useful for showing the characters accessed by the Option key, which are not typically displayed on the keyboard itself. The Key Caps menu, available when the DA is open, allows you to select and view any font available in your system. Key Caps can also be used to "type" characters into the Key Caps desk accessory using the mouse to click on letters. The characters can then be copied and pasted into another application if your keyboard is broken or inaccessible.

To print the Key Caps layout take a snapshot of the screen and print it. Search on "Screen Dump" for more information. It's not possible to screen dump the keys displayed on the Key Caps screen when the option key is pressed down. If you want a printout of the characters produced when pressing the option key, type them into an application, such as MacWrite or MacPaint, then print using the print dialog box.

To display all the characters in a given font, use ResEdit or the simple MS-BASIC program below.

```
10 c = 32
15 l = 0
20 Print CHR$(c);
25 c = c +1
30 l = l +1
35 If c > 255 Then End
40 If l < 50 Then 20
45 Print
50 Goto 15
```

This program prints the default (Geneva 12-point) key caps to the default screen. Add the following lines to your program to print other fonts and sizes

contained on the BASIC disk:

5 CALL TEXTFONT (typeface)
--0 is system font, 2 is New York, etc.; refer to the Microsoft BASIC manual.

7 CALL TEXT SIZE (size)
--9, 12, 14 or whatever sizes are on the disk.

Pascal III: Listing large directories

Revised: 4/8/91
Security: Everyone

Pascal III: Listing large directories

=====

The Pascal III Filer reads the entire directory into memory before printing any of it, and so the number of files in a directory is limited. With a 128K Apple III, this limit is approximately 500 files; a ProFile with a directory containing more than 500 files, then, can cause problems.

SOS was designed to accomodate subdirectories so that large numbers of files can be stored and used with ease. A complex daily log of transactions, for instance, might be arranged like this:

This way, the pathname to the data for the last day of Feburary would be:

/PROFILE/TRANSTIONS.82/FEBURARY/D28

By making use of SOS's ability to accomodate subdirectories, then, you can store far more than 500 files, as long as you never exceed the 500-file limit within any single directory.

Pascal III: SEEK

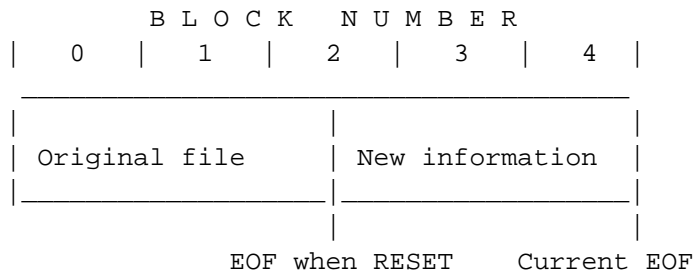

Revised: 11/30/84
Security: Everyone

Pascal III: SEEK

=====

SEEK has a problem when used with an Apple II Pascal formatted diskette. When SEEKing a record that has been added to the file since the last RESET, it either takes a long time to find the record, or else Pascal stops with a System Failure error.

This commonly happens when you increase a file's size with PUTs and then use a SEEK to access one of the new records. Further operations on the file may destroy it.

For example: a SEEK to a record in the last half of block 2, block 3 or 4 causes undesirable results.

If you must extend a file, RESET the file before using SEEK.

Pascal III: Accessing the extra memory (1 of 5)

Revised: 11/30/84
Security: Everyone

Pascal III: Accessing the extra memory (1 of 5)

=====

Apple III Pascal is upwardly compatible from Apple II Pascal. One of the constraints this imposed on the design of Pascal III was the restriction of the data space to 64K bytes. This restriction has been made clear on all specifications of the product. However, since the system uses additional space for SOS, drivers, graphics, the interpreter and code segments, this restriction may still interfere with programs that use large quantities of data.

To illustrate the steps involved in accessing more data, below are some small assembly routines. They ask SOS to allocate more space for the program, allow transfers of data back and forth to that space, then deallocate the space. On top of that is built a simple string package which stores up to 128K of string values in this space. Though the memory within this space may be managed only in the simplest of ways, the space can still be very useful.

The routines consists of three portions:

- A. An assembly language routine containing macros that the SOS interface needs.
- B. A fancy version of MOVELEFT that moves bytes from one location in banked memory to another. It understands the memory addressing of the Apple III, and so it increments pages accordingly.
- C. A Pascal unit that uses the first two programs to implement the string routines.

=====
; This file contains an assembly language procedure which moves
; bytes from one bank to another.  Use this from Pascal to get
; access to the rest of the bank space in larger machines.
; This can allow you to do SOS Request-Seg calls and use
; that area for data storage for later use or to pass to an
; assembly procedure. This procedure does two slightly difficult
; things :
;
; 1. it avoids holes in bank memory map, and
; 2. it switches banks on both source and destination at the
;    right times.
;
; Pascal declaration is:
;   PROCEDURE FetchBytes(SrcBank:INTEGER;    Source:INTEGER;
;   ;                               DstBank:INTEGER;    Dest:INTEGER;
;   ;                               PageCount:INTEGER;    Count:INTEGER
;   ;                               ); EXTERNAL;
;
; The procedure will copy 256*PageCount+Count bytes from
; Source (a bank pointer to bank pair starting with SrcBank) to

```

```
; Dest (a bank pointer to bank pair starting with DstBank);
; A SrcBank or DstBank of -1 means "in Pascal's bank pair"
; Thus FetchBytes(-1,Atsign(S),-1,Atsign(D),0,C) ==
;   MoveLeft(S,D,C)
;
; RESTRICTIONS:
;   1. Equivalent to a moveleft (ascending transfer)
;   2. Cannot reach top and bottom (system) banks,
;       and "real" addresses must be offset
;       by $2000 to render bank addresses
;
; ALGORITHM:
;   1.   If we're moving  X*65535 +Y*256 + Z bytes, then
;   2.   First move Y pages to clear middle byte of Count
;   3.   Then use middle byte to move X*256 pages,
;   4.   Finally, move Z bytes in last page.
; =====

Pascal III: Typeahead Killer

=====

The following program demonstrates how to control the typeahead feature of the .CONSOLE driver. The Standard Drivers Manual and the Pascal Programmer's Manual explain how it works.

```
PROGRAM KILL_TYPEAHEAD;

VAR CH:          CHAR;
    COMMAND:     INTEGER;

BEGIN
    WRITE (CHR (28)); GOTOXY (0,12);
    WRITE ('Typeahead: K)ill, R)estore, A)bort: ');
    REPEAT
        READ (KEYBOARD, CH);
    UNTIL CH IN ['K', 'k', 'R', 'r', 'A', 'a'];
    GOTOXY (0,12);
    CASE CH OF
        'K', 'k': BEGIN
            COMMAND := 0;
            UNITSTATUS (1, COMMAND, 19);
            WRITE ('Typeahead is off.', CHR (31));
            END;
        'R', 'r': BEGIN
            COMMAND := 128;
            UNITSTATUS (1, COMMAND, 19);
            WRITE ('Typeahead is on.', CHR (31));
            END;
        'A', 'a': WRITE ('Aborted...', CHR (31));
    END; { CASE }
END.
```

Apple IIGS: VGC and ROM Upgrade

Revised: 9/30/96
Security: Everyone

Apple IIGS: VGC and ROM Upgrade

=====

Article Created: 12 October 1987
Article Reviewed/Updated: 30 September 1996

TOPIC -----

Beginning August 1, 1987, two free component upgrades have been available to Apple IIGS owners. This REA program ended on 31 March 1995.

DISCUSSION -----

Overview

These are the two component upgrades:

- A new ROM chip corrects minor problems and provides enhancements for future software releases.
- A new Video Graphics Controller (VGC) chip corrects video display problems that may occur in double hi-res and standard text modes.

Look at the first three digits of the serial number on the bottom of the Apple IIGS to determine which of the two upgrades your computer needs. (This is only a general guide, because a given computer may have already undergone modifications after leaving the factory. For more specific information, see the "Upgrade Part Numbers" section later in this article.) These are the guidelines:

- Computers with the first three digits of the serial number 704 or lower, generally require both the new VGC and the ROM upgrade.
- Computers with the first three digits of the serial number 705 through 724 (inclusive), generally require only the new ROM.
- Computers with the first three digits of the serial number 725 or higher, generally require neither of the upgrades.

Upgrade Part Numbers

Because some systems may have had logic board swaps since date of purchase, it's best to check the individual VGC and ROM numbers on the main logic board to be sure of which upgrade is required.

- Replace any ROM chip numbered 344-0077-A with the replacement part 344-0077-B.
- Replace any VGC chip numbered AMI 344S0046-1 or AMI 344S0046-A with the replacement part AMI 344S0046-3, IMP 344S0046, or IMP 344S0056.
- VGCs numbered AMI 344S0046-2 or AMI 344S0046-B need no replacement.

The repair extension program number is 0LR853.

***** IMPORTANT NOTE *****

This program expired on 31 March 1995 and is no longer available under an REA program. However, you can purchase the VGC IC and ROM chip as separate items. In order to pull the VGC chip off the logic board, you will also need the VGC IC extraction tool. Here are the parts you need:

342-0077 ROM, Apple IIGS
344S0046 VGC, Apple IIGS
076-0246 VGC IC Extraction Tool

Article Change History:

30 Sep 1996 - Added REA closing date and part numbers.

Pascal III: Intrinsic Units

Revised: 11/30/84
Security: Everyone

Pascal III: Intrinsic Units

=====

Intrinsic Units in Pascal allow the programmer to write and compile code in modules. The programmer can put the modules in a library; several different programs can then use them without a separate linking step. The unit is automatically loaded with the program code file when the program is executed.

The following is a simple example of how to write an intrinsic unit. It is a supplement to the information in chapter 14 of the Programmer's Manual.

First let's enter the unit. This unit has one function that asks for an integer number and returns that number doubled. From the editor, enter:

```
UNIT LIB2;
INTRINSIC CODE 10;

INTERFACE
FUNCTION DOUBLE (NUM:INTEGER):INTEGER;

IMPLEMENTATION
FUNCTION DOUBLE;
BEGIN
    DOUBLE := NUM + NUM;
END;

BEGIN
    WRITELN ('LIB2 INITIALIZATION');
END.
```

Save the file as LIB2, quit the Editor and compile the unit.

Now put the unit in a library. We suggest you use a program library for this test so that you won't have to modify the SYSTEM.LIBRARY. Here's how to do it:

```
Execute /PASCAL3/LIBRARY
The destination will be TEST2.LIB
The source is LIB2.CODE
Enter "=" to copy the entire codefile into the library
```

..TIL00646-Pascal_III-Intrinsic_Units_(TA44996).pdf

Enter "Q" to save the library and exit the program
Press return when asked for Notice?

When that's done, go back to the Editor and enter:

```
PROGRAM TEST2;  
  
USES {$USING TEST2.LIB} LIB2;  
  
VAR INT:INTEGER;  
  
BEGIN  
    READLN (INT);  
    WRITELN (INT, ' times 2 equals ', DOUBLE (INT));  
END.
```

Save the file as TEST2 and quit the Editor. Compile the program. The unit will be loaded automatically when the program is executed.

Pascal III: Regular Units

Revised: 11/30/84
Security: Everyone

Pascal III: Regular Units

=====

Regular Units in Pascal allow the programmer to write and compile code in sections. The programmer can then link the sections to form a single code file that will run without the need to refer to a library. The following is a simple example of how to write a regular unit. It is a supplement to the information in chapter 14 of the Programmer's Manual.

First let's enter the unit. This unit has one function that asks for an integer number and returns that number doubled. Enter the editor and enter:

```
UNIT LIB1;

INTERFACE
FUNCTION DOUBLE (NUM:INTEGER):INTEGER;

IMPLEMENTATION
FUNCTION DOUBLE;
BEGIN
    DOUBLE := NUM + NUM;
END;

BEGIN
    WRITELN ('LIB1 INITIALIZATION');
END.
```

Save the file as LIB1, quit the Editor and compile the unit. Now enter the program that will use LIB1:

```
PROGRAM TEST1;

USES {$USING LIB1.CODE} LIB1;

VAR INT : INTEGER;

BEGIN
    READLN (INT);
    WRITELN (DOUBLE (INT));
```

END.

Save this file as TEST1, Quit the Editor, and Compile TEST1. Now you have the code file for the unit and the program. The next step is to link them together. Enter L from command mode to get into the Linker.

The Host File is TEST1
The Lib file is LIB1
Just press return for the next two questions
The output file will be TEST1

Now TEST1 is ready to execute. Any time you change or re-compile either TEST1 or LIB1 you will have to re-link them.

Pascal II: Intrinsic Units compiler options RESIDENT & NOLOAD

Revised: 11/30/84
Security: Everyone

Pascal II: Intrinsic Units compiler options RESIDENT & NOLOAD

=====

You can get Apple Pascal version 1.1 to treat intrinsic units as segments (overlays) by using the noload (*\$N+*) and the resident (*\$R unit name*) compiler options. Units specified by these options are read in from the disk only when a reference is made to code contained within the unit. When the calling procedure is exited and all active references to the unit have been resolved, the unit is "swapped out" and the memory range can be used for other code segments. For more details on the use of these options, refer to pages 66-67 of the Pascal Language Reference Manual, and the Language Manual addendum.

The unit code with the noload option will remain in memory until the calling procedure is exited. This may result in a stack overflow (out of memory) if control never exits from such a unit after it is called repeatedly from inside the same procedure. This is a known problem, and can be avoided by specifying the unit as "Resident" within that procedure or segment. Calling the unit from within a different procedure will also remedy this. The following examples illustrate this situation:

EXAMPLEA below will generate an out of memory STACK OVERFLOW error by repeatedly loading APPLESTUFF.

```
PROGRAM EXAMPLEA;
USES APPLESTUFF;

VAR I:  INTEGER;

BEGIN (* MAIN PROGRAM *)
  (*$N+*)
  WRITE ('NUMBER OF WORDS AVAILABLE AT START OF PROGRAM :  ');
  WRITELN (MEMAVAIL);
  FOR I:=1 TO 100 DO BEGIN
    WRITELN (I, ' ', MEMAVAIL, ' WORDS');
    NOTE (25,1) (* APPLESTUFF MUSIC ROUTINE *)
  END;
  WRITELN ('PROGRAM COMPLETED SUCCESSFULLY')
END.  (* MAIN PROGRAM *)
```

EXAMPLEB uses the RESIDENT OPTION to prevent APPLESTUFF from being reloaded.

```
PROGRAM EXAMPLEB;
USES APPLESTUFF;

VAR I:  INTEGER;

BEGIN (* MAIN PROGRAM *)
  (*$N+*)
  (*$R APPLESTUFF *)
  WRITE ('NUMBER OF WORDS AVAILABLE AT START OF PROGRAM :  ');
  WRITELN (MEMAVAIL);
  FOR I:=1 TO 100 DO BEGIN
    WRITELN (I, ' ',MEMAVAIL, ' WORDS');
    NOTE (25,1) (* APPLESTUFF MUSIC ROUTINE *)
  END;
  WRITELN ('PROGRAM COMPLETED SUCCESSFULLY')
END.  (* MAIN PROGRAM *)
```

EXAMPLEC uses individual procedure to call APPLESTUFF routine, which allows unit to be released and then reloaded.

```
PROGRAM EXAMPLEC;
USES APPLESTUFF;

VAR I:  INTEGER;

PROCEDURE PLAY;
  BEGIN WRITELN (I, ' ',MEMAVAIL, ' WORDS');
  NOTE (25,1) (* APPLESTUFF MUSIC ROUTINE *)
END;

BEGIN (* MAIN PROGRAM *)
  (*$N+*)
  WRITE ('NUMBER OF WORDS AVAILABLE AT START OF PROGRAM :  ');
  WRITELN (MEMAVAIL);
  FOR I:=1 TO 100 DO PLAY;
  WRITELN ('PROGRAM COMPLETED SUCCESSFULLY')
END.  (* MAIN PROGRAM *)
```

Pascal: Speeding up Pascal text file reading (1 of 3)

=====

Although the READLN statement reads Pascal text files--for example:

```
READLN (FILEID, STRINGVARIABLE);
```

--this operation can be made much faster by using the routines contained in the following program. Three procedures do the work. Their operation is explained, line-by-line, below:

```
PROCEDURE FILLBUFFER;
    (* Fills the working buffer with data
       from the .TEXT file. *)
BEGIN
    EMPTY := BLOCKREAD (INFILE,BUFFER,2) = 0;
    (* Reads 2 blocks of the file into
       BUFFER and leaves the variable EMPTY
       equal to zero if the end of file
       marker is not yet reached.*)
    IF NOT EMPTY THEN BEGIN
        (* If there is still unprocessed data
           in the buffer, do this:*)
        NOTNULLS := BUFSIZE +
            SCAN (- BUFSIZE, <> CHR(0), BUFFER [1023]);
        (* The length of a Pascal .TEXT file
           should always be in multiples of 2
           blocks. Since strings (lines) do not
           span blocks, each block is likely to
           contain nulls (ASCII ZERO) at the end.
           This line returns the number of real
           characters in the file, and discards
           the null ones. *)
        BUFINDEX := 0;
        (* The working index into the buffer is
           reset to zero after refilling the
           buffer. *)
    END;
END;
```

```
PROCEDURE OPENFILE (FNAME:  STRING);
    (* Opens the file using the name passed
    by calling procedure.*)
BEGIN
    IF ((POS('.text',FNAME) = 0) AND
        (POS('.TEXT',FNAME) = 0)) THEN
        FNAME := CONCAT (FNAME, '.TEXT');
    (* Adds the .TEXT suffix if it's not
    already there.  *)

    RESET (INFILE, FNAME);
    (* Actually opens the referenced file.  *)

    FILLBUFFER; FILLBUFFER;
    (* The first call to FILLBUFFER skips
    over the 2 blocks of header
    information on .TEXT files.  The
    second call actually fills the buffer
    with information which will be used.*)
END;

PROCEDURE READFILE (VAR LINE:  STRING);

(* Reads from the file and returns a string at a time in the variable LINE. A
word about the Pascal .TEXT file format: Lines are stored as ASCII
characters terminated with carriage returns.  If a line contains any leading
spaces, and most Pascal source files contain some, these spaces are "packed"
into two bytes.  The first byte is an ASCII DLE (decimal 16) signifying that
the line is packed.  The second byte is a count of spaces to be expanded.
The Editor unpacks these lines automatically, as does a READLN from a file.
We do that operation ourselves in this procedure.  The increase in speed is
because we are using highly specialized routine, whereas the READLN
intrinsic is very general in nature, accepting strings, integers and reals
from the keyboard as well as from files.  Note that this format is optimized
for Pascal source files and it wastes two bytes for each and every line that
does not contain leading spaces.  *)

VAR INDENT, LINELEN:  INTEGER;  (* INDENT is the number of
                                space characters to add.
                                LINELEN is the length of the
                                new string to be formed.  *)
```

Pascal: Speeding up Pascal text file reading (2 of 3)

=====

```
BEGIN
  IF BUFINDEX >= NOTNULLS THEN FILLBUFFER;
                                (* If the buffer needs refilling,
                                go and get another buffer. *)
  IF NOT EMPTY THEN BEGIN      (* If the file is not yet empty,
                                then do the following: *)
    LINELEN := SCAN (BUFSIZE, = CHR(13), BUFFER [BUFINDEX]);
                                (* Set LINELEN to the number of
                                characters from the current
                                buffer pointer position
                                (BUFINDEX) to the next carriage
                                return in the buffer. *)
    IF BUFFER [BUFINDEX] = CHR (16) THEN BEGIN
                                (* If the character at the buffer
                                index is an ASCII DLE, then we
                                have to unpack the leading
                                spaces. *)
      INDENT := ORD (BUFFER [BUFINDEX + 1]) - 32;
                                (* Set INDENT to the number found
                                at BUFINDEX + 1, the number
                                of space characters to
                                insert. *)

      (*$R-*)
      LINE [0] := CHR (LINELEN + INDENT - 2);
      (*$R+*)      (* Turn off Range Checking so we can
                     manually change the string length. Set
                     the length of LINE to the number we had
                     already gotten plus the number of spaces
                     to unpack, throwing away two bytes for
                     the DLE and count bytes. Turn Range
                     Checking back on. *)
    IF INDENT > 0 THEN FILLCHAR (LINE [1], INDENT, ' ');
                                (* If there are spaces, then fill in the
                                appropriate number of them, starting
                                with the first position in the new
                                string. *)
```

```
    IF LINELEN > 2 THEN MOVELEFT (BUFFER [BUFINDEX + 2],
                                  LINE [1 + INDENT], LINELEN - 2);
    (* If the string is more than 2
       characters long, then move the rest of
       it from the buffer into the string
       starting just after the leading spaces
       previously inserted. *)

    END ELSE BEGIN
    (* No DLE character was found. That
       means straight ASCII. *)

    (*$R-*)
    LINE [0] := CHR (LINELEN);
    (*$R+*)

    (* Turn Range Checking off, set the
       length of the string to LINELEN, and
       turn Range Checking back on. *)

    IF LINELEN > 0 THEN MOVELEFT (BUFFER [BUFINDEX],
                                  LINE [1], LINELEN);
    (* Move the characters from the buffer
       into LINE as above. *)

    END;
    BUFINDEX := BUFINDEX + LINELEN + 1;
    (* Sets the pointer to the first
       character of the next string in the
       buffer for the next time through. *)

    END;
END;
```

Here's a program that demonstrates the difference in speed between the two methods of reading strings:

```
PROGRAM QUICKREAD; (* Very fast line read routine *)
CONST BUFSIZE = 1024;
      BUFLen = 1023;
      FILENAME = 'QWERTY9.TEXT';
(* Probably not on user disk *)
VAR LINE: STRING;
    INFILE: FILE;
    TEXTFILE: TEXT;
    CH, OPTION: CHAR;
    EMPTY, HELL_FREEZES_OVER: BOOLEAN;
    ERROR: INTEGER;
    NOTNULLS: 0..BUFSIZE;
(* # of non-null chars *)
    BUFINDEX: 0..BUFSIZE;
(* Index within buffer *)
    BUFFER: PACKED ARRAY [0..BUFLen] of CHAR;
```

Pascal: Saving a High-Res picture to a disk file

=====

Pascal graphics does not provide built-in routines to load or save the High-Res graphics screen to a disk file. The following program illustrates a simple method for saving and loading any High-Res screen created in a Pascal environment.

```
PROGRAM DEMOPIC;
(*
(*   Program loads and saves high-res screen to disk   *)
(*   12/79 based on "SLIDE SHOW" by Bill Atkinson      *)
(*
(*
USES TURTLEGRAPHICS, APPLESTUFF;
CONST HIRESPI = 8192;
VAR CHEAT: RECORD CASE BOOLEAN OF
    TRUE: (INTPART: INTEGER);
    FALSE: (PTRPART: ^INTEGER);
END;

PROCEDURE DRAWPICS;
(*
(*   Draw some stuff on the high-res screen.           *)
(*   This can be replaced with any graphics routine.   *)
(*
(*
BEGIN
    MOVETO (0,0); PENCOLOR (WHITE);
    MOVETO (279,0); MOVETO (279,191);
    MOVETO (0,191); MOVETO (0,0);
    PENCOLOR (NONE);
    MOVETO (75,95); WSTRING (' THIS IS A TEST ');
    MOVETO(28,5); WSTRING ('<PRESS RETURN TO EXIT PROGRAM>')
END;

PROCEDURE ERROR;
(*
(*   If error, program will terminate from here.      *)
(*
(*
BEGIN
```

```
TEXTMODE;
WRITELN ('ERROR ENCOUNTERED - PROGRAM TERMINATED');
EXIT (PROGRAM)
END;

PROCEDURE BLOAD (FILENAME: STRING);
(* *)
(* Blockreads the high-res buffer into memory. *)
(* *)
VAR I,IO: INTEGER;
    F: FILE;
BEGIN
    CHEAT.INTPART:=HIRESPl;
    RESET(F,FILENAME);      (* OPEN FILE FOR INPUT *)
    (*$I-*)
    IO:=BLOCKREAD(F,CHEAT.PTRPART^,16);
    I:=IORESULT;
    (*$I+*)
    CLOSE(F);
    IF (I <> 0) OR (IO <> 16) THEN ERROR;
END;

PROCEDURE BSAVE (FILENAME:STRING);
(* *)
(* Saves high-res picture to disk via blockwrite. *)
(* *)
VAR I,IO: INTEGER;
    F: FILE;
BEGIN
    CHEAT.INTPART:=HIRESPl;
    REWRITE (F,FILENAME); (*OPEN NEW DISK FILE FOR OUTPUT*)
    (*$I-*)
    IO:=BLOCKWRITE (F,CHEAT.PTRPART^,16);
    I:=IORESULT;
    (*$I+*)
    CLOSE (F,LOCK)
    IF (I <> 0) OR (IO <> 16) THEN ERROR;
END;

BEGIN (* MAIN PROGRAM *)
    INITTURTLE;
    DRAWPICS;

Pascal: Exponents

Revised: 11/30/84
Security: Everyone

Pascal: Exponents

=====

The calculation 10^X is not included in the UCSD Pascal definition. The system intrinsic PWROFTEN ("power of ten") returns 10^X , provided X is an integer in the range 0..37. (Please refer to page 45 in the Pascal Language Reference manual.)

The function EXP (in the library unit TRANSCEN) is of the form e^X , where X is a real number. The relationship between 10^X and e^X is:

$$10^X = e^{(X \text{ LN } 10)} \quad (\text{LN} = \text{natural log})$$

Here is a simple program which illustrates the use of Pascal exponents:

```
PROGRAM EXPONENT;  
  
USES TRANSCEND;  
  
BEGIN  
  WRITELN ('10 ^ 3 = ',PWROFTEN(3));  
  WRITELN ('e ^ 3 = ',EXP(3));  
  WRITELN ('10 ^ 3 by the conversion = ',EXP(3*LN(10)));  
END.
```

Pascal: Clearing the video screen

Revised: 11/30/84
Security: Everyone

Pascal: Clearing the video screen

=====

As described by Kenneth Bowles in Problem Solving Using Pascal, the routine CLEARSCREEN is a system function of the UCSD computer facility. By issuing a form feed to the standard Apple screen, the system intrinsic PAGE(OUTPUT) can perform a similar function on your system.

You can use the following procedure to clear the screen.

```
PROCEDURE CLEARSCREEN;  
BEGIN  
  WRITE (CHR(12));  
END;
```

As in the SETUP program, the procedure uses the character CHR(12) to clear the standard Apple video screen. Other external terminals may require a different value; for these terminals, modify the procedure by replacing CHR(12) with the appropriate control character (or characters) for "Erase Screen".

Pascal: Interface cards in peripheral slot #3

=====

The Pascal system will not appear to boot correctly on the standard Apple video if slot #3 has a Communications card, Serial card, or DC Hayes Micromodem card in it. Pascal reserves slot #3 for an external terminal, so when Pascal recognizes a card in this slot, it attempts to communicate with the assumed terminal and not with the default CONSOLE and SYSTERM (video and keyboard). Other cards may also cause this effect, which can be easily remedied by removing the card from slot #3.

ProDOS Filer 1.1: Changes from 1.0

Revised: 9/30/87
Security: Everyone

ProDOS Filer 1.1: Changes from 1.0

=====

This article last reviewed: 30 September 1987

These are the changes between Filer 1.0.1 and Filer 1.1. From looking at these, it seems that modification #4 may be the fix referred to in paragraph 4 above.

- 1) The critical speed tolerance of the formatting routine was extended.
- 2) The format routine was made to allow for different size volumes in the same slot. The routine now correctly uses the UNIT number in the Device List in the Global Page as a pointer into the Driver Address table. Previously, the routine would only look at Drive 1 for the information on the size of the volume and would later write out an incorrect Bit Map and Directory after the formatting of the different device in drive 2.
- 3) The volume number is now transferred from source disk to destination disk in Volume Copy. The volume number on a format is now 1.
- 4) The 'DEVICE NOT FOUND' bug when trying to format previously unformatted media was fixed.

The Formatter in ProDOS 1.0/Filer1.0 would not format a disk in drive 2 if it had never been formatted. This problem also occurred in DuoDisks. The solution was to format the disk in DOS 3.3 and then re-format the disk with the Filer. We later released a new version of ProDOS 1.1.1 and the Filer 1.1.

- 5) The standard MLI QUIT call will now be executed when a selector is present.
- 6) Formatting volumes consecutively will now start with a random 'nn' value ('/BLANKnn') in the default volume name and then continue increasing sequentially.

In addition, these are the changes made from Filer 1.0 to Filer 1.0.1

- 1) Interrupts were disabled during formatting.

2) The BitMap create routines were corrected for all disk sizes.

Hard Disk 20SC: Connecting a terminator

Revised: 9/29/90
Security: Everyone

Hard Disk 20SC: Connecting a terminator

=====

This article last reviewed: 30 September 1987

The actual Small Computer Systems Interface specification from ANSI states that each END of the daisy chained cables are terminated. This indicates that the HD20SC manual is 'incorrect' and the Apple SCSI Cabling System manual is correct.

The diagram on page 15 of the "Hard Disk 20SC Owner's Guide" shows the terminator on the extra SCSI port. On page 5 of the HD20SC manual, it shows that when connecting a single HD20S to a CPU, the SCSI System cable should connect the 2 machines, while the SCSI Terminator connects to the other port on the hard drive.

The top diagram on page 12 of "The Apple SCSI Cable System" shows the terminator goes between the cable and the (one) peripheral device. Page 10 of the SCSI Cable System manual states that for the same configuration that the System cable should connect directly to the SCSI Terminator and the other end of the Terminator connects to the SCSI device (in this case HD20SC).

In truth, both ways work. However, if you were to check the amount of line noise on both one-device setups, you might find a bit more noise on the incorrectly placed terminator configuration.

The terminator should be placed on the SCSI input of the first device. If the configuration has more than one device or more than 10 feet of SCSI cable hooked together, a second terminator should be placed on the pass through of the last device. If the user has a self-terminated SCSI device, it should be the last device on the chain. You may refer to the Apple SCSI Cabling System manual for all of the correct configurations.

Apple IIGS: Not Enough Disk space for 5.25 Desktop Disk

=====

This article last reviewed: 29 September 1987

There is no way to create a ProDOS 8 or ProDOS16 Desktop disk on a 5.25 floppy: there is just not enough disk space. However, a startup P8 (ProDOS 8) disk can be created. As an example, below are instructions of how to create a startup ProDOS 8 System Utilities disk.

1. Format a 5.25 disk
2. Copy these 5 files from System Utilities to the 5.25 disk:
 - a. P8 (ProDOS 1.2, found in the SYSTEM sub-directory)
 - b. SYSUTIL.SYSTEM *
 - c. GSSU0 *
 - d. GSSU1 *
 - e. GSSUE1 *

* These 4 files comprise the System Utilities program and can be found in the SYS.UTILS sub-directory. They must be kept in the same directory.

3. Rename the file 'P8' to 'PRODOS'

System Utilities may now be booted from the floppy disk. The files take up around 180 blocks and leave about 100 blocks for extra file storage.

ANSI S1.29-1979: Bystander Position Definition

=====

Article Created: 29 September 1987
Article last reviewed: 29 September 1987
Article last updated: 30 July 1992

The American National Standard document ANSI S1.29-1979 defines bystander position:

For equipment which does not require attention while in the operating mode, an operator position need not be defined. One or more bystander positions shall be selected and defined in the test plan or equipment specifications. The bystander position shall be 1.00 m away from the projection of the reference parallelepiped on the horizontal plane and 1.50 m above the floor. If one or more bystander positions are defined, the A-Weighted sound pressure level shall be measured for the operating mode(s) and idle mode defined in Sec.5. Section 7.3.2.1 and Fig. 2 of ANSI S1.13-1971(R1976) may be used as guide to define bystander position around the machine. The measurements shall be carried out in accordance with the procedures of ISO DIS 6081.

Macintosh II: Video Overview (2 of 3)

=====

Article Created: 10 December 1987
Article Last Reviewed: 1 July 1992
Article Last Updated:

TOPIC -----

This is the second part of a three-part article describing how the Macintosh II produces video.

DISCUSSION -----

STANDARD RGB DISPLAY SIGNAL

The Macintosh II Video Card uses an approximation of the RS343 display signal. (RS video standards are set by the Electronic Industries Association.) The RS343 display standard is essentially a monochrome video signal combined with a composite sync signal (horizontal and vertical scan control) with timings that produce a non-interlace, or progressive, scan. This means that the horizontal and vertical scan rates are timed to cause the display electron guns to produce even progressively horizontal scans. This is by comparison to the interlaced video standards. The importance of the RS343 standard is its provision for a timing and voltage level signal that allows the display and generation of high resolution video.

While the Macintosh II version of the RS343 signal varies somewhat, it essentially follows the guidelines necessary for connection to RS343 display devices. The major differences are:

- the separate TTL level composite sync signal found on pin 3
- the separate video lines used to produce RGB color
- a vertical scan rate of 66.67Hz to reduce screen flicker
- a voltage white level of 1 volt for its red and blue signals and 1.3 volts on its green signal

RS343 provides for a 60hz signal but has been changed to 66.67Hz on the

Macintosh II Video Card to prevent the screen flicker visible at 60Hz. The inclusion of the analog composite sync found on pin 5 of the video card connector, called the green signal, allows for monochrome composite video.

COMPONENTS OF AN NTSC/RS170 TIMING SIGNAL

RS170 is a standard that defines the timing of broadcast video in the United States, Japan, and several other markets. It specifies a 15.75KHz horizontal and a 60Hz vertical interlaced scan frequency. Interlacing is the process by which two fields, called scan lines, are interleaved on the screen. Due to the limitations of video devices at the time of the RS170 standard's creation in 1957, the speed of broadcast signals and picture tubes required the image to be displayed in part. The solution allowed for the partial update of video pictures to remain unnoticed to the viewer. An RS170 video frame contains 525 lines and is displayed 60 times per second -- for a total of 15,750 lines, or 15.75KHz. Of these lines, only the odd or even lines are displayed with each frame. A total of 60 frames per second allows for 30 frames per second, or 30Hz update of each line. Like the RS343 standard, RS170 is strictly a timing specification for monochrome video signals. By combining three such signals to control individual red, green, and blue sweep circuits, a full color system can be created. The RS170 mode was included on the Macintosh II video card as a way for large screen projectors, not capable of high frequency scans, to display the Macintosh II video in the usual broadcast standard of RS170.

THE MACINTOSH VIDEO CARD RS170 MODE

To produce RS170 video, software can be written to logically select the proper timing values and pixel clock from the Macintosh II video card. The pixel clock is a 12.2727MHz oscillator built on the video card and is selected over the 30.24MHz oscillator used in the RS343 mode. With the selection of the RS170 mode, a red, green, and blue signal with a separate TTL composite sync are produced. An analog composite sync pulse is superimposed on the green channel, allowing this signal to drive broadcast devices such as a television, to produce a monochrome image.

NTSC VIDEO (RS170A)

This is not available directly from the Macintosh II video card, but can be produced from the video signals supplied.

When color televisions became available, studios had to decide how to place color onto the broadcast bandwidths delivering black and white signals. There being very little space to work with, the solution was to use a color subcarrier signal modulated onto the luminance signal. The luminance signal controls the intensity of the black and white image. To place the color signal, or chrominance, onto the video signal, an NTSC color encoder is used. This effectively combines the primary additive colors red, green, and blue into a wave form. An output device filters the color signal from the luminance signal and recalculates the original values. To connect an NTSC color encoder, outputs for horizontal sync, vertical sync, blanking period, red, green, and blue in RS170 levels are required. These signals are all available on the Macintosh II video card

and are discussed in the document "About Macintosh II Video Signals."

Can I connect a Macintosh to Datakit or the "commercial" offering of Datakit, AT&T's Information Systems Network, ISN.

DISCUSSION -----

The AT&T Datakit VCS (Virtual Circuit Switch) is an architecture for high-speed data communications between computers and terminals of different types. It supports both terminal-to-computer and computer-to-computer communication. Functionally, it uses an internal packet switch capable of switching 44,000 packets per second.

A virtual circuit is a sequence of packets joined together by a "switch" module (switch circuit pack) to form a transmission path between host computers and network destinations (host, personal computers, modem pools, etc). After a connection (circuit) is made, subscribers can talk to only that destination until they make an explicit request to terminate or suspend the connection. The physical link can be one of four different types:

- RS-232C sync or async
- Parallel flat band cable, optical fiber, or two 50-wire cables using balanced transmission for multiple host interfaces

- Optical fiber trunk links
- RS-232C or V.35 connection for a DDS or T1 trunk

Apple supports the RS-232C interface in a wide variety of terminal emulation modes and can provide a solution for replacement of a "dumb" terminal with a computer connected to the Datakit VCS for the host connection.

The fundamental architecture for Datakit and ISN is the same. Both use centralized short-bus architecture to implement local-area networking. Both use AT&T's contention mechanism known as "perfect scheduling" to packetize transmissions on a time-slotted bus. This contention scheme provides for no destructive collision or periods of idleness on the bus, in contrast to distributed bus and ring architectures.

The basic scheme of the LAN is to connect devices, via copper or fiber, to interface modules residing in a centralized cabinet. This cabinet houses the control circuitry necessary to assemble, address, route, establish circuit take-up/take-down, synchronize, disassemble, and so on. Control cards, along with interface cards for devices and circuits, meet with the backplane of the cabinet to form the "short-bus." Imagine a star configuration meeting at the center to create a bus.

The backplane bus is short. In ISN, it is about 5 meters, running at 8.64Mbps (48,000 packets/second, each packet 180 bits). Propagation delay is minimal along the bus (less than 2 percent of the first bit of transmission is exposed before the receiving device sees it).

Datakit uses a 2-bus scheme, while ISN uses a 3-bus scheme. One packet period prior to the transmission of data, ISN resolves contention on the third bus. Packet headers contain a module number related to the sending device. This, along with a priority code, comprises the packet contention code. Basically, the module having the highest contention code wins access to the bus for any particular time slot on that bus, resulting in perfect scheduling.

It's best to think of ISN as a phone system. Everyone has potential access to everyone else via the "switching" capabilities of ISN. PC# 1 needs to communicate with Host A, so PC# 1 breaks into an ISN session, "dials" (literally or by keyboard) the host, and is connected via routing mechanisms of the ISN.

ISN provides a large assortment of interface modules for connecting trunks and data equipment. ISN are modular in nature and can grow to several thousand devices, using concentrators and inter-networked packet controllers.

Some of the interface modules include:

- Async Interface Modules (AIMs)
- StarLan Interface Modules (SLIMs)
- Fiber Interface Modules (FIMs)

- Ethernet Interface Modules (EIMs)
- Trunk Interface Modules (TIMs)
- 3270 Terminal Switching
- Synchronous Transport (for Cluster Controller interfacing)

It is possible that the Macintosh can interface with ISN (Datakit) as an asynchronous terminal connected to an AIM board. The AIM board is looking for an 8-pin modular tipped connect, RS232. Synchronously, there may be problems if the ISN had to handle. For example, a Netway 1000 looking at one of its synchronous transport cards. Issues critical to the success of this idea might prove to be the administration of buffers and taking advantage of ISN's flexibility in defining packet sizes. Of course, you need the proper cable and connector spec in both configurations.

Another possibility is using Ethernet Interface Modules to bridge AppleTalk networks that incorporate Ethernet in their design.

AT&T Computer Systems enhanced its Datakit II Virtual Circuit Switch line by adding token ring support, support for AppleTalk networks, and by including access to multiple hosts. Release 2.0 of the product includes the capacity to relay switch, two-way communication between Datakit terminals and X.25 hosts on public and private packet networks. Disk storage was increased to include support of a 40MB SCSI hard disk and tape subsystem. Current users of the product can upgrade. An optional offering is the Maintenance and Redundancy Control Module, an interface which lets you switch the unit from a primary network to a backup.

To locate a vendor's address and phone number, use the vendor name as a search string.

AppleTalk: Connecting to InteCom IBX

Revised: 11/2/88
Security: Everyone

AppleTalk: Connecting to InteCom IBX

=====

This article last reviewed: 29 September 1987

To link up AppleTalk via an InteCom IBX switch, use the LANmark Ethernet on the IBX. LANmark is a featured product of InteCom, the IBX folks. The LANmark Ethernet is a slower (1Mhz vs 10 Mhz) version of an ordinary Ethernet. Then use a Kinetics PastPath Bridge to connect AppleTalk to the Ethernet. Both Kinetics and InteCom should be able to supply you and RPI with more detailed information.

Also, you can less expensively but not as elegantly use half-bridges such as those from Hayes and connect via Synch or Asynch Data Option Boards.

Apple IIGS: How To Pick Up Video Blanking Signals

Revised: 3/23/89
Security: Everyone

Apple IIGS: How To Pick Up Video Blanking Signals

=====

This article last reviewed: 29 September 1987

There is no way to physically pick up the video blanking signal since it is now buried inside the VGC chip. However, through software, there are two ways to pick up this signal.

1. Arm the Vertical Interrupts as one would do with an Apple IIc.
2. Read the Vertical Blanking location at \$C019 as one would do with an Apple IIe.

Research the appropriate manual for how to do these operations. If a routine is written to handle video timing for the Apple IIe by picking up video blanking signals from an IO chip (UE5), the routine can be converted for the IIGS environment with these two techniques.

LaserWriter: PostScript Command For DTR Protocol

Revised: 3/4/90
Security: Everyone

LaserWriter: PostScript Command For DTR Protocol

=====

This article last reviewed: 9 November 1988

To interface a LaserWriter with an IBM compatible, WordPerfect 4.2, which now claims support for the LaserWriter, furnishes a segment of PostScript code with the file name INITWRT.PS. This file, according to their instructions, is to be sent to the printer via the serial port to change the EEROM so that the LaserWriter will thereafter support a hardware protocol, specifically DTR.

Leaving out the comments and password checking, the essential PostScript code that is sent to the LaserWriter is

```
25 9600 7 SETSCCBATCH
```

The channel and baud numbers are default, but the LaserWriter Technical manual mentions only integers 0 through 3 for the parity position and mentions nothing about 7.

The code would have no effect on the AppleTalk Network. This code makes changes strictly in the LaserWriter and then only where specified by the code (batch or interactive). This code does not affect the "SPECIAL" mode. SCCBATCH is only for the "9600" or "1200" switch positions in Diablo emulation mode for using PostScript with the printer. The "SPECIAL" mode is controlled by SCCINTERACTIVE, and the line

```
25 9600 7 SETSCCINTERACTIVE.
```

could control the Diablo 630 mode functions under 9600 and DTR protocol.

The only problem is that unless the user has a LaserWriter Plus or a LaserWriter with 2.0 (or later) ROMs in it, this "7" command is useless. Since the LaserWriter only supports Xon/Xoff flow control, any command sent to set up DTR handshaking will not function, and there may actually be some strange actions from the printer if it is attempted. If they don't have 2.0 or later ROMs in their LaserWriter, do not use this code.

Macintosh II: Video Overview (3 of 3) (2/95)

=====

Article Created: 10 May 1988
Article Reviewed/Updated: 14 February 1995

TOPIC -----

This is the last part of a three-part article describing how the Macintosh II produces video.

DISCUSSION -----

Color Burst

A reference signal by which color signal values can be determined. The phase of a color signal in relation to the color burst signal indicates hue. This is located on the trailing edge of the horizontal video signal and is known as a back porch.

Chrominance

The 3.58MHz subcarrier that contains the signal for color value of each pixel:

Red signal: 90 degrees out of phase
Green signal: 0 degrees out of phase
Blue signal: 180 degrees out of phase

The red, green, and blue signals (RGB) can vary in hue depending on their phase with the sync signal. A variation in signal magnitude increases or decreases the intensity of the color.

Macintosh II Video Modes Revisited

- RGB RS343 compatible is an RGB video signal with separate TTL sync. It is timed by a 30.24 MHz oscillator. 1 volt signal. 75 ohm terminated. An analog standard level sync is available on green.

- RGB RS170 interlaced is an RGB video signal with sync. It is timed by a

12.2727 MHz oscillator. Its horizontal signals are alternately spaced in relation to the vertical blanking period. The electron beam moves down from the left corner to the right and from the bottom right corner to the top, to begin again in the center or the corner of the screen. In this way, there are twice the of number rows than are being displayed in each frame. Each row follows a slightly slanted path. One begins at the top left corner and slants downward, while the other begins from the top and center. These interlaced lines provide a greater number of images to the eye, to compensate for a slow refresh time.

In the RS170 mode, the sync signal has been combined with the green signal. A television or similar monitor could take advantage of this signal in black and white only.

Picture Quality

Bandwidth is the signal width. It describes how much information is being delivered. The higher the bandwidth, the more video information that can be delivered and displayed by a monitor.

Pixel size is the size of the phosphor dots on the screen. It determines the precision in which the video information can be duplicated.

Dot pitch is pixel size.

Scan rate is the time period in which the electron gun moves across one line of the screen or repeats one entire screen. These values are known as the horizontal and vertical sync periods, respectively.

Grill pitch is the width of the lines in the color mask used to block the color electron beams. It is usually measured at the phosphor positions, and is synonymous with dot pitch.

Pin cushion is a display effect of warping or curved display screens.

Convergence is beam position accuracy. Color systems require exact accuracy of beams, both for position and speed, to properly produce the desired colors from their phosphors.

Pascal: Pascal Turnkey

Revised: 12/5/84
Security: Everyone

Pascal: Pascal Turnkey

=====

Create a Pascal Turnkey system by transferring the desired program code to the boot diskette and changing its name to System.Startup. When no file by that name is present on the boot volume, the system defaults to the command line.

To execute the System.Startup code from the command line, type X (for execute), and then

SYSTEM.STARTUP.

The final period prevents the operating system from appending the .CODE suffix to the file name before trying to execute it.

Pascal: External references

Revised: 12/5/84
Security: Everyone

Pascal: External references

=====

Apple Pascal may only "externally" link assembly routines. However, Pascal procedures compiled separately can be placed into a library unit and accessed with the USES command.

Assembly code may also be placed into library units, provided it's called from the Pascal level. To do so: assemble the code file(s) and create a Pascal unit which refers to each .PROC and .FUNC of the code as EXTERNAL. To create an intrinsic unit containing assembly code, link the external references to the compiled P-code unit structure, then install this completed unit in the System.library file on your boot disk.

Since the regular units which reference assembly code are not linked prior to installing the library file, install the unlinked Pascal units in the System.library or in your own library file to keep these assembly code file(s) on hand. Link the assembly routines into the final code file when you link the host program with this regular unit.

System 4.0/Finder 5.4: Alarm Setting Won't Stay On (9/95)

Revised: 9/20/95
Security: Everyone

System 4.0/Finder 5.4: Alarm Setting Won't Stay On (9/95)

Article Created: 29 September 1987
Article Reviewed/Updated: 19 September 1995

TOPIC -----

Every time I turn off my Mac Plus I lose the alarm clock setting. I am running System 4.0. Why does this happen?

DISCUSSION -----

In a Macintosh Plus with System 4.0 and Finder 5.4, a set alarm clock functions properly as long as system power stays on. If the system is powered down and back up again, a quick check of the alarm clock reveals that the switch to the alarm clock is turned off.

This does not occur under the previous system software, System 3.2 and Finder 5.3. You will need to upgrade to a more current version of the system software or revert to the previous version to correct this problem.

Pascal: SCAN function

Revised: 12/5/84
Security: Everyone

Pascal: SCAN function

=====

The Pascal SCAN function scans a range of memory, searching for a specified target. This function takes the form:

SCAN (Limit, PEXPR, Source)

where Limit is the number of bytes scanned, PEXPR defines the target and Source is the variable. The Pascal Language Manual on pp. 51-52 describe this function in greater detail.

Use SCAN on any variable except file types. When scanning string S, for example, specify Source as S[1] to avoid having SCAN look at the length parameter stored in S[0], which usually yields an erroneous value.

Pascal: TRUNC and ROUND functions

Revised: 12/5/84
Security: Everyone

Pascal: TRUNC and ROUND functions

=====

The TRUNC and ROUND functions are available in Apple Pascal. The ROUND function is of the form $I := \text{ROUND}(R)$, where I is an integer and R is a real number.

TRUNC takes the form $I := \text{TRUNC}(R)$, where I is an integer and R is a real number, and $I := \text{TRUNC}(L)$, where L is a long integer. In all cases, integer values must be in the range -32767 to +32767; otherwise, a value range error is returned.

Although the compiler may accept other forms of these functions, these are the only legitimate forms according to UCSD definitions.

ImageWriter: Cleaning Guide Rails Solves Registration Problem

Revised: 12/17/87
Security: Everyone

ImageWriter: Cleaning Guide Rails Solves Registration Problem

=====

This article last reviewed: 1 December 1987

As ImageWriters and wide-carriage ImageWriters become older, the lubricants used on the carriage rails tend to dry up and prevent the carriage assembly from moving freely during printing. This can lead to unacceptable horizontal print registration: columns of characters don't line up properly from one line to the next, and appear to be shifted anywhere from one dot to half a character.

When this happens, thoroughly clean both guide rails with a degreasing solution and lint free cloth, then lubricate them. Clean the rail all the way around, not just the surface area visible from the top.

Pascal: Converting strings to numeric variables (1 of 2)

=====

Apple Pascal doesn't allow you to edit integer or real variable inputs. If the wrong data is entered by mistake, the program will be stuck with that data; worse yet, the system may crash.

The STRINGSTUF intrinsic unit is designed to avoid this problem. All data is entered in the form of strings, then converted to the appropriate data format by the unit. This allows you to edit the input data while it is still in string form. STRINGSTUF is located on the no-longer distributed Apple Graphics software package for the Apple II. If you're unable to locate a copy of this software, refer to the article that contains the STRINGSTUF code and instructions on its use: Apple Orchard, Vol. 1, #3, p. 59. The article is by Jo and Frank Kellner.

The STRINGSTUF unit and accompanying demo program are designed to run in versions of Pascal released later than version 1.0. Long integers are not supported in STRINGSTUF.

Locate STRINGSTUF in any unused segment number between 17 and 31. Install the unit in SYSTEM.LIBRARY, following the instructions in the Pascal Operating System Reference Manual on pp. 186-193.

Pascal: Intrinsic unit for Silentye procedures (1 of 3)

Revised: 12/5/84
Security: Everyone

Pascal: Intrinsic unit for Silentye procedures (1 of 3)

=====

Appendix D (pp. 53-59) of the Silentye reference manual indicates that all parameter procedures can be placed into an intrinsic library unit. This is a handy and valuable unit to have if you plan to use the Silentye printer in a Pascal program.

To extend the usefulness of the Silentye unit, two procedures have been added to this listing and another has been changed. These three procedures are discussed here; refer to the Silentye manual for a description of the remainder.

Procedure SetPage (Page: integer):

This procedure allows you to change from one high-resolution graphics screen to the other; however, only the first high-res page is used in the Pascal system. Values: 1=first page; 2=second page.

Procedure ColdStart:

The ColdStart procedure resets the Silentye parameters to the default values as specified in the printer manual. This procedure is equivalent to turning off the power to the printer. Values: none required.

Procedure WarmStart:

The Restore procedure as listed in the Silentye manual has been revised and renamed WarmStart. Included in the revision is the SetPage procedure. This procedure differs from ColdStart in that the parameters set by WarmStart are user-definable; that is, they reflect the particular setup that you find most applicable to your needs. For instance, you may set a darkness setting to 3 or 5, and so on.

Initialization Code:

The initialization code consists of a call to the ColdStart procedure. This call is executed when the unit is first brought into the system from the

library to ensure that the printer is not retaining any settings from previous uses with either Pascal or BASIC. If you wish, you may change this code to WarmStart or another code of your choice; you may also leave the initialization section empty, though in that case you should still include the BEGIN and END.

Installing the Unit:

The Silentype unit comes ready for you to enter it, compile it and install it in your copy of SYSTEM.LIBRARY, though you may wish first to change the Intrinsic Code value or the contents of WarmStart to suit your individual needs. Refer to pp. 186-193 of the Apple Pascal Operating System Reference manual for the instructions for placing the compiled Silentype unit into your SYSTEM.LIBRARY.

Security: Everyone

Pascal II: Operand Formats (1 of 4)

=====

When you need to send data (especially complex data formats, such as strings) to an assembly routine from a Pascal host program, it can be very useful to be familiar with the internal structure of Pascal variables. This article describes a few of the more commonly used variable types; for a complete description of the more complex variables, including records and arrays, see pp. 227-228 of the Apple Pascal Operating System Reference Manual.

Machine language (assembly) routines are commonly used either when (a) speed is critical, or (b) when the code must access other assembly routines (such as PROMs or I/O drivers) that can't be reassembled as part of the program. Also, bit manipulations such as right-shift are much easier to do in assembly than in Pascal.

In the UCSD Pascal system, it's fairly easy to create short assembly programs which can be linked into a Pascal host program. In some cases, it may be sufficient to merely call the assembly routine; most routines require that data be passed to them, though. Data is passed to or from routines by means of a "parameter", a temporary variable created by Pascal specifically for that purpose. The term "Var parameter" implies that the address of the actual variable is passed to the routine as a parameter instead of its value.

Certain types of variables may be passed by value, but any variable may be passed by name by simply declaring it to be a Var parameter. Pascal does not allow parameters of variable length (with the exception of certain sets and long integers) to be passed on the CPU stack, since doing so could end up filling the stack to capacity and thereby crashing the operating system. These parameters, therefore, are automatically used as if defined as Var parameters. A good explanation of the various methods of passing parameters may be found in Peter Grogono's book, "Programming in Pascal".

Before delving into the details, let's define some terms and conventions which we'll use later on:

Bit = a binary digit (0 or 1). A bit is the smallest unit of information which can be stored in a computer.
Nybble = 4 bits (half a byte). A hexadecimal digit is one nybble

(pronounced "nibble").
Byte = 8 bits (2 nybbles). This is the unit of storage which the
6502 processor uses.
Word = 2 bytes (16 bits). A word is the unit of information which
Pascal uses.
LSB = least significant bit
MSB = most significant bit

decimal	65535	0
hexadecimal	\$FFFF	\$0000
	MSB	LSB

This diagram of memory structure is useful for understanding the format of variables: although we're used to writing numbers from left to right, Pascal reads data from memory FROM RIGHT TO LEFT, starting at the least significant byte.

Pascal II: Operand Formats (2 of 4)

Revised: 12/5/84
Security: Everyone

Pascal II: Operand Formats (2 of 4)

Integers:

Integers in UCSD Pascal are whole numbers between -32768 to +32767, inclusive. They are stored in one word (2 bytes). Negative integers are represented in "two's complement," which means that they appear to have positive values greater than 32767; the negative integer is arrived at by subtracting 2^{16} (65536) from this positive value. Similarly, large positive integers are stored as a complementary negative numbers (cf. Integer BASIC). The sign bit (MSB) is 0 if positive, 1 if negative.

```
<-----byte----->    <-----byte----->
15 14 . . . . . 8 7 . . . . . 0    <== 16 bits
Sign                Integer Value
```

Example: the number 3 is represented in binary as:

```
MSB 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 1 1 LSB
```

However, -3 is represented as:

```
MSB 1 1 1 1 1 1 1 1 1 1 1 1 1 1 0 1 LSB
```

which also reads as 65533 (or 65536-3)!

Integers may be passed by value or as Var parameters.

Reals:

Real numbers, in UCSD Pascal, are floating point numbers between +/-1.17550E-38 to +/-3.40282E+38, inclusive. Real numbers take up four bytes (2 words) of storage. Their binary representations are similar to the proposed IEEE standard for floating point numbers:

```
31 30 . . . . . 23 22 . . . . . 0    <== 32 bits
Sign      Exponent                Mantissa
```

"Mantissa" is the name given to the decimal portion of a number; by convention, it's expressed in scientific (exponential) notation. The "exponent" indicates the power to which the mantissa is raised. The exponent is represented in base 2 (2^n). The number 3×10^2 , for instance, is defined as having a mantissa of 3, an exponent of 2, in base 10 (decimal).

The sign bit refers to the sign of the mantissa; it's 0 if positive, 1 if negative. The exponent is "offset" by 127; that is, a value of 127 in the exponent field corresponds to an exponent of 0. Similarly, if the value is 1, the exponent is -126, and if the field is 254, the exponent is +127. A value of 0 indicates that the real number is 0.

The mantissa of the real number is stored in normalized format in bits 0-22. "Normalizing" a number means adjusting it so that the highest bit is significant (that is, set to 1). The exponent indicates how many times (and in which direction) the value was shifted during normalization.

Notice that the MSB of the mantissa of any non-zero number that has been normalized is always a one. Zero can be treated as a special case: the exponent is simply set to zero. So, to gain additional precision, the mantissa has an implied "1" that is not stored, resulting in a functional 24-bit mantissa, even though only 23 bits are actually used. This gives slightly more than a 6-decimal-place (single precision) accuracy.

To make this clearer, let's look at some examples:

```
Real number = 1
MSB 0      01111111      000000000000000000000000 LSB
Exponent = 127 ( $2^0$ ) Mantissa = 1 (the implied 1 isn't stored)
```

```
Real number = -9.9
MSB 1      10000010      00111100110011001100110 LSB
Exponent = 130 ( $2^3$ ) Mantissa = 99000015
```

In the second example, the real number (in binary) appears as 1001.1110011... During normalization, the decimal point is moved to the left 3 times (incrementing the exponent), and the most significant bit becomes implied. The sign bit is 1, indicating that the number is negative.

Real numbers may be passed by value, or else they may be defined as Var parameters and then passed by address.

Pascal II: Operand Formats (3 of 4)

Revised: 12/5/84
Security: Everyone

Pascal II: Operand Formats (3 of 4)

Characters:

Characters, by ASCII definition, are simply integers between 0 to 255, inclusive. Characters take up one word of storage. The ASCII value of the character is stored in the least significant byte. The most significant byte is not used by Pascal and should be ignored.

15 8 7 0 <= 16 bits
unused ASCII

Example: the character "A" has an ASCII value of 65 (hexadecimal 41). The binary representation is:

MSB x x x x x x x x 0 1 0 0 0 0 0 1 LSB
<----- not used-----> 4 (hex) 1

Characters can be passed either as actual parameters (by value) or as Var parameters (by address).

Strings:

A string is a packed array of characters that can be from one to 256 bytes long. The first byte of a string always contains a number from 0 to 255; this number indicates the length of the string. One character is stored per byte, and the string ends on a word boundary--that is, if the last character in the string is the first byte of a new word, the other byte of the word is also reserved and not used by the string.

Each character of the string can be accessed in a packed array of characters; you cannot, however, access the length byte (the 0th element). Doing so causes the message "Value Range Error" to be displayed.

Example: The string "ABCD" has a length of 4. It looks like this:

S[4] S[3] S[2] S[1] S[0]
MSB 01000100 01000011 01000010 01000001 00000100 LSB

"D"	"C"	"B"	"A"	4
-----	-----	-----	-----	---

Pascal always passes strings by address, since strings' lengths may vary.

Pointers:

Address pointers are unsigned integers that occupy 1 word of storage. Their format is identical to that of integers, except that their values may range from 0 to 65535. The value of a pointer, in this implementation of Pascal, is the memory address of the object being described.

Example: The address of AN0 (one of the annunciator ports) is hex C058 (49240 decimal). This address is stored as:

MSB	1	1	0	0	0	0	0	0	0	1	0	1	1	0	0	0	LSB
	<----->				<----->				<----->				<----->				
	C				0				5				8				

Pointers, like integers, may be passed by value or by reference (as a Var parameter).

Long Integers:

Long integers are a special type of variable, first defined at UCSD as part of their extensions to the Pascal language. They are primarily used to handle calculations involving numbers which (a) cannot be represented accurately in floating point (real) format, and (b) are too large to store in integer format.

Long integers are stored in BCD (binary coded decimal)--one digit per nybble. One entire word is reserved for the sign of the long integer, and the variable must end on a word boundary. Four digits can be contained in one word, so the smallest definable long integer takes up two words of memory. The numbers are padded with leading zeroes when necessary to fill up the last word. The sign is 0 if positive and 255 if negative. (One byte is used for the sign.)

To illustrate the structure of long integers, let's take a specific example: the long integer -123456 takes 3 words: one for the sign, and two for the digits (since they are stored in multiples of 4). This long integer is stored in the following format:

<----- each digit is one nybble ----->																
MSB	6	5	4	3	2	1	0	0	0	0	F	F	LSB			
	<-- word -->				<-- word -->				< sign word >							

A long integer should always be passed by address, since its length depends on its definition.

Pascal II: Operand Formats (4 of 4)

Revised: 12/5/84
Security: Everyone

Pascal II: Operand Formats (4 of 4)

=====

Booleans:

The Boolean (binary) variable can have two values: TRUE and FALSE. Booleans are most commonly used in determining yes/no conditions, such as equality or set inclusion. Boolean variables are stored in one word, though only the LSB (least significant bit) is used. TRUE is represented by a 1; FALSE is represented by a 0.

MSB	15	8	7	0	LSB
																	Boolean

UCSD Pascal does not allow direct printing of Boolean variables. For example:

```
Program PrintBoolean;
Var A: boolean;
Begin
  A := FALSE;
  Writeln (A);    (* this is illegal *)
  If A = FALSE Then Writeln ('FALSE') Else Writeln ('TRUE');
  (* this is correct *)
End.
```

Booleans are most efficient in packed arrays, where each bit of the word is utilized. DrawBlock is probably the best-known example of this use. An excellent example of the use of boolean packed arrays is in the GrafDemo program on the Apple Pacal diskette APPLE3.

Boolean variables may be passed by value or by address.

Other Types:

In addition to all the above standard types, Pascal allows the programmer to define a wide variety of non-standard variable types. Probably the most popular example of this is the SET.

A set is an arbitrary collection of elements with each element assigned an

ordinal position (that is, represented by a number). Each element of the set is represented by a name; you may choose any word for this name, except for (a) words reserved by Pascal, and (b) other variable definitions already in use. Each name is then associated with one bit in the data definition, beginning with bit 0. The set is stored in memory as a series of bits identified by the ordinal position of the element in the type definition. A set must end on a word boundary: for example, 17 elements would take up 2 words, even though only one bit of the second word is actually used.

Example:

```
Type Colors = (Red,Green,Blue,Yellow,Black,White);
ColorSet = Set of Colors;
```

is a set of colors. Red occupies position 0, and white has position 5.

```
<-----one word----->
MSB 0 0 0 0 0 0 0 0 0 0 1 1 1 1 1 1 LSB
      W B Y B G R
      h l e l r e
      i a l u e d
      t c l e e
      e k o   n
                w
```

Sets may be passed either by address or by value, with certain restrictions. See p. 203 of the Pascal reference manual for details.

In general, complex record types consist of one or more standard types, each stored as described above. For the last word on Pascal data types, read Niklaus Wirth's Report in "User Manual and Report" by Jensen and Wirth.

Pascal: Run-time errors

Revised: 12/5/84
Security: Everyone

Pascal: Run-time errors

Run-time errors generate an error message, as well as a set of numbers that refer to the instruction during which the error occurred. "S" stands for "Segment", "P" for "Procedure" and "I" for "Instruction Count". These can be correlated with the textfile by using the System List options, (*\$L+*) or (*\$L<filename>*), while compiling. Doing so produces an annotated listing of the text, with the S, P and I numbers included.

For example, here's a very simple program compiled with the listing option:

(1)	(2)	(3:4)	(5)<--Text----->
1	1	1:D	1 (*\$LPrinter:*)
2	1	1:D	1 Program Example;
3	1	1:D	3
4	1	1:D	3 Var S:string;
5	1	1:D	44
6	1	1:0	0 Begin
7	1	1:1	0 Readln(S);
8	1	1:1	21 Writeln(S)
9	1	1:0	40 End.

Key:

- (1) Line number of text
- (2) Segment number (S#): When S# values do not appear in your listing, the error occurred in that segment of the operating system. S#0 is System.Pascal, while S#17-31 are usually SYSTEM.LIBRARY segments.
- (3) Procedure number (P#) is the number within the segment designated by the S#.
- (4) Nesting level (D=declaration)
- (5) Instruction count (I#) is the number of instructions counted from the beginning of the procedure. It indicates the count at the beginning of each line; a value between two lines, then, means the error occurred in

the middle of the line.

Warning: When using Apple Pascal Version 1.0, do not use \$L+ as your listing option. Doing so will cause you to lose your code file, and possibly your operating system. Instead, specify a disk file on a volume other than the one that you wish to be the destination of your code file. Better yet, use (*\$LPrinter:*) to put the listing directly onto your printer. The \$L+ option works correctly in later versions.

Pascal: Real number format

Revised: 12/5/84
Security: Everyone

Pascal: Real number format

=====

Real numbers in UCSD Pascal are floating point numbers between +/-1.17550E-38 and +/-3.40282E+38, inclusive. Real numbers take up four bytes (2 words) of storage. Their binary representation is similar to the proposed IEEE standard for floating point numbers:

31	30	23	22	0	<=	32 bits
Sign	Exponent						Mantissa												

"Mantissa" is the name given to the decimal portion of a number; by convention, it's expressed in scientific (exponential) notation. The "exponent" indicates the power to which the mantissa is raised; it's represented in base 2 (2^N). The number 3×10^2 , for example, is defined as having a mantissa of 3 and an exponent of 2, in base 10 (decimal).

The sign bit refers to the sign of the mantissa; it's 0 if positive, 1 if negative. The exponent is "offset" by 127--that is, a value of 127 in the exponent field corresponds to an exponent of 0. Similarly, if the value is 1, the exponent is -126, and if the field is 254, the exponent is +127. A value of 0 indicates that the real number is 0.

The mantissa of the real number is stored in normalized format in bits 0-22. "Normalizing" a number means adjusting it so that the highest bit is significant (that is, set to 1). The exponent indicates how many times, and in which direction, the value was shifted during normalization.

Notice that the MSB of the mantissa of any non-zero number that has been normalized is always a one. Zero can be treated as a special case--the exponent is simply set to zero. For the sake of additional precision, then, the mantissa has an implied "1" that is not stored, resulting in a functional 24-bit mantissa, even though only 23 bits are actually used. This structure yields slightly more than a 6-decimal-place (single precision) accuracy.

Real numbers may be formatted for output by means of field-width designations. As described on pp. 36-37 of the Apple Pascal language Reference Manual, the output specification has the following form:

Real : FieldWidth : FractionLength

where FieldWidth is the minimum number of characters written, including the decimal point (default=1). FractionLength is the number of digits to be written after the decimal place (default=5). Thus, a field specification of R:8:3 indicates the real variable R, printed within a field size of 8, with 3 of those digits appearing to the right of the decimal. A FractionLength of zero is illegal.

If the field size necessary for displaying the variable accurately is greater than the formatting specification, the formatting is ignored. If the size is smaller than FieldWidth, the field is padded with blanks to the left of the variable; the variable is thereby right-justified.

Pascal II: Library units (1 of 2)

Revised: 12/5/84
Security: Everyone

Pascal II: Library units (1 of 2)

=====

"Modular programming" is defined as the separation of procedures and functions, or groups of them, from the main program. Source language modules, called "units", are incorporated into libraries for use with Pascal programs. Units may consist of procedures and functions, or a combination of them written in Pascal or assembly language.

Compiling routines separately--a necessary part of modular programming--affords you a major advantage in the development of your program: it allows you to approach the task as a group of smaller tasks linked together in a logical manner. The host program must contain a USES statement in order to use routines from the unit.

The two principal kinds of units are called "Regular" and "Intrinsic". NOTE: You are not afforded the capability of having separate units in Apple Pascal.

Regular Units:

When a host program "uses" a regular unit, the Linker physically inserts the unit's code into the host's codefile. Once linked, the files don't need to be relinked until either the unit or the host program is modified and recompiled.

Regular units, since they become part of the host file, may have references to file names. A regular unit may use an intrinsic unit or another regular unit. NOTE: Regular units in version 1.0 of the Apple Pascal system are unable to use intrinsic units.

Install your Regular units in SYSTEM.LIBRARY or in any other library file. Once installed in an alternate library, the Uses statement should include the compiler option \$U <library name> before the unit name.

Intrinsic Units:

An intrinsic unit is pre-linked--that is, it contains sufficient information to allow the host program to use it without invoking the Linker. The code for an intrinsic unit remains in the SYSTEM.LIBRARY and is loaded into memory before the host program begins its actual execution. This keeps the size of the host

program down; it also allows you to modify and recompile the unit and host program individually without relinking them.

Intrinsic units must be installed in SYSTEM.LIBRARY. Intrinsic units may use other intrinsic units; they may NOT, however, use a regular unit.

NOTE: Intrinsic units may not reference files, such as data files, in Pascal version 1.0.

Assembly Routines as part of Units:

Assembly language routines may be placed into library units. With intrinsic units, the unit is compiled, the machine language routines are assembled, and then the assembled code is linked to the unit prior to installation of the unit into SYSTEM.LIBRARY.

Regular units may also contain machine language routines; however, these routines are not linked to the unit before it's installed in the library. Instead, the host program, the unit and the assembly routines are linked together at the same time.

Additional Notes on the Construction of a Unit:

Any unit which does not contain at least one procedure in the Interface section cannot have an Implementation section. In such a case, however, do include the initialization section--that is, the BEGIN and END.

Procedures listed in the Interface section are "public" to the host program as well as to the unit. Procedures listed only in the Implementation section cannot be accessed by the calling program; such procedures are called "private." When procedures are not listed publicly, they cannot be called from the host; furthermore, the Implementation section is not allowed.

Any intrinsic unit containing a global variable, either public ones (defined in the Interface) or private ones (defined in the Implementation), must have a data segment. If there is no data segment, a system error will occur.

General Format of Units:

The following example is designed to illustrate the general structure of a unit. The line numbers at the left of the page are for reference: they are NOT part of the actual structure.

Pascal II: Library units (2 of 2)

=====

```
1:  (*$S+*)
2:  UNIT < name >; INTRINSIC CODE xx DATA yy;
    (* DATA yy is used only if a data segment is
       required. *)

3:  INTERFACE

4:      USES < name of unit to be used >;
        CONST < definitions >;
        TYPE < definitions >;
5:      VAR < definitions >;

6:      PROCEDURE ONE (I:Integer);
        PROCEDURE TWO (I:Integer);
            (* External procedure *)
        FUNCTION THREE (I:Integer) : Integer;
        FUNCTION FOUR (I:Integer) : Integer;
            (* External function *)

7:  IMPLEMENTATION

8:      CONST < definitions >;
        TYPE < definitions >;

9:      VAR < definitions >;

10:     PROCEDURE ONE;
        BEGIN
            END;

        PROCEDURE TWO; EXTERNAL;

        FUNCTION THREE;
            BEGIN
                END;
```

```
FUNCTION FOUR; EXTERNAL;
```

```
11:  BEGIN
      (* initialization section *)
      END.
```

DISCUSSION

1: The swapping option is required when compiling ANY unit, regardless of its size. Omitting this option is the most common cause of compiler failures when working with units. The option should be the first line of text, preceding the UNIT header and any other compiler option.

2: The word INTRINSIC is required if the unit is to be intrinsic. DATA is optional, used only if a data segment is necessary (see #5 below). Regular units use only the UNIT < name > portion of this line.

3: INTERFACE is required. It defines the start of this section, which must contain some entries. (A totally empty INTERFACE section is not allowed.) This section contains the information which is public to both the host program and the unit (and visible from the LIBMAP program).

4: These entries are optional. If used, they are public (see #3). If a nested unit is used, it MUST be declared at this point, and the host program must also declare it in its USES statement before declaring this unit. (See pages 75-81 in the Pascal Language Reference Manual.)

5: VARs are also optional. If VARs are used in an intrinsic unit, a DATA segment MUST be declared, since these are global variables.

6: These are the public statements of the unit's procedures and functions. All parameters MUST be declared in this section, and must not appear in the IMPLEMENTATION. EXTERNAL may not be specified at this point (see #10).

7: IMPLEMENTATION is required. This section contains the code-generating statements and any private types or variables to be declared. If an item is declared in this section only, it is local to the unit and cannot be accessed from the host program directly; it is also not visible to LIBMAP.

8: CONST and TYPE definitions are optional. If included at this point, they are private and will not be visible to the calling program.

9: VARs are optional, and are private if defined at this point. A DATA segment is required if global VARs are specified in the IMPLEMENTATION section of an intrinsic unit, even though they are private.

10: These are the actual code-generating procedures. Procedures and functions already declared in the INTERFACE section need not have parameters listed here, since that would be redundant. EXTERNAL references are specified at this time.

11: This is the initialization section. Code in this portion is optional, but the BEGIN and END statements must always be present. The final END

statement must be followed by a "." to indicate the end of the text. Code placed in the initialization section will be executed immediately upon access to the unit (through the USES statement in the host program), and ignored thereafter. An example of this is Turtlegraphics, where the initialization code is responsible for allocating the high-res page so that variables will not be lost.

Pascal: Error Numbers--Runtime Pascal

=====

Apple has a special version of Pascal for applications programs that doesn't require a Language Card: it's called Runtime Pascal. Any errors that the programmer doesn't catch will stop the program with an error number equal to the error number from page 280 of the Apple Pascal Operating system Manual plus 100. For example, a 'file not found' error would cause error 110.

Pascal: Interrupts

Revised: 11/21/84
Security: Everyone

Pascal: Interrupts

=====

Pascal 1.1 will work with interrupts. Usually, interrupts are disabled when Pascal boots and the IRQ vector at \$FFFE,FFFF points to the system re-initialization routine. You can write an assembly language routine that will point the IRQ vector to your interrupt handler, and thereby enable interrupts. Refer to the Language Card manual for how to write to the IRQ vector.

The disk routines in Pascal 1.1 are protected from interrupts during their time-dependant code. However, Pascal 1.0 doesn't protect its disk routines; interrupts are therefore not recommended in that environment.

Pascal: Turtlegraphics -- Circles

Revised: 11/21/84
Security: Everyone

Pascal: Turtlegraphics -- Circles

=====

The program below is supposed to draw a circle, but it doesn't--it draws an octogon. The drawing routines can calculate exactly where the end of the line will be, but with a move of only one dot, the result is limited to one of the eight adjacent dots. For example, if we move a distance of one dot at an angle of five degrees, then the co-ordinates of the destination are $X + 0.09$, $Y + 0.99$, which are rounded to $X + 0$, $Y + 1$.

Calculated Angle	Actual Angle
0 - 22.5	0
22.5 - 67.5	45
67.5 - 112.5	90
112.5 - 157.5	135
157.5 - 202.5	180
202.5 - 247.5	225
247.5 - 292.5	270
292.5 - 337.5	315
337.5 - 382.5	0

The next table gives the calculated and actual X and Y coordinates for an angle of 5 degrees and varying move distances.

Move	X-Coordinate		Y-Coordinate	
	Calc	Act	Calc	Act
1	0.09	0	0.99	1
2	0.17	0	1.99	2
3	0.26	0	2.98	3
4	0.35	0	3.98	4
5	0.43	0	4.98	5
6	0.52	1	5.97	6

The next diagram simulates the High-Res graphics display. Clearly, you must move at least 6 units for 5 degrees to show any effect.

M o v e
1 2 3 4 5 6

```

                                     *
                                   *
                                *
                             *
                          *
                       *
                    *
               *
          *
      *
  *
```

As you can see, the computer can't display a 5 degree change unless the move is at least 6 units.

Apple Tape Backup 40SC Description, Compatibility (Discontinued)

Revised: 5/3/94
Security: Everyone

Apple Tape Backup 40SC Description, Compatibility (Discontinued)

=====

Article Created: 12 October 1987
Article Reviewed/Updated: 3 May 1994

TOPIC -----

This article describes the Apple Tape Backup 40SC.

DISCUSSION -----

The Tape Backup 40SC is a block-type device: data is written to, and read from, the tape cartridge in blocks. The controller module provides all data handling functions for SCSI bus transfers and tape cartridge Read/Write module controls, Read-Write head positioning, end sense, and analog-to-digital, digital-to-analog (ADC/DAC) signal conversion for the tape cartridge. The drive and Read-Write modules perform their functions under the direction of the controller module.

Writing to the tape unit begins with the user's command to back up a storage device such as a hard disk. Backup utility software loaded into the Macintosh receives this command and begins transferring data from the storage device to a range of Macintosh main memory. The software then passes control and the address in main memory of the data being transferred (buffer address) to the Macintosh SCSI firmware.

Using standard SCSI commands, the SCSI firmware gives the controller module the logical address to write the incoming block to the tape unit. The controller module translates the logical address to a physical address on the tape, and sends the Read-Write and drive modules commands to position the Read-Write head and activate the tape transport. The incoming data blocks are buffered in the controller module during this translation, but then are passed to the Read-Write module for writing through the control module interface. The Read-Write module then performs the actual write operation according to the commands sent to it by the controller module. The controller module uses the standard SCSI protocol to tell whether the write was successful.

Reading from the tape backup unit begins when the user issues a command to

recover a backup file. The backup utility software receives this command and sets up a range of Macintosh main memory (a buffer) to receive the incoming file. The software then passes control (and the buffer address in main memory) to the Macintosh SCSI firmware.

To read from the tape unit, the Macintosh SCSI firmware sends the controller module the logical address of the target block, using the standard SCSI commands. The controller module translates the logical address to a physical address on the tape cartridge and sends the Read-Write and drive modules the commands to position the Read-Write head and activate the tape transport. The outgoing data blocks are passed to the controller module through the control module interface. They are buffered in the controller module and then passed to the SCSI controller for output onto the SCSI bus. The controller module acknowledges correct (or faulty) execution of the read operation to the Macintosh software through the standard SCSI protocol.

The SCSI firmware in the Macintosh receives the data sent by the controller module and writes it to the previously allocated buffer. The controller module, however, acknowledges correct operation as soon as it has passed the data blocks on to the SCSI bus, regardless of the success or failure of the SCSI firmware's side of the exchange.

IMPORTANT COMPATIBILITY NOTES:

- The Tape Backup 40sc is compatible with type DC 2000 tape cartridges.
- The bundled software included with the Tape Backup 40SC is Tape Backup 40SC 2.0.1, which is INCOMPATIBLE with System 7 and later.
- Apple recommends using third-party backup software with the Tape Backup 40SC. Some products that work with the Tape Backup 40SC are Retrospect and Retrospect Remote from Dantz Development Corp., and FastBack Plus from Fifth Generation Systems.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

Article Change History:

- 3 May 1994 - Revised article, added information regarding the type of backup tapes which can be used.
- 27 September 1993 - Revised article, adding current compatibility information.
- 23 September 1987 - Reviewed for technical accuracy.

Revised: 11/21/84
Security: Everyone

Pascal II: High-res Character Set

=====

SYSTEM.CHARSET is used by the WCHAR and WSTRING procedures in Turtlegraphics to write textual information on the High-Res Graphics screen. It's a file of 1024 bytes, arranged in a sequence of 128 X 8 bytes in order to represent the ASCII character set. Each character is drawn from bottom to top; e.g., byte 0 is the bottom line of dots in the character. Drawblock uses these characters, so they should be accessed and treated as any other drawblock unit.

LaserWriter: Loose Screws Cause Printing to Stop

Revised: 10/12/87
Security: Everyone

LaserWriter: Loose Screws Cause Printing to Stop

=====

This article last reviewed: 23 September 1987

Near the microswitches inside the LaserWriter, there is a bracket held in place by two screws (but no lock washers). As old toner cartridges are removed and new ones installed, these screws and the bracket become loose. This causes the toner cartridge to 'disappear to the LaserWriter' as the drive train tightens to pull the paper through, causing the LaserWriter to stop printing.

When printing stops, the tension in the drive train slackens and the toner cartridge 're-appears'. This series of events results in what appears to be a paper jam. At first, this can happen about once a week. Then it begins to happen every day. Eventually, the bracket becomes so loose that the cartridge 'disappears' entirely.

To fix the problem, just adjust the bracket and tighten the screws.

Pascal: Reading DOS 3.3 Diskettes

Revised: 11/21/84
Security: Everyone

Pascal: Reading DOS 3.3 Diskettes

=====

Both Pascal and DOS 3.3 use the same recording format on the diskettes. Pascal can read a DOS diskette with the UNITREAD procedure, but there is a hitch: Pascal uses 512 byte blocks, while DOS uses 256 byte sectors. The following table shows the correspondence between Pascal's block number and DOS's track and sector numbers. Columns 4 and 5 refer to bytes 0..255 of the block and columns 2 and 3 refer to bytes 256..511.

(1) BLOCK	(2) TRACK	(3) SECTOR	(4) TRACK	(5) SECTOR
6	1	0	1	E
7	1	D	1	C
8	1	B	1	A
9	1	9	1	8
10	1	7	1	6
11	1	5	1	4
12	1	3	1	2
13	1	1	1	F
14	2	0	2	E

The rest of the disk is arranged the same, except that the track number increases.

Pascal: Error Messages

Revised: 11/21/84
Security: Everyone

Pascal: Error Messages

=====

--> "ERROR: WRITING OUT THE FILE. PRESS <SPACEBAR> TO CONTINUE."

This message can be generated in one of three ways:

1. File names are restricted to 10 characters, not including the volume name prefix or the .TEXT suffix; a name longer than that will generate the error immediately without accessing the disk drive.
2. The error will be generated if there is insufficient room on the root disk to save the new file. This condition is particularly prone to occur when Pascal is updating the workfile, since Pascal always saves the new copy of the file before removing the previous copy.
3. The directory is limited to 77 entries. If you try to save a 78th, the error will be generated, even if there is enough room on the disk for the file.

--> "NO ROOM ON VOLUME" or "CODE WRITE ERROR"

These messages may be displayed if there isn't enough room to write the file to the specified volume. This error can occur in the Filer, Compiler, Assembler, or Linker, and can usually be corrected either by using the Filer "Krunch" option (to consolidate unused blocks) or by removing unnecessary files.

--> More on "CODE WRITE ERROR"

During creation of a code file on the boot disk, the Assembler creates a temporary file called LINKER.INFO on the boot disk; this file stores linkage information that is later written into the final block of the code file. If the code file is directed to the boot disk during the assembly, the largest unused block of disk space is opened for the code file. If the disk has been Krunched recently, there may be no space available for opening LINKER.INFO, in which case the "CODE WRITE ERROR" message will be displayed. To rectify the problem, simply "Make" an 8-block file on the boot disk, and then Make a

1-block file. (The names of these files are unimportant). After that, R)emove the 8-block file, thereby separating the space into two distinct areas and creating a place for LINKER.INFO to live. NOTE: This error may also occur in the Compiler, since the Compiler also creates a LINKER.INFO (though only during very large compiles when the system needs to temporarily swap out information). The fix is the same.

If an error occurs when you use the include file option, "Make" a 4-block file on the volume where the compiler resides, and name it SYSTEM.SWAPDISK. Doing so makes it possible for the Compiler to swap out some information in order to read in the new directory in preparation for the include file.

The Pascal (version 1.0) compiler error #407 ("Too Many Libraries") can usually be avoided by changing the length of the text file being compiled. The problem is corrected in Pascal version 1.1.

Tech Info Library Article Number:712

Tech Info Library

Pascal II: Compiler Options

Revised: 11/21/84
Security: Everyone

Pascal II: Compiler Options

=====

The Pascal compiler swapping option (*\$S+*) should be used if the compile fails due to lack of symbol table space. This option should be the first line of the text, preceding the program statement. Swapping MUST be used in compiling units. Please see page 68 of the Apple Pascal Language Reference Manual for more details.

The Pascal compiler list option (*\$L+*) should not be used with Pascal version 1.0, since this will result in the loss of the code file and possibly of the directory. Instead, direct the list to the printer (*\$L Printer:*), the console (*\$L Console:*), or to a named file ON ANOTHER VOLUME: for example, (*\$L Mydisk:Myfile.text*). We recommend using the printer. NOTE: This problem has been corrected in Pascal 1.1, and will work as described in the Pascal reference manuals.

The (*\$U-*) "lex level" compiler option will result in a non-executable codefile and so should not be used for compiling user programs. This option is intended for working on the system level; it requires files and information not available to the user.

Compiler options in Pascal version 1.0 must be in capitals. In version 1.1, capitals and lower case are interchangeable.

Apple 300/1200 Baud Modem: No Eight-Bit Command

Revised: 8/3/89
Security: Everyone

Apple 300/1200 Baud Modem: No Eight-Bit Command

=====

This article last reviewed: 23 September 1987

The Apple 300/1200 baud modem supports data formats up to 8 bits. There is no command to change the data handling of the modem from 7 bits to 8 bits. When data is sent to the modem, as a series of level transitions, the modem simply converts those transitions to frequency shifts. It does not care what the data structure is, up to the specified limits, and will echo whatever is sent to it.

Pascal: Difference between REPEAT..UNTIL and WHILE..DO

Revised: 11/21/84
Security: Everyone

Pascal: Difference between REPEAT..UNTIL and WHILE..DO

=====

Pascal supports two forms of conditional loop: REPEAT..UNTIL and WHILE..DO.
A loop of the form

```
REPEAT  
UNTIL <condition>
```

will be executed at least once, even if the condition is satisfied before the first execution.

The loop consisting of

```
WHILE <condition> DO
```

will be executed ONLY if the condition is satisfied when the loop is entered.

Lisa Basic+ 2.0

Revised: 11/9/88
Security: Everyone

Lisa Basic+ 2.0

=====

This article last reviewed: 9 November 1988

You might expect the German umlaut, not a standard ASCII character, to get the interpreter to generate a syntax error. Instead, the system hangs as if it were in an infinite loop; use the "pc 0" in the debugger to return to the command line. Avoid using option characters within the program text.

If a missing "&" in a multiline statement generates a syntax error instead of a system hang, something else may be wrong with the statement or with the system itself.

The renumbering of embedded numbers in 'REM' statements is often unsuccessful. Usually, the problem is that the number embedded in the 'REM' statement is both (a) the same as a line number in the program before or after the 'REM' statement itself, and (b) also a number that would be used in the renumbered sequence.

Lisa Basic+ supports two types of arrays, virtual and non-virtual (i.e. resident in memory). Both virtual and non-virtual arrays contain a limited number of elements: 2730 for real arrays and 16383 for integer arrays. (See the Basic+ User's Guide, page 9-2.) The system allocates a maximum of 32K of system memory to each non-virtual array dimensioned. Use the "LENGTH" command to tell you how much memory is available. With that amount, calculate the number of arrays you can dimension within the specific program.

Virtual array files (disk based) as well as arrays within the file can occupy more space than the available system memory. An example:

The maximum number of non-virtual arrays of maximum size with 504K of available memory is 16. Yet, if the program utilizes virtual arrays, the number of arrays that can be dimensioned is limited only by the amount of free disk space.

You can delete a file from within a basic program using the system statement 'Kill'. Refer to page 14-3 in the Basic Language manual for more details.

To transfer files with the file-manger to Slot 2 Channel 2:

- 1) press f for file-manager.
- 2) press t for Transfer.
- 3) in response to:
 WHERE?
 type -slot2chan2-

APPLE-. does terminate a LisaBasic program at the next logical stopping point; you can cause the program to resume by typing CONT. (Refer to page 3-11 in the Basic Language manual for details.) This method will NOT work, however, with a system hang due to, for instance, as an infinite loop; in such a case, you must implement the debugger in order to escape.

Macintosh: What is the Resource Manager?

Revised: 12/17/84
Security: Everyone

Macintosh: What is the Resource Manager?

=====

The Resource Manager, one of the cornerstones of Macintosh's ROM-based user Interface Toolbox, was designed and implemented by Bruce Horn, a member of the Macintosh software team. It provides a way for applications to separate their code from the data they use--to keep the data, such as prompt strings, menus or icons, in a separate, structured part of the file. This allows the data to be edited by a utility program without any specific knowledge of that application.

Since all of the language-dependent parts of an application are resources, an application may be translated to another language (French, German, etc.) in a matter of hours by a nontechnical translator without access to the source code. Similarly, users with this utility program can customize the prompts and phrases in an application to suit their particular tastes.

The Resource Manager has proven so useful that now many other parts of the system use it in one way or another. Desk accessories, code segment, fonts, icons, windows, menus, controls, and dialogs are all kept as resources.

LisaCalc 3.0: Problems Handling Large Documents

=====

LisaCalc has difficulty handling documents over 400 blocks long. If you try to build a file that large, an error may occur after you save and put away the document. If you attempt to redisplay it, you may see a dialog box saying "Unable to Redisplay the Document."

These problems have been fixed in Lisa Office System Release 3.1. The new LisaCalc size limit is approximately 700 blocks (350K). Larger documents still require much more time to calculate, update, print, and save.

AppleWorks: Using With Wide Carriage ImageWriter

=====

This article last reviewed: 28 September 1987

AppleWorks can print over the entire width of the Wide Carriage ImageWriter's platen. How you do it depends on whether you're using AppleWorks' word processor, database, or spreadsheet module:

- In the word processor or spreadsheet, press Open-Apple-O, set PW (platen width) to 13.2, and press Escape.
- In the database, press Open-Apple-O when in a Report Format and set PW (Platen Width) to 13.2.

To print the maximum number of characters per line, change the Characters per Inch setting to 17. This allows up to 224 characters per line.

LisaWrite: Disappearing Text

Revised: 10/8/84
Security: Everyone

LisaWrite: Disappearing Text

=====

On rare occasions, lines or possibly even pages of text may disappear from the screen of a LisaWrite document for no apparent reason. If the text has been cut, merely paste it back into the document. If the text hasn't been cut, open the page layout menu and select Don't Preview Pages. Your missing text should reappear after you select Save and Continue from the File Print menu.

There are also rare occasions when a line of text may not be printed at the bottom of a page. Selecting Save and Continue should correct the problem. If it doesn't, adjust the paragraph spacing in the line (with the Format menu) or insert a page mark (with the Page Layout menu), and then repeatedly choose Save and Continue until the line prints successfully.

ImageWriter Family & Scribe: Connecting To An IBM PC, PS/2, AT&T

=====
This article last reviewed: 11 April 1990

TOPIC-----

What are the cable and printer configurations that will interface an IBM PC, PS/2, AT&T 6300 or other IBM compatible to an ImageWriter I, ImageWriter 15", ImageWriter II, LQ or Scribe printer.

DISCUSSION-----

Cabling pinouts for a custom cable:

IBM PC (use female DB-25)	ImageWriter II or ImageWriter LQ (use circular 8 connector)
5,6 (CTS, DSR)	1 (DTR)
20 (DTR)	2 (DSR)
3 (RxD-)	3 (TxD-)
7 (SG)	4,8 (SG, RxD+)
2 (TxD-)	5 (RxD-)

IBM PC (use female DB-25)	ImageWriter/15"/Scribe (use male DB-25)
3 (RxD-)	2 (TxD-)
2 (TxD-)	3 (RxD-)
5 (CTS)	4 (RTS)
7 (SG)	7 (SG)
6 (DSR)	20 (DTR)

Reference:

RS232 Signal (DB-25 DTE)
1 - Sig Gnd - Normally Shield or Chassis Ground

2 - TXD	- Transmit Data
3 - RXD	- Receive Data
4 - RTS	- Request to Send
5 - CTS	- Clear to Send
6 - DSR	- Data Set Ready
7 - GND	- SIGNAL Ground
8 - DCD	- Data Carrier Detect
20 - DTR	- Data Terminal Ready
22 - RI	- Ring Indicate

Set printer switches to the following settings for this configuration:

U.S. Character set,
66 lines per page,
8 data bits (1 stop bit, no parity),
pica character pitch,
no LF after CR,
9600 Baud,
Data Terminal Ready Protocol.

ImageWriter I Switch Settings:

	8	7	6	5	4	3	2	1	
SW 1:									(CLOSE)
	X	X	X	X	X	X	X	X	(OPEN)
SW 2:				4	3	2	1		
						X	X		(CLOSE)
						X			(OPEN)

ImageWriter II Switch Settings:

SW 1 :	1	2	3	4	5	6	7	8	
	X	X	X	X	X	X	X	X	(OPEN)
									(CLOSE)

SW 2:	1	2	3	4	5*	6*			
			X	X					(OPEN)
		X	X						(CLOSE)

* NOTE: DO NOT CHANGE SWITCH 5 AND 6.

ImageWriter LQ Switch Settings:

SW 1:	1	2	3	4	5	6	7	8	
	X	X	X	X	X	X	X	X	(OPEN)
									(CLOSE)

SW 2:	1	2	3	4	5	6	7	8	
	X	X	X	X	X	X			(OPEN)

X X

(CLOSE)

SW 3: DO NOT TOUCH!

Finally, configure the serial port of the computer to match the printer configurations as above and assign the port to LPT1 by running this autoexec program:

```
mode COM1:96,N,8,1,P
```

```
mode LPT1:=com1
```

ProDOS: Setting the prefix before using the CONVERT Program

Revised: 10/23/84
Security: Everyone

ProDOS: Setting the prefix before using the CONVERT Program

=====

The ProDOS User's Disk, /USERS.DISK, contains a CONVERT Program that transfers DOS files to ProDOS disks. For these transfers, users must remember to set the ProDOS prefix (in this case, volume name) to the prefix of the disk to which they want to send files. The ProDOS prefix defaults to the prefix of the startup disk (/USERS.DISK in this case). At the beginning of the transfer, the system checks for the correct type of disk (ProDOS or DOS 3.3) and the prefix of the ProDOS disk; if you've forgotten to change the prefix, you will receive the message "No Room on Volume" (namely, /USERS.DISK). Select option "P" from the CONVERT main menu, change the prefix, and all will be fine.

A Tip: Writing the volume name on the label of each of your ProDOS disks will help you to remember that you must provide CONVERT with the disk's prefix.

Macintosh: Typesetting with TeleTypesetting's MicroSetter

=====

This article last reviewed: 30 September 1987

MicroSetter, from the TeleTypesetting Company, converts Macintosh documents into a form acceptable to Varityper typesetting machines. The product includes the MicroSetter desk accessory, cables, conversion software, and connectivity software.

MicroSetter can connect to both digital and non-digital Varitypers. In the case of digital Varitypers, a "ruling" option lets the user typeset rules, boxes, and graphics from MacPaint-type applications.

MicroSetter can handle documents created by Ready,Set,Go, Page Maker, Microsoft Word, MacWrite, and MacDraw. (Graphics from Quark XPress and Cricket Draw are not compatible with MicroSetter.)

The MicroSetter desk accessory is used in two ways:

- to convert a document to Varityper format,
- then to send the document to the Varityper.

The Varityper can't generate all the text and graphics that the Macintosh can. A non-digital Varityper can do text only. And a digital Varityper can't do screen fill patterns, rotated type, circles, or arcs (but with the "ruling" option can handle text, bit-mapped graphics, lines, and boxes).

Apple IIGS: Disk Drive Slot Assignments

Revised: 10/12/87
Security: Everyone

Apple IIGS: Disk Drive Slot Assignments

=====

This article last reviewed: 23 October 1986

Depending on the operating system and the available combination of drives, the Apple IIGS can use disk drives in a number of different slot assignments. Below are some guidelines for determining the slot assignments.

Under DOS, ProDOS 1.1.1, ProDOS 1.2 (ProDOS 8), and ProDOS 16, you may use the slot number to refer to hard drives and floppy drives using an interface card. Disks may also be called by ProDOS pathnames without regard to slot locations.

The Apple IIGS SmartPort, controlled by the firmware in the IIGS, includes the internal RAM disk and ROM disk as well as any external drives connected to the SmartPort. These drives are referenced in slot 5 because the IIGS takes SmartPort to be slot 5. There are exceptions in the use of the SmartPort: it's not available under DOS or ProDOS 1.1.1.

ProDOS 1.2 (ProDOS 8) permits up to four devices connected to the SmartPort. If four drives are found on the SmartPort, the first two drives are considered to be in slot 5 (drives 1 and 2), and the last two drives are "found" in slot 2 (drives 1 and 2). If the RAM disk is active, it occupies slot 5, drive 2, and remaining drives are moved down in the sequence to slot 2, drive 1 and slot 2, drive 2, if necessary.

ProDOS 16 allows the SmartPort up to six devices, all found in slot 5; if activated (from the Control Panel), the RAM disk occupies slot 5, drive 2. If both RAM and ROM disks are both activated, the ROM disk will be found immediately after the RAM disk. If RAM and ROM disks are available and if only the ROM disk is activated (from the Control Panel), the ROM disk will be found in drive 2.

AppleWorks: File guidelines for versions 1.1, 1.2, and 1.3

=====

I. General File Guidelines:

- A. Maximum number of AppleWorks files per Root Directory: 51.
- B. Maximum number of files in ProDOS subdirectory created by AppleWorks: 51.
- C. Maximum number of AppleWorks files allowed on AppleWorks' Desktop: 12.
- D. Guidelines for file names:
 - 1. 15 characters maximum.
 - 2. The name must start with a letter.
 - 3. The name must contain only:
 - a. uppercase and lowercase characters,
 - b. numbers,
 - c. spaces, and
 - d. periods.
- E. Maximum number of characters in the file is limited by disk size.

II. Data Base File Guidelines:

- A. Maximum number of records, regardless of record size or number of categories: 1350
- B. Maximum number of records in a file, assuming a record size of 75 characters and given the following RAM and Desktop:
 - 1. 140 with 64K RAM (10K Desktop)
 - 2. 750 with 128K RAM (55K Desktop)
 - 3. 13,817 with 128K RAM and full RAM card (1012K Desktop),

version 1.3 ONLY

C. Maximum number of categories per record: 30

D. Maximum length of a record: 1024 characters

-- It is only possible to reach this limit if you use field names of one character.

E. Maximum length of an entry: 76 characters

F. Maximum number of characters in a category name: 20

III. Word Processor File Guidelines:

A. Maximum length of a Word Processor file: 2250 lines by 79 characters

B. Maximum number of characters in a file, given the following RAM and Desktop:

-- The page counts have been calculated using a line length of 79 characters and a page length of 54 single spaced lines.

1. 10,000 characters with 64K RAM (10K Desktop),

-- 3 pages approximate minimum

2. 56,000 characters with 128K RAM (55K Desktop),

-- 13 pages approximate minimum

3. 177,750 characters with 128K RAM and full RAM card (1012K Desktop), version 1.3 ONLY

-- 41 pages approximate minimum

IV. Spreadsheet File Guidelines:

A. Maximum empty cells: 126,873 (127 columns and 999 rows)

B. Rows: numbered 1 through 999

C. Columns:

1. A through Z (1-26)

2. AA through AZ (27-52)

3. BA through BZ (53-78)

4. CA through CZ (79-104)

5. DA through DW (105-127)

D. Maximum filled cells:

1. Maximum number of cells in a file, assuming a cell size of ONE NUMBER and given the following RAM and Desktop:
 - a. 930 with 64K RAM (10K Desktop)
 - b. 5,120 with 128K RAM (55K Desktop)
 - c. 94,208 with 128K RAM and full RAM card (1012K Desktop),
version 1.3 ONLY
2. Maximum number of cells in a file, assuming a cell size of ONE CHARACTER and given the following RAM and Desktop:
 - a. 2,560 with 64K RAM (10K Desktop)
 - b. 14,080 with 128K RAM (55K Desktop)
 - c. 126,873 with 128K RAM and full RAM card (1012K Desktop),
version 1.3 ONLY

Article Created: 23 October 1984
Article Last Reviewed: 1 June 1992
Article Last Updated:

To see the clock, choose Alarm Clock from the Apple Menu. A single box displaying the time will appear on screen. Clicking on the flag to the right of the time will bring up two more boxes under the time display. The bottom box contains icons for the alarm, date, and time; the middle box contains the setting for the icon selected in the bottom box.

To set the alarm, date, or time:

1. Choose Alarm Clock from the Apple Menu.
2. Click on the flag to the right of the time display. The setting and icon boxes appear.
3. Click in the bottom box on the icon for the setting you want to change.
4. Click in the middle box. Scroll arrows appear.
5. Click in the middle box on the setting you want to change. To change the setting, click on the scroll arrows or type the new setting.
6. Set the clock by clicking on another icon or clicking on the Close box in the upper left corner of the time display.

When you select the alarm icon, an on/off switch icon shows up on the left of the alarm setting in the middle box. Small lines radiate from the alarm icon in the bottom box when the alarm is on. When the alarm goes off, the speaker beeps once and the Apple menu flashes.

When the Apple on the Menu bar is flashing, it means that the alarm has gone off. To turn off the alarm, choose the Alarm Clock from the Apple menu; if the clock is on screen, get to the clock's icon box and click on the date or time

icon.

Macintosh: How To Change "Number Of Copies" Default

=====

Article Created: 17 December 1987
Article Last Reviewed: 5 November 1991
Article Last Updated: 18 October 1988

TOPIC -----

Here's how to change the Print Manager's "Number of Copies" value from its default of 1.

DISCUSSION -----

Note: ResEdit is a resource editor available from APDA, the Apple Programmer's and Developer's Association.

1. Use ResEdit to open the LaserWriter or ImageWriter file in your System Folder.
2. Change the "Copies:" field in DITL resource -8191. Change the number from 1 to whatever number you like.
3. Save the change when you quit ResEdit.

Catalyst 2.0: Apple Writer III 2.0 installation

Revised: 10/23/84
Security: Everyone

Catalyst 2.0: Apple Writer III 2.0 installation

=====

Catalyst's Automatic Install exhibits problems when installing Apple Writer III version 2.0 on the ProFile. The problem usually manifests itself with a stack overflow (System Error \$06) upon selecting the menu option.

Quark is not sure of what the problem is, but it appears that the person adding Apple Writer III to the Catalyst Menu must have both the Catalyst Master and Catalyst Backup diskettes on hand when doing the installation. As the automatic install program runs, it needs the Catalyst Backup diskette and displays a request for it. Do not ignore this request during the installation. If you do try to bypass this step with the Escape key, the installation seems to proceed normally--yet Apple Writer does NOT install and generates a Stack Overflow error whenever you select Apple Writer III from the Catalyst menu.

MousePaint: Printing

Revised: 4/11/91
Security: Everyone

MousePaint: Printing

=====

Article Created: 23 October 1984
Article Last Reviewed: 11 April 1991
Article Last Updated: 11 April 1991

MousePaint was designed as a black and white program, not a color program. While MousePaint will output to the Scribe in color, the quality is poor. The current version of MousePaint prints directly to Apple dot matrix printers only.

Meanwhile, for printing to third party printers such as Epson or Okidata, here are some indirect methods.

NOTE: All procedures reviewed here use the ProDOS /USERS.DISK that comes with the ProDOS supplied with Disk II's or with the ProDOS User's Kit.

1. Using an intelligent graphics interface: Grappler, Pkaso, or other.
 - A. Save the picture by selecting the "Put a copy in..." command from the MousePaint File menu. This will create a standard binary picture file on a ProDOS-formatted data disk.
 - B. Leave Paint.
 - C. Start up Applesoft BASIC using the ProDOS /USERS.DISK. BASIC is an option on the main ProDOS menu.
 - D. Now you must instruct your Apple to load the graphics image and to tell the interface to dump it to the printer. Most graphics interfaces come with examples of programs that do this. Enter and save one of these on your ProDOS data disk.

Sales Tip: Enter the programs for the intelligent interfaces you support. Make sure they run under ProDOS and give them to your customers.

2. Using a "snapshot" interface.

Some cards, e.g., the "PRINT IT" interface, will print the screen when a button is pressed. Because you would print the Paint palette if you did a MousePaint screen dump, you should save the graphic as above and start up

BASIC from the ProDOS /USERS.DISK. Then give these direct commands to your Apple:

```
HGR:POKE -16302,0  
BLOAD picturename, A$2000
```

Then press the interface's button to dump the picture.

3. Making your Apple do the work.

This works if you have a graphics printing program that works with your printer, e.g., Printographer, Zoom Grafix, Apple LOGO Tool Kit and so on. Most of these programs run under DOS 3.3.

- A. Follow the instructions above to store a binary file on your ProDOS data disk.
- B. Start up the ProDOS /USERS.DISK.
- C. Now you must convert the binary file over to DOS 3.3 format using the CONVERT option on the ProDOS menu. Follow the instructions in the ProDOS manual for doing this conversion. (See our article on using the ProDOS CONVERT program for more information).
- D. After the file is converted to DOS 3.3, it may be loaded and dumped by your DOS 3.3 graphics program.

Of course, once these programs are published under ProDOS, you will not need to convert the binary file before using the graphics program.

To dump graphics, Apple IIc users can also employ the Imagewriter Tool Kit, Revision B, which works under ProDOS.

ImageWriter and Dot Matrix Printers: Setting Page Lengths

Revised: 8/10/87
Security: Everyone

ImageWriter and Dot Matrix Printers: Setting Page Lengths

=====

You can set custom page lengths for the Imagewriter and Dot Matrix printers by sending a string of continuous text to the printer. This string sets the number of printed lines per page and the number of lines between the current BOF (bottom of form) and the following TOF (top of form). The commands that need to be entered are as follows:

COMMAND STRING	DECIMAL EQUIVALENT	FUNCTION
control]A@	29 65 64	Set TOF

@@ 64 64

At this point you would enter the command @@ for each printed line of text, less two. For example, to set a length of 44 lines, you would enter the string @@ 42 times with no spaces.

C@	67 64	Set BOF
----	-------	---------

@@ 64 64

At this point you would enter the command @@ for each line between the current BOF and the next TOF. For example, if you need to skip 10 lines to bring you to the next TOF, then you would enter the string @@ 10 times.

A@control^	65 64 30	Set TOF Next Page
------------	----------	----------------------

A program to produce these strings will ensure the needed accuracy in the character string. Once the page length has been set, it will remain in effect until the printer power is turned off. If you need more information, refer to the Imagewriter and Dot Matrix Printer Reference Manuals under the headings of Setting Page Length and Vertical Tabbing.

Macintosh: Advanced Cut & Paste Tips for Multiplan & MS-BASIC

Revised: 2/11/88
Security: Everyone

Macintosh: Advanced Cut & Paste Tips for Multiplan & MS-BASIC

=====

This article last reviewed: 23 October 1984

A limited number of fonts are available in Multiplan; it does, though it have several print options, including (a) printing with or without coordinates, (b) printing with or without cells, and (c) printing in condensed or draft form. If you wish, you can vary the font used in Multiplan by moving the text into a MacWrite document:

1. Simply cut or copy the desired cells.
2. Quit and eject Multiplan.
3. Without rebooting, insert the MacWrite disk.
4. Start up an application.
5. Paste in your model.
6. Customize the type style of the text as you wish.

MacPaint also accepts graphics created in MS-BASIC. To move such a document into MacPaint:

1. Enlarge the MS-BASIC output window to its full extent.
2. Run your graphics program.
3. Key in SHIFT-COMMAND-3. This dumps the screen to disk.
4. Open and modify the resulting Screen file in MacPaint.
5. Move the MacPaint document to MacWrite.

Though the MS-BASIC editor only uses the clipboard for single lines, MS-BASIC programs can write many lines of text to the Clipboard. At present, MS-BASIC does not write graphics to the Clipboard, but it does have text-only access to the Clipboard's facilities through the device name CLIP:. Here is a pair of programs to demonstrate the use of CLIP:; note that the programs do file I/O with text created by the program.

```
10 REM Writes to Clipboard
20 Open "CLIP:" for output as #1
30 For i=1 to 10
40 Write#1: ,"Hi, I'm Macintosh!"
```

```
10 REM Gets data from Clipboard
20 Open "CLIP:" for input as #1
30 While not EOF (1)
40 Input #1,A$
```

50 Next i	50 Print A\$
60 Close #1	60 Wend
70 Close #1	

You can also use MS-BASIC to manipulate Multiplan data. The working solution elaborates upon the Clipboard example shown above. See Appendix H of the MS-BASIC manual for more details.

Macintosh: Microsoft BASIC program merging

=====

When merging MS-BASIC programs with the MERGE command (see p. 119, MS-BASIC manual), care must be taken with the program to be merged with the program in memory: make sure that you have saved IN ASCII FORMAT the program to be merged. Make sure also that the line numbers of both programs do not overlap or repeat, because the MERGE function overwrites the lines in memory with lines from the disk file that have matching line numbers. To avoid the problem, renumber the program in memory with the RENUMB command described on p. 154 of the MS-BASIC manual.

Macintosh: Disk Recovery

Revised: 9/16/88
Security: Everyone

Macintosh: Disk Recovery

=====

This article last reviewed: 23 October 1984

At the outset, we recommend that you and your customers practice that time-honored tradition of backing up important files. Recently, however, we have gotten suggestions on reviving damaged Macintosh application disks and retrieving files from damaged data disks. Since there are many ways to blow up disk directories, though, these methods are not 100% effective.

Method one: Rebuild the desktop file.

1. If the disk is bootable (i.e. has a system folder on it), put the bad disk into the internal drive while the Macintosh is turned off.
2. Hold down the OPTION and COMMAND keys and turn the Macintosh on.
3. While the Macintosh boots, hold down the OPTION and COMMAND keys until the disk icon appears.
4. If the disk is a data disk (i.e. no system folder on it) then boot the system with a good disk. When the data disk is inserted into the drive hold down the OPTION and COMMAND keys as above.

This method sometimes requires several attempts, and while it restores data files, file folders are lost on Finders prior to 4.1; they must be re-created, and the documents must be placed back into them manually. If the Finder is version 4.1 or greater then the folders lose their names and must be manually renamed.

Method two: Recovering files.

1. Boot the Macintosh with a good copy of the application needed to read the data files you wish to recover.
2. Create a new document in that application with a double click on the application's icon.
3. Once the document, usually called "Untitled", has opened, close it.
4. Select Open on the File menu.
5. Insert the bad disk.
6. Select Open again and try to read files off of the bad disk.

7. Save the files to a good disk.

This method also works faster if you use a second drive for reading data files.

Method three: Replacing System Files.

This method has been known to work with disks that fail to boot and exhibit a "Sad Macintosh" with the address 0F0064. First attempt Method one above. If that doesn't work, boot from a good disk and then insert the bad one. If the bad one appears on the desktop, then throw away the bad disk's System Files and replace them with new ones from the good disk.

Macintosh MacPaint: Fill

Revised: 2/11/88
Security: Everyone

Macintosh MacPaint: Fill

=====

This article last reviewed: 23 October 1984

Normally the MacPaint bucket allows for a single filling of a bounded area of a shape. If you wish to try various fills to see which looks best, select Undo on the Edit Menu after each fill.

The May 1984 Version 1.3 of MacPaint has a new Fill command on the Edit Menu. To use it, lasso an object and select Fill. The active fill pattern at the bottom of the palette will fill the entire object. There are no limitations on the number of times an object may be filled. The bucket still has its original limitations.

Often there is the need to put one outline shape on top of another and to have both shapes filled with the same pattern. This helps you to position objects and text, providing a "stop" every eight fatbits. The smallest square that may be created while the grid is active is nine by nine fatbits. Unlike the grid in LisaDraw, this grid is invisible and nonadjustable.

Macintosh: Cut from MacWrite and Paste to MicroSoft BASIC

=====

This article last reviewed: 23 October 1984

MacWrite files of MS-BASIC code can be turned into a program.

1. Leave MacWrite and open a new MS-BASIC document.
2. Type the MERGE command with the syntax, MERGE "volumename:filename", where "volumename" is the name shown under the disk's icon on the desktop and "filename" is the name you gave your MacWrite file.

See page 119 of the MS-BASIC manual for information about MERGE.

Note that if you stored text in more than one MacWrite document, you should repeat the command until you have MERGED the remainder of your files into the new BASIC program. The program will be named with the name of the last file you merged into it.

AppleWorks: Form feed problem with some third party printers

=====

At times, AppleWorks' Top-of-Form command does not work properly with some third party printers, including the Juki printer. If your printer seems to ignore AppleWorks' Top-of-Form command, follow this procedure:

1. Check the printer's Top-of-Page and Lines-Per-Inch settings.
2. Change AppleWorks' "Accepts Top of Page" to NO.
3. Turn off the printer.
4. Align the top of the form on the printer.
5. Turn on printer.
6. Proceed as usual.

Why the Macintosh Has No Parity Checking

Revised: 5/11/89
Security: Everyone

Why the Macintosh Has No Parity Checking

=====

This article last reviewed: 29 September 1987

Here's why Macintosh systems don't implement parity checking:

- Reliability. RAM is typically the most reliable component in our systems.
- Simplicity. Parity checking requires additional hardware overhead, which lowers reliability.
- Low chip count. The systems for which parity checking was originally designed required more chips for the same amount of RAM. RAM chips used in these older system were far less reliable than the chips used today.
- The Macintosh does a full read/write RAM test every time it is switched on. This test is a sufficient diagnostic.

Super Serial Card: Using Serial Multiplexer (12/96)

Revised: 12/16/96
Security: Everyone

Super Serial Card: Using Serial Multiplexer (12/96)

=====

Article Created: 23 October 1984
Article Reviewed/Updated: 16 December 1996

TOPIC -----

This article discusses using the Super Serial Card with a Serial Multiplexer.

DISCUSSION -----

To reduce costs, many schools install a Serial Multiplexer to allow many Apples to share an Imagewriter. The multiplexer scans each computer by sampling a signal called "Data Set Ready" or DSR from the Super Serial Card in each IIe.

The nature of the SSC causes a modem nullifier to map this signal to DTR, "Data Terminal Ready." Normally this signal is not turned off by the computer since other equipment, like a modem, requires this signal to remain on. In this configuration the Serial Multiplexer stops scanning and hangs if the signal is not dropped. A simple POKE in BASIC releases the line.

The general form is: POKE 49050+256*Slot,1

Example

Most systems have the SSC in slot 1, so the command is:

POKE 49306,0

HyperCard: Hanging Up The Phone

Revised: 3/1/89
Security: Everyone

HyperCard: Hanging Up The Phone

=====

Article Created: 10 February 1989
Article Last Reviewed: 5 June 1992
Article Last Updated:

When you use HyperCard's dial command with a modem, HyperCard doesn't hang up the phone right away if the line is busy. This is because the dial command simply sends a string to the modem and doesn't check whether the line is busy.

You can create a button that hangs up the modem. The basic format of the dial command is:

```
dial phonenumber with modem modemCommands
```

If you specify 'with modem,' HyperCard sends the information out the modem port. The modemCommands are commands you can send to the modem, such as the Hayes command set with which Apple modems are compatible.

To tell HyperCard to dial the number

```
9,555-1212
```

you'd use the dial command

```
dial "9,555-1212" with modem "ATS0=ODT"
```

which would send the string ATS0=ODT9,555-1212 out the modem port. If your modem understands the Hayes command set, it dials the phone. Because Hypercard is not looking at the modem port, it ignores any "busy" signal sent by the modem.

To make the modem hang up, you need a button that sends a character to the modem. This button script hangs up the phone if it gets a busy signal:

```
on MouseUp
```

```
    dial "n" with modem " "  
    -- n can be any number. The space in quotes is there because the  
    -- default for the 'with modem' command is ATS0=0DT.  
end MouseUp
```

Macintosh: Double lines in MacWrite

Revised: 2/11/88
Security: Everyone

Macintosh: Double lines in MacWrite

=====

This article last reviewed: 17 December 1984

Double lines, which are often used to set off a heading or divide segments in a bulletin, can easily be created in MacWrite. To do so: hold down the command key while pressing the letter U to toggle on the underline operation, or choose Underline from the Style menu. Next, hold down the Shift key while pressing the hyphen/line key (to the left of the = key); you should see a double line move across the screen.

Creating the same effect under a word or a group of figures in a column can only be approximated. First, enter the double line for two or three spaces. Then enter your figures with the Underline option toggle on to get a single underline, and then follow with a double line for two or three more spaces.

This suggestion was reprinted from the Open Window column in the December 1984 issue of MacWorld.

LisaDraw, MacDraw, MacPaint: White letters on a black background

Revised: 12/17/84
Security: Everyone

LisaDraw, MacDraw, MacPaint: White letters on a black background

=====

Need to put white letters on a black background? Well, just do the following.

MacPaint:

1. Select the text option from the pallet; select the font of your choice, then Outline or Shadow from the Style menu and type in your text.
2. Select the Paint Can from the pallet, then a shade of black. Move the pointer (now a small paint can) off to the side of your text and double click.

The Paint Can fills in the region around your text in black, leaving your typed characters white.

MacDraw or LisaDraw:

1. Type in your line, then change your letters to Outline or Shadow, with a fill of none.
2. Draw a box, circle, etc., over the top of your text.
3. While your box is still selected, select Send to Back from the Arrangement menu, then choose a fill of black.

The end result gives you white letters on a black background.

Apple Writer IIe: Converting DOS files to ProDOS

Revised: 12/17/84
Security: Everyone

Apple Writer IIe: Converting DOS files to ProDOS

=====

To convert Apple Writer IIe DOS files to ProDOS, first print your files to disk:

1. Insert your destination diskette into the drive.
2. Press "p" while holding down the Control key.
3. Type in PD8 Return.
4. Press control P again, then press NP to begin printing to your disk.
Enter your file name when prompted. Don't forget to type the disk drive and slot number if necessary.

By the way: you type PD8 because there is no slot 8 in an Apple IIe. This alerts Apple Writer to print to a disk and ask you for a file name.

Now convert your file from DOS to ProDOS using the Apple IIc Utilities disk (part number 680-3234) or the CONVERT program on the the ProDOS User's disk (pn 680-0224).

Security: Everyone

HyperCard: Importing and Exporting Text, and Where To Get Info

=====

Article Created: 12 October 1987
Article Reviewed/Updated: 2 October 1995

TOPIC -----

Here is a button script that imports text data into HyperCard. The data source is a text file with the following format:

```
data<tab>data<tab>.....data<tab>data<carriage return>
data<tab>data<tab>.....data<tab>data<carriage return>
data<tab>data<tab>.....data<tab>data<carriage return>
...
```

DISCUSSION -----

This script reads data and puts it into a field in the card where the button is. It moves to the next field when it encounters a tab, and makes a new card after a carriage return. This script requires that the number of fields in your card equals the number of data items you want to import.

Begin_Table

```
on mouseUp
  ask "Import text from what file?" -- Ask user for name of source file.
  if it is empty then exit mouseUp
  put it into fileName -- "put" and "open" open the text file for reading.
  open file fileName
  repeat -- Data is imported in the "repeat" loops.
    doMenu "New Card" -- Make a new card.
    repeat with i = 1 to the number of fields - 1
      read from file fileName until tab -- Read text from the file until Tab
      -- character is encountered.
      put empty into last char of it -- Remove Tab.
      put it into field i
    end repeat
  read from file fileName until return
```

```
    if it is empty then -- end of file
      if i = 1 then doMenu "Delete Card"
      close file fileName
      exit mouseUp
    end if
    put empty into last char of it -- remove Return.
    put it into field (i + 1)
  end repeat
end mouseUp
```

End_Table

When the first tab is encountered, the tab is removed from the string and the data is placed in field one. This is done until the next to last field, because we have to look for a carriage return at the end of the last field. We then read in data until a carriage return occurs, and the data is placed into the last field of the card.

This script has been used to import data files 500K and larger into HyperCard. It may have to be changed to work with a specific data file or format.

You can also EXPORT text from HyperCard fields into a text file. You can tab delimit the fields, or use any character you want:

Begin_Table

```
on mouseUp
  ask "Export text to what file?" -- Ask user for name of source file.
  if it is empty then exit mouseUp
  put it into fileName -- "put" and "open" open the text file for reading.
  open file fileName
  repeat with i = 1 to the number of cards -- go through all the cards
    go to card i
    repeat with j = 1 to the number of fields - 1
      write field j to file fileName -- get the field and write it out
      write tab to file fileName -- put a tab after it,
      -- or any character you want
    end repeat
    write field (j + 1) to file fileName -- write the last field
    write return to file fileName -- and a carriage return
  end repeat
  close file fileName
end mouseUp
```

End_Table

This would export the data you had just imported with the first script.

NOTE: This second script has NOT been extensively tested.

ANOTHER NOTE: This is NOT the only way to import & export data: use it as a guide for your own scripts. These examples were chosen because

tab-delimited data is a common format. HyperCard offers a large amount of flexibility in reading data in and out, and it would be impossible to describe all the different methods in this article. There are various sources of information regarding the HyperTalk scripting language.

For more information:

- HyperCard's Help stack (look for "ask", "put", "open", "write", "repeat", and "doMenu")
This part of HyperCard is often overlooked. The built-in help has descriptions of the HyperTalk commands available to you, and is on-line.
- "HyperCard Script Language Guide" (APDA)
This is the definitive guide to the HyperTalk scripting language. It contains descriptions to all the HyperTalk commands available, and also discusses the HyperCard environment.
- Danny Goodman's "The Complete HyperCard Handbook" (Bantam)
This was the first book available as a reference for HyperCard, and covers the tools available in HyperCard, as well as how to use the scripting abilities. It also has example scripts.
- Additional third-party books.
You should be able to find various other books on HyperCard at a local computer bookstore.
- The User Groups Icon on AppleLink.
This icon is a meeting place for Apple dealers and user groups to exchange information relating to Apple products. There is also a HyperCard folder, devoted to questions and answers and public domain and shareware utilities and stacks for HyperCard.

ImageWriter II: Carriage Motor Makes a Loud Humming Noise

Revised: 1/30/92
Security: Everyone

ImageWriter II: Carriage Motor Makes a Loud Humming Noise

=====

This article last reviewed: 9 September 1987

BEFORE YOU START: Familiarize yourself with the ImageWriter II Technical Procedures. Be sure to follow proper ESD procedures.

PROBLEM: The carriage motor makes a loud "humming" noise when the carriage moves to the left side of the printer upon power up. This sometimes occurs after the printer has been taken apart and reassembled.

CURE: Check to make sure the ground strap from the CPU board to the Driver PCB is NOT routed around the right side of the motor mount. If the ground strap gets between the motor mount and the carriage assembly, the left carriage position sensor never detects the carriage, consequently the motor stays on as the printer tries to complete the power up sequence. The ground strap should be positioned between the motor mount and the left side of the case. If the ground strap is routed correctly see the General Troubleshooting Procedures for the ImageWriter II.

=====

This article last reviewed: 28 September 1987

When the latest ("platinum") version of the Apple IIc was released, the main circuit board was changed to accommodate the new Memory Expansion Card. The firmware was also changed: the logical location for the mouse was moved from slot 4 (where the memory card image now resides) to slot 7.

This causes problems when customers run the sample BASIC program in Appendix A of the AppleMouse II User's Manual. To make the program work correctly with the newest Apple IIc, change all occurrences of [slot] 4 to [slot] 7.

LisaCalc: Problems with rounding

=====

In cell A2, enter the formula `INT(A1*100)/100`; in cell A1, enter the value 1.17. You would expect the result in A2 to be 1.17; however, due to difficulties in converting decimal to binary and back, the result returned is 1.16. If the intent of the above expression is to round to two decimal places, then use `ROUND(A1,2)` or `ROUND(INT(A1*100)/100,2)`. To compare the two cells to see if they are equal, use `IF(A2-A1<.0001,EQUAL,NOTEQUAL)`.

AppleShare PC: A Description (Discontinued)

Revised: 6/6/94
Security: Everyone

AppleShare PC: A Description (Discontinued)

=====

This article last reviewed: 16 October 1987

Overview

With AppleShare PC, users of IBM PCs (and PC-compatibles) can share, with Macintosh users on an AppleTalk Personal Network, the information stored on an AppleShare file server. AppleShare PC software gives an MS-DOS user the same ability to access folders, documents, applications, and storage space that Macintosh users have. Yet using the AppleShare server from an MS-DOS PC is as easy as using a local disk drive -- AppleShare volumes appear to IBM PC users as logical DOS drives, and are accessed using most standard DOS commands. Most applications and documents can be stored and used on the server with no modification.

The AppleTalk PC Card used with AppleShare PC also lets users print, on the LaserWriter, documents they have created using MS-DOS applications. With Apple File Exchange and other optional file conversion products, Macintosh and PC users can share documents created under different operating systems. And optional bridges give PC users access to AppleShare servers on other interconnected AppleTalk networks.

Users need to remember only one password. Once a user has logged on to a server, the server automatically manages access to all directories.

System Requirements

- A PC-compatible computer with at least 384K of RAM
- two floppy disk drives (a hard disk is recommended)
- MS-DOS version 3.1 or later
- AppleTalk PC Card
- An AppleTalk Connector Kit

Installation

1. Install AppleShare PC software on a startup disk.

2. Add an AppleTalk PC card to an IBM PC or PC-compatible computer.
3. Attach the computer to an existing AppleTalk network equipped with an AppleShare server.

Features and Benefits

MS-DOS access to AppleShare allows:

- MS-DOS and Macintosh file server users to access information stored on an AppleShare file server.
- Provides a foundation for multi-user programs that allow Macintosh and MS-DOS users to work with the same information at the same time.
- Lets Macintosh and MS-DOS users work with data files created by applications that use a common file format (for example, Excel for the Macintosh and Lotus1-2-3 for the IBM PC).
- Lets AppleShare PC users share MS-DOS applications stored on AppleShare file server volumes. (The software license must allow for application sharing.)

Support for file translation:

- Allows Macintosh and MS-DOS users utilities to share documents created under different operating systems when used with optional file translation products such as Apple File Exchange.
- Makes it easier to share data between different operating environments.

Privacy (Access Privileges)

AppleShare PC fully supports the AppleShare server's powerful privacy system. File server users control information by selectively granting access to the directories they own on the file server volumes. Access privileges allow the owner of a directory to keep information private, share it with a work group, or make it available to everyone on the network.

Users can control the type of access others have to the contents of a directory. There are three levels of access:

- see documents and applications stored in the directory
- see subdirectories beneath that directory
- see, read, and make changes to documents, subdirectories, and applications located in the directory.

Flexible access privileges make many kinds of directories possible.

- Private directories. Documents stored there remain private to the owners. Only the directory's owner can see or change documents stored there.

- Shared directories. Documents stored there can be seen and read by everyone on the network; however, only the directory's owner can change the documents stored there. This is useful for storing forms which you wish everyone on the network to copy and use but not be able to change. Documents stored there can be seen, read, and changed by others on the network.
- One-way drop boxes. Anyone on the network can copy documents into the drop box, much like a one-way mail slot; however, only the directory's owner can see documents stored there or make changes to them. This is useful for collecting and storing sensitive documents such as expense reports and personnel evaluations.

LocalTalk: Description of Cable System Hardware

Revised: 9/18/89
Security: Everyone

LocalTalk: Description of Cable System Hardware

=====

This article last reviewed: 02 May 1989

Overview

The cables and connectors in the LocalTalk Cable System incorporate a locking mini-3 (AppleTalk) connector. The connector assembly has a small latching pin as part of the male connector shield sleeve that mates to a receptacle in the female connector housing. Insertion of the connector latches the pin; the male connector sleeve must be pulled back to extract the pin, freeing the connector. The latching connector is engineered to have a shear pull force of no less than 6 pounds, preventing the accidental loosening of the connectors.

Compatibility

The cables are compatible with earlier connectors, except that there is no latching action if any old-to-new connection is made (either new male to old female, or new female to old male).

Custom Cable Assembly

Because of the added complexity of the new connector assembly, customers are not required to construct the actual connector as before. Instead, the new cable assembly will consist of simply splicing cables together with a new "splice box".

1. The user will take a short 6- to 8-inch cable section (which has a latching connector on one end and the wires stripped in "pig-tail" fashion in the other) and place the stripped end into the splice box housing.
2. The next step is to strip the end of the plenum cable and place it in the other side of the splice box.
3. Closing the box forces the wires between two insulation displacement fasteners, making a wire-to-wire connection and at the same time ensuring

a positive cable shield attachment, acting as a secure strain relief.

Cable/Connector Kits

LocalTalk Locking Cable Kit-10 meter

LocalTalk Locking Connector Kit-din8

LocalTalk Locking Connector Kit-DB9

LocalTalk Locking Cable Kit-25 meter

AppleTalk Custom Wiring Kit: Includes 100 meters (300 feet) of plenum cable, 26 cable and connector assemblies, and 4 cable extenders.

GS BASIC: Features and Editing Commands

Revised: 10/19/87
Security: Everyone

GS BASIC: Features and Editing Commands

=====

This article last reviewed: 15 October 1987

ToolBox Primitives

GS BASIC includes primitives (built-in, low-level commands) that let the user interact with the ToolBox routines. Whereas most other ToolBox routines are implemented in external libraries that need to be explicitly called up, these commands -- Eventdef, Menudef, and Taskpoll -- are included in GS BASIC itself because they bind the ToolBox and BASIC line numbers.

Eventdef. The structure of Macintosh-like programs, as implemented by the Apple II GS and its ToolBox routines, requires that programs be event-driven. This means that the heart of a program is a main loop that constantly monitors what events -- mouse clicks, keyboard presses, window update events, network activity, and so on -- have taken place. Eventdef associates BASIC line numbers with these events: whenever one of these events occurs, GS BASIC starts running the instructions specified in a table set up by the programmer and maintained by Eventdef.

Menudef. One of the places a mouse click can occur is in the menu bar. When this happens, a menu is displayed, letting the user select a menu item. The user specifies that a certain function is to be performed. Like Eventdef, Menudef associates BASIC line numbers with menu items, so that when a menu item is selected, GS BASIC can easily determine what statements to run, and run them.

Taskpoll. Programs shouldn't start fielding events and responding to them until all the ToolBox libraries are loaded and the tables that Menudef and Eventdef maintain are initialized. The Taskpoll command lets the programmer turn off the interrupting feature of GS BASIC and turn them on when ready for them.

Procedures and Functions

The most convenient structure of of any program is a procedure, function, or

subroutine. In most BASICs, including Applesoft, subroutines are implemented in a very straightforward fashion. GS BASIC provides a more powerful way to specify and call procedures.

Applesoft lets programmers call subroutines with the GOSUB xxx command, where xxx is the line number to which control branches. Statements are then executed until a RETURN command is executed, at which time the program returns to the line that called the subroutines, and continues from there.

GS BASIC allows programmers to define specific procedures that are called with the PROC command. The PROC command performs the same functions as Applesoft's GOSUB, and lets the programmer pass local parameters as well.

Editing Commands

GS BASIC has a more powerful line editor than Applesoft's. Access it by typing EDIT linnum[-linnum]

CONTROL-D	delete character to the left of cursor; moves line to left
CONTROL-F	delete character under the cursor; moves line left
CONTROL-X	delete entire line
CONTROL-Y	delete line to left and under cursor
CONTROL-E	toggle insert mode
RETURN	accept entire line (even characters to right of cursor)
DELETE	same as CONTROL-D

GS BASIC: Overview of Features

Revised: 10/19/87
Security: Everyone

GS BASIC: Overview of Features

=====

This article last reviewed: 15 October 1987

GS BASIC vs Applesoft BASIC

Unlike Applesoft BASIC, GS BASIC gives programmers access to all of the new features of the Apple IIGS: Super hi-res graphics, the Ensoniq sound chip, expanded memory, the new Tools, and other enhanced ROM facilities.

GS BASIC is an entirely RAM-based language. It does not rely on Applesoft, nor is it related to it in any way except that they are both BASIC languages. In fact, because of advanced features like access to all of GS RAM, more powerful I/O instructions, and access of external routines, GS BASIC is not 100% compatible with Applesoft. The number of commands is increased from 120 to over 200 (see List of GS BASIC Commands), many Applesoft BASIC commands do different things in GS BASIC, and some Applesoft commands do not appear in GS BASIC at all (PR#, IN#, and HGR for example). Applesoft and GS BASIC files are stored differently on disk, and are not interchangeable. Finally, GS BASIC is designed to run under ProDOS 16, whereas Applesoft can run only under ProDOS 8. Otherwise, GS BASIC would not be able to take advantage of the GS's powerful new features.

GS BASIC gives the programmer twice the number of variable types that Applesoft has. In addition to Integer, Real, and String types, GS BASIC provides Double Real, Double Integer, and Long Integer.

GS BASIC is not as fast as Applesoft. Applesoft runs the following program in 4 seconds, while GS BASIC takes 43 seconds:

```
10 FOR i = 1 TO 10000
60 NEXT i
```

With longer programs, the difference is less. This program takes Applesoft 48 seconds and GS BASIC 217 seconds:

```
10 FOR i = 1 TO 10000
```

```
20 a=i-i
30 a=i+i
40 a=i/i
50 a=i*i
60 NEXT i
```

Access to External Routines

One of GS BASIC's main advantages is its powerful library and external routine facilities. Provided with GA BASIC are many ToolBox Definition Routines (TDFs) that let programmers call the GS's ToolBox routines (QuickDraw II, Menu Manager, Window Manager, Sound Manager, and so on). These routines are setup with the LIBRARY command, and called with the CALL and EXFN commands.

Programmers can also define and call their own library routines. These are loaded with the INVOKE command, and called with the PERFORM and EXFN commands.

Display Format

GS BASIC offers improved formatting of listings. Users can specify how much space appears between a line number and the first statement, and how far to indent when listing program statements within a FOR...NEXT or DO...WHILE...UNTIL loop. See the List of Built-in Constants and Reserved Variables.

Sound

Sound is created through Sound Manager routines.

Built-in Constants and Variables

GS BASIC includes pi calculated to 20 digits. Also, GS BASIC stores many system parameters in reserved variables. Much of the system's status can be determined and changed by examining and setting these variables. For example, the cursor's screen position is stored in the variables VPOS and HPOS. You can move the cursor simply by assigning new values to these variables.

Labels

GOTO, GOSUB, and ON xxx commands can point to labels instead of line numbers, making programs much easier to follow. Instead of:

```
1234 GOSUB 50: REM Read a character from the modem
```

the programmer can type:

```
1234 GOSUB READ_MODEM
```

Looping

GS BASIC includes three looping structures not in Applesoft:

```
IF...THEN...ELSE
FOR...NEXT...STEP
DO...WHILE...UNTIL
```

These structures, common in other languages such as Pascal and Fortran, give the programmer greater flexibility in program control. In addition, the IF...THEN structure has multi-line capabilities. This means that all statements that appear between the IF and the THEN do not have to appear on the same line.

PRINT USING and INPUT USING

PRINT USING and INPUT USING have long been a features of BASICs other than Applesoft. GS BASIC implements them with a vengeance, making them nearly as powerful as FORTRAN format statements. A programmer has many ways to specify how to print data to a screen and read it from a keyboard or other device.

When defining a USING statement, a programmer can specify it in many ways. The first way is to specify the format on the same line, right after the USING statement. The second way is to assign the formatting string to a variable (such as FMT\$), and then enter that variable after the USING statement. This allows the programmer to use the same formatting in many PRINT statements. Or, if the programmer doesn't want to use variable space to store a formatting string, he can use the IMAGE command to define it. The programmer can then simply refer to the line on which it appears in the PRINT USING statement. All of these options apply to INPUT USING as well.

PRINT and INPUT USING don't merely have to work with the text screen. With optional device extensions, a programmer can PRINT or INPUT to or from a file, or PRINT to a printer or even the Super-Hi-res graphics screen.

Finally, GS BASIC offers many formatting commands that are to be placed in the formatting strings. These are divided into three groups: String Spec, Literal Spec, and Numeric Spec. Numeric Spec is further divided into three sub-sections: FIXSPEC, SCISPEC, and ENGRSPEC. The SCALE command can be used to accurately reposition a decimal point in a floating point number.

Macintosh Mouse: Mouse/Cursor Tracking

Revised: 5/10/89
Security: Everyone

Macintosh Mouse: Mouse/Cursor Tracking

=====

There is a way to detect if the mouse was moved and how far it was moved. The mouse location call provides the current coordinates of the mouse position. If two successive calls to mouse location yield different results, then the mouse has moved, and (given the previous and present coordinates) the distance traveled can be calculated. If you wish to know the total distance the mouse traveled between calls to mouse location, then you should use the mouse odometer. The fact that the mouse moves is not considered an event, so it is up to the programmer to determine the mouse's location and distance traveled. Also note that the only thing that happens to a cursor as it travels around the screen (without any mouse clicks) is that the cursor changes according the area it is in--e.g., it becomes an I-beam over text, a cross in a spreadsheet, and an arrow most other times. It should also be noted that these cursor changes are under program control and are not automatic.

Here is a small program that uses some of the cursor/mouse tracking routines. These routines automatically keep the cursor on the screen--i.e., if the cursor is already at the left edge of the screen and you move the mouse further left, the cursor stays on the screen. This program is similar to the Hendrix program on the MacMaster 2 disk in that it makes noise.

```
PROGRAM VOL;
USES
{$U-}
    {$U QD/QuickDraw } QuickDraw,
    {$U QD/QDSupport } QDSupport,
    {$U QD/Hardware } Hardware;
{$U+}

VAR heapBuf:    ARRAY[0..10000] OF INTEGER;{must keep array under 32K
byte limit}
    ABS,ORD:PIXELS;
    event:      KeyEvent;

FUNCTION HeapFull(hz: QDPtr; bytesNeeded: INTEGER): INTEGER;
{ This function will be called if the heapZone runs out of space }
```

```
BEGIN
  WRITELN('The heap is full.  The program must now terminate! ');
  Halt;
END;

BEGIN {MAIN PROGRAM}
  {----- Initialization - Generic to all applications using QuickDraw
  -----}
  QDInit(@heapBuf, @heapBuf[10000], @HeapFull); { Must do this once at
beginning }

  INITCURSOR;
  SHOWCURSOR;
  REPEAT
    MOUSELOCATION(ABS,ORD);
    SETVOLUME((ABS DIV 120)+1);
    NOISE(ORD *(8000 DIV 360)+80 );
  UNTIL KEYBDEVENT(FALSE,FALSE,EVENT);
  HIDECURSOR;
  SILENCE
END.
```

Daisy Wheel Printer: Problem with random marks in printed output

Revised: 1/26/87
Security: Everyone

Daisy Wheel Printer: Problem with random marks in printed output

=====

When random ticks, accents and so on show up in the printed output of a daisy wheel printer, there are two probable causes:

1. The printwheel is bad. If the spokes of a printwheel were either poorly manufactured or subsequently bent, then the hammer may strike two spokes at a time. If the same letters are always printing poorly, then it is likely that the printwheel is at fault.
2. The stepper motor and the hub where the printwheel mounts are out of sync. To check this, print vertical lines using the vertical bar character and horizontal lines using the underscore character. If the characters are not vertical or horizontal and the lines are broken, then the alignment is off.

AppleWorks 1.1: Indentation Problems On A Scribe Printer (9/95)

=====

Article Created: 4 May 1985
Article Reviewed/Updated: 19 September 1995

TOPIC -----

When I print from AppleWorks 1.1 to my Scribe printer the second paragraph always prints with the wrong indentation. Why does this happen?

DISCUSSION -----

When you print an AppleWorks 1.1 file using the Scribe printer, the first paragraph always prints with an indentation of 5 spaces, as it should. If, however, the second paragraph prints without the proper indentation, check to see whether justification is set to FULL JUSTIFY. If not, set the justification to FULL JUSTIFY and then try again. This problem has been corrected in later versions of AppleWorks.

AppleWorks 2.0: New way to create Mail Merge documents

Revised: 1/26/87
Security: Everyone

AppleWorks 2.0: New way to create Mail Merge documents

=====

AppleWorks 2.0 lets you merge database records with word processor documents to create mail merge documents using a new print option which can be imbedded in a word processor file.

1. From the database, create a table style report.
2. The records appear on the clipboard in the order of the last sort in the table style report. Open your word processor document.
3. In your word processor document, place the cursor where the mail merge category should go. Select "MM" from the Open-Apple-O printer options. A list of Mail Merge catagories appears.
4. Select a database category. Answer the question regarding whether a line should be deleted if the category is blank.
5. Repeat steps 3 and 4 until all the categories you want are placed in the document.

Mail Merge places the database category in the document with a provision for appending one space at the end of the merged entry. A caret also appears in front of the category name. AppleWorks marks this caret as a mail merge printing option; place the cursor on this caret and the prompt line reads "Mail Merge".

6. Press Open-Apple-P to print the word processor document.
7. If there is mail merge data in the document, AppleWorks will ask you if you want to print the document with the categories merged, or un-merged (as you see it on the screen.)
8. If there isn't mail merge data on the clipboard, AppleWorks tells you. Be further aware that only during printing does AppleWorks report an error if the word processor document has a category name that AppleWorks cannot find on the clipboard.

LisaCalc 7/7: The NPV function is different

Revised: 1/26/87
Security: Everyone

LisaCalc 7/7: The NPV function is different

=====

The NPV function has changed in the 7/7 version of LisaCalc. In the old version (2.0), the first value of the cashflow was counted as the payment for the first period and was thus discounted (annuity due). The formula looked like this:

$$v1/(1+discount)^1 + v2/(1+discount)^2 + \dots vn/(1+discount)^p$$

where v is the value of your cash flow, discount is the discount percentage, n is the number of the payment, and p is the number of the period.

In the new LisaCalc 7/7, the first value of the cashflow is not counted as the first period and not discounted (annuity arrears). The formula looks like this:

$$v1/(1+discount)^0 + v2/(1+discount)^1 + \dots vn/(1+discount)^p$$

It's just another way of looking at the same function. Both are equally correct.

LisaWrite 2.0: Landscape Printing

=====

There is a problem printing in Landscape mode in LisaWrite 2.0. Missing and partly formed characters are printed in the upper right portion of a write document printed 'while you wait'. (Versions 3.0 and 3.1 of Lisa 7/7 don't give you the option of printing 'while you wait', so the problem doesn't occur with these versions.)

The workaround is to print 'while you work'.

Apple File Exchange: A Description (Discontinued)

Revised: 7/24/95
Security: Everyone

Apple File Exchange: A Description (Discontinued)

=====

Article Created: 15 October 1987
Article Reviewed/Updated: 24 July 1995

Overview

Apple File Exchange (AFE) is an application that lets users:

- copy files and directories from one file system to another
- convert files from one file format to another
- transliterate the characters in a file from one character set to another

AFE copies files among three file systems: Macintosh, ProDOS, and MS-DOS.

System Requirements

Apple File Exchange runs on any Macintosh that supports double-sided disks. If you want to use Apple File Exchange to read and write MS-DOS disks, your Macintosh must have a SuperDrive installed.

Apple File Exchange is not compatible with any operating system beyond System 7.1. You should use PC Exchange to get the same file translation capabilities in operating systems after System 7.1.

Advantages of Apple File Exchange

For developers writing translation routines, AFE has important advantages over other file conversion utilities:

- It performs batch translation of dissimilar files. Files of different types can be translated in a single operation
- It can move files between Macintosh disks, 800K ProDOS disks, and 5.25-inch MS-DOS disks.
- It is generally available.

- It provides a consistent, easy-to-use human interface for all translations.
- It provides a framework that allows quick development of new translation routines. Apple File Exchange handles the user interface and provides file system calls that are the same for all file systems. This frees developers to concentrate on actual file conversion.

Translators

A translator is a routine invoked by AFE when it copies a file. These routines are used to convert a file from one format to another. As part of translation, translators may also transliterate a file -- that is, convert the printable characters in the file to the equivalent characters in another character set.

Although AFE includes several built-in translators, most translators are produced by independent software publishers. The built-in translators perform a number of fundamental translations, such as converting text files from one file system to equivalent text files on another. All other translations are performed by translators that are separate from AFE.

All translators, with the exception of the fundamental translators built into AFE, are kept in translator files in the Apple File Exchange folder.

Translator Menus

Translations are performed using selection menus, or translator menus.

Translator menus are the AFE menus that display currently available translators. Depending on the disks currently selected, AFE displays either one or two translator menus:

- If the file systems of both the source and destination disks are the same, there is only one translator menu. The Mac-to-Mac menu is an example.
- If the file systems of the source and destination disks are different, there are two translator menus. One menu contains translators that handle translations from the first file system to the second (for example, Mac to ProDOS), while the other menu contains translators that handle translations in the opposite direction (for example, ProDOS to Mac).

Active and Inactive Translators

The translators shown in translator menus are either active or inactive.

- Active translators are those that Apple File Exchange will attempt to use when translating a file.
- Inactive translators are those that Apple File Exchange will not attempt to use when translating a file.

Users activate and deactivate translators by selecting their names in the

menu. Selecting an active translator makes it inactive, while selecting an inactive translator makes it active. An active translator is shown with a check mark to the left of its name in the menu.

General-purpose and Special-purpose Translators

Each translator menu is divided into parts:

- At the top of the menu are special-purpose translators. These translators are used in cases where either the source file format or the destination file format is used by a limited range of applications. Except in very rare cases, translators written by suppliers other than Apple will be special purpose translators (for example, MultiMate to MacWrite).
- If translators have been imported to this menu from another menu, they appear in the middle of the menu.
- At the bottom of the menu are general-purpose translators. These convert file formats used by a wide variety of applications to other widely-used formats. One example is a translator that converts text files from one file system to equivalent text files on another file system. Another possible example would be a translator for encrypting files. Except in very rare cases, the only general-purpose translators will be those that are built into Apple File Exchange.

The parts of the translator menu are separated by dotted lines. Special-purpose translators are shown in alphabetical order, while general-purpose translators are arranged by their resource ID numbers.

General-purpose translators have two important limitations that distinguish them from special-purpose translators:

- They can't be imported into other menus.
- In the dialog box that allows the user to select a translator when more than one translator can translate a file, general-purpose translators are not shown. It is assumed that one or more of the general-purpose translators can translate any file.

MacWorks: Starting Up From a Hard Disk

Revised: 7/30/87
Security: Everyone

MacWorks: Starting Up From a Hard Disk

=====

There are several versions of MacWorks, each with a different start-up procedure. The two later versions let you access the built-in 10-megabyte hard disk (in a Macintosh XL) or a 5- or 10-megabyte ProFile connected to the built-in parallel port of a Lisa 2.

MacWorks: 682-0103-A

After the Macintosh XL starts up from this original version of MacWorks, the system can run almost any Macintosh application residing on diskette. But this version cannot access a hard disk.

MacWorks: 682-0103-B

MacWorks Revision B can access Macintosh software and files on diskette, as well as on a hard disk installed with the MacWorks Hard Disk Install program. Once you install MacWorks, you can access the hard disk by starting up from MacWorks XL and then inserting the System Diskette.

MacWorks XL: 682-0103-C and MacWorks: 682-0103-C

MacWorks Revision C is not an official release and could damage documents and data stored on the hard disk. If you use this or earlier versions of MacWorks, be sure to upgrade to MacWorks XL Revision D, available from Sun Remarketing, P. O. Box 4059, Logan, Utah 84321.

MacWorks XL: 682-0103-D

MacWorks XL lets you to start up from the hard disk. It also lets you use additional Macintosh software, such as Jazz and XL/Serve by Infosphere. This version supports AppleTalk and the LaserWriter. This version is identified by the product number on the diskettes and by the display "MACWORKS XL 3.0 COPYRIGHT 1985 - APPLE COMPUTER" that appears on the screen during startup.

MacWorks XL enables you to start up off the hard disk directly if:

1. You've previously used the accompanying hard disk install program to install MacWorks on the hard disk, and
2. The hard disk is being used exclusively for Macintosh software.

If the hard disk contains both Lisa and Macintosh software, you must first start up from MacWorks XL, but even this procedure is faster than with previous versions. Hold down the option key and start up the Macintosh XL if you want to start up with software from the microdisk drive.

The Hard Disk Install program that comes with MacWorks Versions B and D lets you initialize the hard disk to either 1) run exclusively Macintosh software, or 2) to run both Macintosh and Lisa software. To share the hard disk with Lisa software, you must first partition the hard disk with Lisa Office System software (selecting Share during the Lisa software install procedure); you must then use the Hard Disk Install program to initialize the Macintosh portion of the hard disk.

If you use BOTH 1) the built-in parallel port connected to a hard disk, or the built-in hard disk after it's been formatted exclusively for Macintosh software, AND 2) a Parallel Interface Card connected to a hard disk formatted for Lisa software, then you'll have to select the hard disk you want the system to start up from. The system will automatically start up from the hard disk last used, provided you haven't unplugged the system or changed the Preference settings. To start up from the other hard disk:

1. Press the On-Off button.
2. Wait for the memory board test.
3. Hold down the Apple key while pressing a number key as listed below:

To start up from:	press these keys:
Internal hard disk:	Apple 1
Built-in parallel port:	Apple 3
Interface card:	
slot one, lower port	Apple 4
slot one, upper port	Apple 5
slot two, lower port	Apple 6
slot two, upper port	Apple 7
slot three, lower port	Apple 8
slot three, upper port	Apple 9

Lisa 7/7: SHIFT-OPTION-7

Revised: 11/15/84
Security: Everyone

Lisa 7/7: SHIFT-OPTION-7

=====

The Lisa Office System Manual for 7/7 documents a procedure to get screen dumps to disk. When this SHIFT-OPTION-7 keystroke procedure is performed, the diskette drive makes the noise of a diskette access. Yet, after this access, there doesn't seem to be anything other than missing blocks on the diskette. And even though the workshop can recognize the file that the disk access created, this file is of little use without some software that is unavailable to the casual user. The tried and true SHIFT-OPTION-4 screen dump is still the best procedure for most users.

Apple II and II+: Problems with keypresses on the keypad

Revised: 11/15/84
Security: Everyone

Apple II and II+: Problems with keypresses on the keypad

=====

A keypress on the numeric keypad is only retained as long as the key is held down. When the key is let up, the keyboard returns to its previous state (with the key that was last pressed on the keyboard at location \$C000). This causes many strange problems, like having to hit the key longer to have it recognized. There is no way to correct this on the current keypad because of the limitations of the keyboard encoder chip.

Apple FORTRAN: Scientific Notation

Revised: 11/15/84
Security: Everyone

Apple FORTRAN: Scientific Notation

=====

To input numbers in scientific notation on the Apple FORTRAN system with both the E and F format specifications, follow this example:

```
10      FORMAT ( E10.2 )  
      READ (A, 10)
```

When you specify an input field as E10.2, FORTRAN sets aside a field of 10 places, and will put the decimal two places in from the right unless the input string has an explicit decimal point in it.

Another interesting result occurs if you enter the number in scientific notation. FORTRAN reads in the number up to the E and then starts reading the exponent using the next format specification in the FORMAT statement. The example above would use the E10.2 spec for both the mantissa and the exponent. The string 1.0E1 would be read as 1 times ten raised to ten to the tenth power.

```
10  
10  
1 * 10 = 1 followed by 10000000000 zeros.
```

This, of course, causes an overflow error.

You can get around this problem either by specifying a decimal in the exponent or by padding the input field with spaces. The following example has the entered string in brackets to indicate the extra spaces.

You enter	Fortran interprets
>1.0E1<	10000000.00
>1 E1 <	1.00
>1.0E1.0<	1.00
>1.0E1 <	1.00

Softcard III: BDOS Errors

Revised: 11/15/84
Security: Everyone

Softcard III: BDOS Errors

=====

Sometimes, as a program runs, it drops out with a message BDOS ERROR BREAK IN (various numbers). After this, either the program proceeds after a return or the entire machine is locked up. This happens at infrequent intervals on many other Apple IIIs and other Softcards.

It may seem that the problem is hardware-related, but in fact BDOS ERRORS are usually caused by the CP/M software when it attempts to access a device that is not ready or not on line. In the most common situation, the program tries to read a non-existent disk drive; this reports a BDOS ERROR ON xx: SELECT. Typing a RETURN should return you to the system prompt, and typing an 'R' will retry the last command. The BDOS ERROR BREAK message example above is from MBASIC and refers to the fact that the program attempted to access a device that is not ready or on line; the number in the message is the line number of the MBASIC statement which tried the read. To avoid this message, use the ON ERROR GOTO statement to branch to statements that display instructions to ready the device or put it on line.

Softcard III: Using CP/M with a Profile

Revised: 11/15/84
Security: Everyone

Softcard III: Using CP/M with a Profile

=====

The Softcard III Installation manual recommends on page 83 that a user allocate 3200 SOS BLOCKS into two CP/M volumes (each 1600 blocks) when setting up ProFile. This will give the user approximately 792K in each CP/M volume. These blocks are on the ProFile and in no way effect the size of the transient program area (TPA). The TPA is fixed by the implementor (Apple) and cannot be changed. The size of the TPA is defined as the memory range from 0100H to the bottom of the BDOS (0CC00H), which works out to 50.75K (51,960 Bytes). Note that the TPA includes the area of memory used by the CCP (2K). Application programs may overwrite the CCP and use the 2K of memory, but must exit back to the CP/M system via a Warm Boot (which reloads the CCP).

Remember that SOS device drivers reside outside of the CP/M environment and therefore have no effect on the size of CP/M. CP/M takes up 56K in the Apple III because of the amount of BIOS code required to interface to device drivers.

Use 2060 blocks for each CP/M volume on the ProFile. This works out to 1 Meg of user space (exlcuding directory) for each volume. We highly recommend that you use the updated version of the CP/M Boot & BIOS code, version 2.21.

HyperCard: How To Hide Its Title Bar on External Monitor

Revised: 6/2/88
Security: Everyone

HyperCard: How To Hide Its Title Bar on External Monitor

=====

Article Created: 2 June 1988
Article Last Reviewed: 5 June 1992
Article Last Updated:

TOPIC -----

I am doing a presentation and want to hide HyperCard's title bar so it doesn't appear that I am in HyperCard.

DISCUSSION -----

When HyperCard is run on a Macintosh with a display larger than nine inches (basically, any Macintosh with an external monitor), a title bar normally appears at the top of the HyperCard window. It's possible to make this title bar invisible (on a color system), and it's also possible to eliminate it entirely.

- Making the Window Title Bar Invisible

Making the title bar invisible is the safer method, because the changes you make can easily be undone. And although the title bar is invisible, it's still there and can be dragged. However, this method works only in color, and in color you lose HyperCard's visual effects.

Here's how to set the Desktop, and the window title bar and its components, to the same color -- making the title bar invisible:

1. Put the cdev called Kolor (Kolor is available on bulletin boards) in your System Folder.
2. Open the Control Panel, then click on the cdev named General.
3. Click on the dark blue color where it says "Desktop Pattern."
4. Color in the box above the word "Desktop" so it is solid blue.

5. Double click on the dark blue color. A window will appear with a color wheel. Write down the values in the Red, Green, and Blue fields.
6. Click on the cdev Kolor.
7. In the window title bar section, click on the "Title text" square. This will bring up the color wheel again.
8. Change the values in the Red, Green, and Blue fields to match the numbers you wrote down in step 5.
9. Repeat steps 7 and 8 for the "Lines/boxes," "Border," and "Title bar" squares.

Your title bars now appear to be invisible when shown against the Desktop Pattern.

- Eliminating the Window Title Bar

Eliminating the title bar actually changes the window structure. It has nothing to do with color, so it has effect on large-screen monochrome systems as well as color systems. This procedure changes HyperCard itself, so back up HyperCard first. The information here is given for versions through 1.2 of HyperCard.

1. Use a file editor such as Fedit Plus to open the HyperCard application.
2. Do a search for one of the following hexadecimal strings:

```
HyperCard 1.01: 05A0 2F3C 0004
HyperCard 1.1:  05DC 2F3C 0004
HyperCard 1.2:  0638 2F3C 0004
```

which should occur only once in the HyperCard file.

3. Change the last character of this string from 4 to 2.
4. Save the change and exit the file editor.
5. When you run HyperCard, the window will no longer show the title bar.

If you need to restore the window title bar, use the file editor to change the 2 back to 4. The parameter that was changed is passed to the Toolbox Window Manager call NewWindow. The value 4 tells NewWindow to draw a document window (with title bar) without a grow box. The value 2 tells NewWindow to draw a plain box without a menu title bar.

X.25 Protocol: Using It With InterBridges

Revised: 6/1/89
Security: Everyone

X.25 Protocol: Using It With InterBridges

=====

This article last reviewed: 15 October 1987

The Question

Suppose you want to connect to a network based on the X.25 protocol. You may want to connect an InterBridge to their backbone zone, then connect the InterBridge via one of its modem ports to one of the ports on an X.25 pad located in the WHTC complex. The connection is to tie into another AppleTalk network that has been connected in a similar fashion at some other point in the X.25 network. Your concerns are:

- how to initiate the connection between two InterBridges across the X.25 bridge.
- the amount and size of packet traffic generated by two InterBridges polling each other's existence across the X.25 bridge.

Making the Connection

To initiate the communication between bridges, just turn on the InterBridge. It then polls the nearest bridge and updates its internal table of zones available on the net from the adjacent InterBridge. It also passes its zone address number and name to the other bridge. If a bridge is turned off, it will rebuild the zone table at power on. After a delay in rebuilding the table, it maintains the table on its own. Applications such as the Chooser and InBox, which communicate over AppleTalk, can request the zone information from the InterBridge. Bridges periodically update their tables and will, upon receiving a new zone address or a packet referencing an unnamed zone address with a name, will update the table to reflect the new zone address and zone name.

There is one consideration that may cause some applications not to function with this network. Because InterBridges use ZIP, which is "best effort" protocol, checking for timeouts or proper data handling must be handled by the application. Some applications, notably AlisaTalk running on a VAX, will time-

out if delays are very long across the network. You are then at the mercy of whatever traffic and traffic problems might exist on the X.25 net.

Packet Traffic

During the first 30 seconds of polling time, approximately 5-6 packets are transferred between InterBridges. These packets are in ZIP (Zone Information Protocol). The first will be a ZIP bringup packet that will be delivered out each of the connected ports. This is followed by a ZIP GetZoneList or GetMyZone packet. The GetZoneList packet is replied with a GetZoneList Reply packet. The new InterBridge might send a ZIP Query for information on packets whose addresses are not yet in its Zone Information Table (ZIT). This also will be replied and will be in the form of a ZIP reply packet.

The packets range in size: 8 bytes for a ZIP GetZoneList, 45 bytes for a ZIP bringup, 13 bytes plus 32 bytes for each zonename for a ZIP reply packet, and for a GetZoneList Reply there would be 9 bytes and 32 bytes for each zone name.

The first group of bytes contain the LAP (Link Access Protocol) header, the DDP Datagram Delivery Protocol) header, and the ZIP (Zone Information Protocol) header. This will be true for takedown, bringup, query, and reply packets. The ZIP GetzoneList and GetZoneList Reply packets use ATP (AppleTalk Transaction Protocol) header and user bytes. These transactions take place with each connected port.

There are two AppleTalk ports and two Serial ports on the InterBridge. After the initial polling, one packet each 10 seconds is transmitted to maintain the connection while idling.

Apple III: Keyboard layout

Revised: 11/15/84
Security: Everyone

Apple III: Keyboard layout

=====

Applications in development often require a particular keyboard layout. There are some problems during the creation of this file because the standard drivers manual doesn't provide enough information about the internal organization of a keyboard layout file. The easiest way to change the layout is to modify an existing keyboard file. The file is laid out in the order of the table on page 136-137 of the Apple III Standard Device Drivers manual. For example, the first eight bytes of the SHOLES layout are:

```
31 21 32 21 32 40 32 00
1  !  2  !  2  @  2  NUL
```

The four values, as presented in the table in the manual, are in the order: Alone, SHIFT, CONTROL, Both.

Apple FORTRAN: Complex Numbers and Character String Functions

=====

In learning FORTRAN, you sometimes have to simulate complex number functions without actually using CMPLX(A,B) (which takes the real number A and the imaginary number B and returns the complex number result) or AIMAG(A) (which returns the imaginary part of the complex number A). REAL Fortran77 brings an easy solution: use character strings and simple arithmetic, treating the real and imaginary parts of the complex numbers separately. Alas, the designers of Apple FORTRAN chose not to include the character string functions and procedures.

The following hints at a solution; an end-user wanted to print character strings in the graphics page using WSTRING(string), which also wasn't implemented.

The small assembly language function below returns the ascii value of the nth character of a string. Frustrated Apple FORTRAN programmers will find this useful.

For the complex function other such routines might need to be written; a length-of-string and an index function would be very helpful.

```
;
;      Function CHAR1 (string,N)
;
;      returns ASCII value of Nth character in string
;
;      William B. Judd, TRI, 10/27/83
;

ProDOS: Problems using the CONVERT program in 80 columns

Revised: 11/15/84
Security: Everyone

ProDOS: Problems using the CONVERT program in 80 columns

=====

The CONVERT program malfunctions if it is executed when the 80 column display is active. The top lines are scrambled and ProDOS date and prefix aren't displayed.

Here are two possible bypasses:

1. Exit from the 80-column card firmware with ESC-CTRL-Q, then execute CONVERT.
2. Enable 40-column display with ESC-4, then execute CONVERT.

In both cases you restore the 40-column screen, and the program works correctly.

This situation occurs in the following configuration:

1. ProDOS Developer's Disk V 1.0 C
2. ProDOS system file dtd 01.11.83
3. Convert program version 1.1, dated 01.11.83
4. System configuration: Apple IIe and Extended 80-column card.

SOS: Error messages

Revised: 11/15/84
Security: Everyone

SOS: Error messages

=====

Here are some Pascal III I/O errors reported (in Volume 2 of the programmer's manual) as SOS errors and which cannot be found in the SOS Apple Technical Communications Manual. The remarks are general and made without knowing the circumstances, applications or languages involved.

36: Device not available = SOS error \$24

Error \$24 means that a device like a printer is not on-line, although a driver that will return this error is not known.

44: Invalid byte count = SOS error \$2C

Error \$2C means that a SOS call from an application didn't have the appropriate parameter list for the call.

45: Invalid block number = SOS error \$2D

Error \$2D means that the application is asking for a block past the end of the disk. This has occurred with System Utilities. There the problem is that some program, perhaps Apple Writer, changes the directory or index blocks on the disk so that the file points off the end.

Extended 80-column card: Applesoft

Revised: 11/15/84
Security: Everyone

Extended 80-column card: Applesoft

=====

Supplied with the Extended 80-column text card supplement, the ERRATA sheet tells programmers not to use the INPUT and GET statements in Applesoft when using the 80-column card. In fact, the Applesoft INPUT statement will work fine with the 80-column card. The GET statement will not put the cursor where it belongs on the screen. This is because GET does not use the monitor routines the way the 80-column card should be used.

CP/M: Cursor addressing

=====

Below is a table for the Cursor commands required when using CP/M 2.21 on the Apple III. Note that all of the commands are offset by 128 decimal. This prevents CP/M BDOS from interpreting control codes (Tab for example) in the cursor command sequences.

Command	AIII Dec	AIII Hex	CP/M Dec	CP/M Hex
Turn Screen ON	15	0F	143	8F
Turn Screen OFF	14	0E	142	8E
Normal Video (White on Black)	17	11	145	91
Inverse Video (Black on White)	18	12	146	92
Lead-in, Cursor Addressing	26	1A	154	9A
Horizontal (X-Axis) Offset	0	0	128	80
Vertical (Y-Axis) Offset	0	0	128	80
Clear Screen (& Home Cursor)	28	1C	156	9C
Clear to End of Screen (From Cursor)	29	1D	157	9D
Clear to End of Line (From Cursor)	31	1E	159	9E
Clear line	30	1E	158	9E
Setup - Initialize Screen to 80x24	16 03	10 03	144 03	90 03
Home Cursor (Do Not Clear)	12	0C	140	8C

Note the Setup command; this places the console in 80x24 text format if it is not already there.

For additional information on the subject, refer to the Standard Device Drivers Manual supplied with the Apple III.

ImageWriter Manual Errata: Producing slashed & unslashed zeroes

Revised: 3/2/88
Security: Everyone

ImageWriter Manual Errata: Producing slashed & unslashed zeroes

=====

This article last reviewed: 15 November 1984

Page 42 of the Imagewriter User's Manual, Part 1, has reversed the commands for producing slashed and unslashed zeros. The correct commands are:

Code	Decimal	Hex	Effect
ESC-Z	27 90	\$1B \$5A	Unslashed
CTRL-@ CTRL-A	0 1	\$00 \$01	

To print unslashed zeros, send: CHR\$(27);CHR\$(90);CHR\$(0);CHR\$(1).

ESCAPE D	27 68	\$1B \$44	Slashed
CTRL-@ CTRL-A	0 1	\$00 \$01	

To print slashed zeros, send: CHR\$(27);CHR\$(68);CHR\$(0);CHR\$(1).

Once the Imagewriter has received your instructions, it will continue to follow them until the printer is turned off. Therefore, you may use a word processor or other application program to print slashed or unslashed zeros after setting up the Imagewriter appropriately.

If Applesoft sends codes directly to the printer, zeros may be printed as you desire, but other side effects, such as double line spacing, may occur.

The sample program below sends the appropriate codes to the Imagewriter through a small machine language routine. This bypasses Applesoft's setting the high bit which may cause the Imagewriter to interpret information incorrectly.

```
10 POKE 768,169 : POKE 769,0 : POKE 770,32 : POKE 771,237 : POKE
    772,253 : POKE 773,96
20 D$ = CHR$(4)
30 PRINT D$;"PR#1"
40 PRINT "LINE ONE - 0000 - NO SLASHES"
```

```
50 REM SEND CODES TO SLASH ZEROS
60 PRINT CHR$(27);"D"; : POKE 769,0 : CALL 768 : POKE 769,1 : CALL 768
70 PRINT "LINE TWO - 0000 - SLASHES"
80 REM SEND CODES TO UNSLASH ZEROS
90 PRINT CHR$(27);"Z"; : POKE 769,0 : CALL 768 : POKE 769,1 : CALL 768
100 PRINT "LINE THREE - 0000 - NO SLASHES"
110 PRINT D$;"PR#0"
120 END
```

Apple III: RETURN and ENTER

Revised: 11/15/84
Security: Everyone

Apple III: RETURN and ENTER

=====

In order to differentiate being the RETURN and ENTER keys on an Apple III, you need to redefine the keyboard layout table to command the console driver to return two bytes with every request for a character. While we cannot obtain a document of the format of the keyboard part of the driver, the diagram on page 165 in conjunction with the diagram on page 135 of the Standard Device Drivers manual shows what information is returned in the two byte mode. The ENTER key will return \$0D just like RETURN but the second byte will have bit 7 set.

Beware that after enabling the double byte read from Business BASIC, an invokable module is required for text. Two GET statements won't work.

Macintosh: Calculating the Draw Rate

Revised: 10/19/87
Security: Everyone

Macintosh: Calculating the Draw Rate

=====

This article last reviewed: 14 October 1987

Apple is often asked about the "draw rate" of Macintosh computers. If the question is "how many pixels per second?" the answer is "it varies." This is explained below. If the question is "how many vectors per second?" the answer is "the Macintosh doesn't use vector processing."

This article explains how graphic images are produced on both the Macintosh and on vector graphics terminals, and shows why there's no constant "draw rate" for the Macintosh.

Vector Graphics vs Bit-mapping

Vector graphic (line drawing) systems evolved from the basic plotter design that was first used for displaying computer graphics. To conserve memory (remember when memory was expensive?), only two points are stored for each line. The display image is calculated, during a screen refresh, by image generating hardware. Entire images can be stored on a mainframe or mass storage device and off-loaded to a terminal for processing.

The Macintosh uses a different technology, bit-mapping, which deals with an array of pixels mapped into RAM. A new image is displayed as fast as the bit-map RAM is updated; there is no need to calculate vectors. Storing the pixel information requires a great deal of memory. A monochrome image requires one bit per pixel; a color pixel requires several bits to specify its color (pixel mapping). Because a display like that of the Macintosh II contains 307,200 pixels (640 x 480), a minimum of 37.5 Kbytes is needed for a monochrome display. The same display using 8 bits per color pixel would need about 300 Kbytes.

Bit-mapped images, once stored, are updated at the speed of the vertical refresh rate, which is 66.67Hz on the Macintosh II video card. This means a full screen of video information (307,200 pixels) is displayed 1/66.67 times per second 14.5ms and a horizontal line (480 pixels) takes only 1/35,000 of a second .0285714ms (35KHz scan rate). (The actual number of

pixels is slightly more as there are black borders where the beam is off.)

Calculating the Draw Rate

To calculate the time it takes to draw a given line, you must define where and when on a system the drawing of the line occurs. On a vector graphic system, the vectors are calculated (by a graphics generator) and sent to an image processor (video circuitry) for calculation of lines. Eventually they are converted by video circuitry to a display.

On a Macintosh, the "graphics generator" consists of the CPU and QuickDraw routines. The image is stored in video memory as a pixel map that is displayed by the video card circuitry. No further modeling is needed at the video card.

In both cases, to determine the time required to draw a line, a starting point and end point are needed. A number of other events can influence the timings and that will not accurately describe a working situation. This is not to imply that the two methods, pixel mapping and vector graphics, can or should be compared in this manner -- they're two different technologies. The benefit of pixel mapping lies in the finer control of each pixel for color or even video (analog) image processing at high speeds -- something not available through vector graphics processing.

Kinds of Graphics Generators

A graphics generator is a dedicated processor (or host) that calculates and stores graphics information in some format, not necessarily similar to what will be displayed. A video processor is the circuitry that examines and converts graphics data into signals for the actual display. The examined data on vector graphics systems needs an added function of the video processor for the purpose of calculating the points between the end points as well as outputting the display signals.

Some of the possible methods (there are endless permutations) of generating graphics on a CRT:

- A graphics generator (dedicated or computer system) mixed with live video sources and even stored video sources with output to a display monitor and possibly a transmission and/or recording device.
- A standalone graphics system connected directly to a monitor.
- A host computer connected to a monitor. Usually, update times limit the practicality of using graphics terminals to alphanumeric or vector displays.
- A host computer connected to a graphics terminal that has its own processor to handle the graphics calculations.
- A host computer connected to a graphics controller that is connected to a monitor. The display information is fed to the controller for channeling to the needed device.

One of the options being used with small non-graphics dedicated computers is to place a graphics generator on a controller card with a video processor. The purpose of this is to free up the system CPU from the graphics handling tasks that it shares with the various system tasks.

The Macintosh II uses a host computer to graphics controller configuration with the storage of the RGB pixel information directly on the controller/video card. Other pixel maps can be created in the main memory of the Macintosh as well. This is useful for fast updates of the video card's pixel map. All logical maps or QuickDraw records are stored in main memory. This refers to the calculated pixels that are then transferred to the video card memory for updating of the display pixel map.

The Bottom Line

Now, to face the question of how long it takes to draw a given line. Because a Macintosh actually displays pixels, not lines, the question can't be answered with a simple number. The display times as noted above the display are themselves updated as fast as the Macintosh II CPU, running at 16Mhz, can calculate the line. This is still not display time, since it has to be combined with the time to transfer the calculated bits to the video card. The transfer time is not much of an issue when lines are the question, because very little information needs to be transferred. NuBus, the connection between the Macintosh II CPU board and the video card, can transfer 2.7 MBytes per second. Because a line in monochrome video mode might have 67 dots to the inch, only 67 bits need to be transferred. This doesn't take into account transfer protocol information and size of the data path on the NuBus.

The question then narrows down to "how long does it take QuickDraw to calculate a 1-inch line?" When you consider the other processes that must go on during an application:

- memory management
 - vertical blanking interrupt processes
 - interrupts from external devices
 - the location of the line and its relation to other graphic entities
- you begin to see why there is no single definition of the time it takes to draw a given line.

RS-232: Applefile III and QuickFile III

Revised: 11/15/84
Security: Everyone

RS-232: Applefile III and QuickFile III

=====

Applefile will not recognize an .RS232 driver configured as a character read-write device (\$63). If .RS232 is changed to a write only device (\$41), Applefile recognizes it and shows it under the printers available. If an RS-232 device is a write only device, the handshaking, XON/XOFF or ETX/ACK, will still function. XON/XOFF and ETX/ACK are not data per se and will be treated as handshaking. Therefore, a driver will still be found if it is configured as a write only device such as a printer, since the driver does not have to READ the printer. These same modifications will allow QuickFile III to use the .RS232 driver.

MacTerminal and LisaTerminal: Line feeds after carriage returns

=====

It is the job of the sending device to provide line feeds after carriage returns if necessary. For example, when you're using your Macintosh to send text to another Macintosh, you must select New Line (a Terminal Settings option from the Settings menu); otherwise, the user on the other end will receive all the incoming text overwritten on one line.

In LisaTerminal, set Auto New Line to "on" to SEND a line feed after a carriage return. Auto New Line is an option in the Computer Compatibility box located in the Setup menu.

- A. SNA/SDLC: IBM 3274, 3276 MOD 12
- B. BSC: IBM 3276 MOD 2

3. Devices Emulated:

- A. Terminals:
 - 1. SNA/SDLC: IMB 3278-2
 - 2. BSC: IBM 3277
- B. Printer: 3287-1

4. Physical Unit Type: SNA/SDLC: PU (1-7 LU's)

5. Device Address:

- A. SNA/SDLC: PU2, address switch selectable
- B. BSC: Switch selectable

6. Transmission Speed:

- A. Full Duplex: Up to 9600 bps
- B. Printer: 300 to 9600 bps, Full duplex flow control (X-on/X-off)

7. Interface:

- A. Asynchronous:

- a. Seven-bit ASCII
- b. Full duplex
- B. Synchronous:
 - a. 8-bit EBCDIC

8. Power Requirements: 115 AC, 1 amp, 50/60 Hz

9. Physical Connection:

- A. Synchronous port: Serial high-speed synchronous modem
- B. Asynchronous port: Serial interface (DTE or DCE) for:
 - a. computer
 - b. printer
 - c. modem

10. Data Security:

- A. Monitors data flow from each port in both directions
- B. Automatically terminates when the transmission is interrupted

11. Diagnostics:

- A. A diagnostic line monitors every port
- B. Self-diagnostic test programs that may be run at any time
- C. Complete system test at power-on
- D. Results displayed on the Status Line

12. Environmental Requirements

- A. Operating temperature: 50 to 90 degrees F (10 to 35 degrees C)

II. Package

NOTE: For Datacomm approved dealers only

Order Numbers: Search on "Cluster" in the Product Prices Library

Apple IIe: Stopping the blink of the cursor

Revised: 11/15/84
Security: Everyone

Apple IIe: Stopping the blink of the cursor

=====

There are two ways to stop the blinking cursor on the IIe.

1. If you have an 80-column card, do a PR#3 and then an ESC 4. This uses the 80-column firmware but in 40-column mode.
2. If there is no 80-column card installed on your system, do a
POKE 49162,0:PRINT CHR\$(4)"PR#3". This has the same effect.

In the 80-column firmware, the cursor is an inverse blank. This effectively removes the flashing cursor.

Macintosh: Changing Font Size in Menu Bars

=====

This article last reviewed: 14 October 1987

At the end of this article is the MPW Assembly source code for an Init file that, when placed in the System Folder, modifies three low memory globals at startup.

The Init changes the System font from Chicago 12 to Chicago 14, the largest font that doesn't cause distortion in dialogs and buttons. (You must, of course, have Chicago 14 installed in the System file.) Menu bars and window title bars will change in size based on the values you supply.

Warnings: This method of changing the size of the system font is not recommended, but is the easiest way to change the font size of the menu bar with existing System files. The Init has been tested with few applications, but may not work with all programs. It makes direct calls to hardware locations and may not work with future versions of hardware or of system software.

For more information, see:

- the Font Manager Chapter of Inside Macintosh, volume III
- the Menu Manger Chapter of Inside Macintosh, volume V

Here is the source code for the ChangeFont Init:

```
; Source for an Init that will change the system default menu bar size to other
; than chicago 12 point. By Jim Mensch

Apple II FORTRAN: Double precision arithmetic

=====

Usually, in FORTRAN IV & 77, the way to handle numbers up to 10 to 11 significant figures is to declare double precision variables or implicit double precision variables.

The new strategy here is to use the Pascal SANE unit linked to a FORTRAN program following the instructions in the Apple FORTRAN Language Reference Manual Chapters 15 and 16. Double precision poses more difficult problems. With the advent of the SANE package there are solutions possible. In short, such Pascal units are not available and must be written and created by the FORTRAN user.

TIFF (Tag Image File Format): Specifications (5 of 7)

=====

This article last reviewed: 12 February 1988

5. The Fields, continued

Threshholding

Tag = 263 (107)

Type = SHORT

N = 1

1 = a bilevel "line art" scan. BitsPerSample must be 1.

2 = a "halftone" or "dithered" scan, usually of continuous tone data such as photographs. BitsPerSample must be 1.

3 = Error Diffused.

Default is Threshholding = 1.

CellWidth

Tag = 264 (108)

Type = SHORT

N = 1

The width, in 1-bit samples, of the dithering/halftoning matrix. Assumes that Threshholding = 2. That is, this field is only relevant if Threshholding = 2.

No default.

CellLength

Tag = 265 (109)

Type = SHORT

N = 1

The length, in 1-bit samples, of the dithering/halftoning matrix. Assumes that Threshholding = 2. This field and the previous field may be useful for converting from halftoned to true gray level data.

No default.

Photometrics

These fields are useful in determining the visual meaning of the sample data.

MinSampleValue

Tag = 280 (118)

Type = SHORT

N = SamplesPerPixel

The minimum valid sample value.

Default is 0.

MaxSampleValue

Tag = 281 (119)

Type = SHORT

N = SamplesPerPixel

The maximum valid sample value.

Default is $2^{(\text{BitsPerSample})} - 1$.

PhotometricInterpretation

Tag = 262 (106)

Type = SHORT

N = 1

0 = MinSampleValue should be imaged as white. MaxSampleValue should be imaged as black. If the bit-map represents gray scale, then the values between the minimum and maximum sample values should be interpreted according to either the gray scale response curve information (if included) or according to the result of some more arbitrary rule. See GrayResponseCurve.

1 = MinSampleValue should be imaged as black. MaxSampleValue should be imaged as white. If the bit-map represents gray scale, then the values between the minimum and maximum sample values should be interpreted according to either the gray scale response curve information (if included) or according to the result of some more arbitrary rule.

2 = RGB. In the RGB model, a color is described as a combination of the three primary colors of light (red, green, and blue) in particular concentrations. For each of the three samples, MinSampleValue represents minimum intensity, and MaxSampleValue represents maximum intensity. For PlanarConfiguration = 1, the samples are stored in the indicated order within a pixel: first Red, then Green, then Blue. For PlanarConfiguration = 2, the sample planes are stored in the indicated order: first the Red sample plane, then the Green plane, then the Blue

plane.

The Red, Green and Blue intensity values are defined according to the NTSC specifications for primary color chromaticity. These specifications assume the illumination to be CIE D6500. See the Red, Green and Blue color response curve tags.

Note: some compression schemes, such as the CCITT schemes, imply a particular PhotometricInterpretation. Therefore, when reading such data, TIFF readers should ignore PhotometricInterpretation. And, ideally, TIFF writers should not write out the field when using one of these schemes.

No default.

GrayResponseUnit

Tag = 290 (122)

Type = SHORT

N = 1

1 = number represents tenths of a unit.

2 = number represents hundredths of a unit.

3 = number represents thousandths of a unit.

4 = number represents ten-thousandths of a unit.

5 = number represents hundred-thousandths of a unit.

Default is 2.

GrayResponseCurve

Tag = 291 (123)

Type = SHORT

N = 2**BitsPerSample

The purpose of the gray response curve and the gray units is to further provide photometric interpretation information for gray scale image data. The gray response curve specifies for given levels of gray between the minimum and maximum sample values the actual photometric gray level of the value. It represents this gray level in terms of optical density.

The GrayScaleResponseUnits specifies the accuracy of the information contained in the curve. Since optical density is specified in terms of fractional numbers, this tag is necessary to know how to interpret the stored integer information. For example, if GrayScaleResponseUnits is set to 4 (ten-thousandths of a unit), and a GrayScaleResponseCurve number for gray level 4 is 3455, then the resulting actual value is 0.3455.

If the gray scale response curve is known for the data in the TIFF file, and if the gray scale response of the output device is known, then an intelligent conversion can be made between the input data and the output device. For example, the output can be made to look just like the input. In addition, if the input image lacks contrast (as can be seen from the response curve), then appropriate contrast enhancements can be made.

The purpose of the grey scale response curve is to act as a "lookup" table

mapping values from 0 to $2^{**\text{BitsPerSample}}-1$ into specific intensity values. Refer to the PhotometricInterpretation tag to determine how the mapping should be done.

Macintosh Finder: Reasons for Slow Operation

=====

Article Created: 2 November 1987
Article Last Reviewed: 2 February 1991
Article Last Updated:

TOPIC -----

What could make the Finder run slowly?

DISCUSSION -----

A slow Finder is not caused by the size of the disk, but by the size of the Desktop file. The size of the Desktop file is not directly related to the number of files it contains, but to the number of icons and file comments.

The number of icons is related to the number of applications. Slow operation becomes a problem for hard disks with more than 50 applications. The number of comments is a problem only for those who add a comment to every file and folder. This is typical with public domain software. To remove all comments, you can rebuild the Desktop file in one of two ways.

- You can delete the Desktop file in ResEdit.
- You can hold down the Command and Option keys while you start up your computer.

These operations remove the comments and speed things up appreciably.

Apple 300/1200 Modem:Using one from within BASIC on an Apple II

Revised: 8/3/89
Security: Everyone

Apple 300/1200 Modem:Using one from within BASIC on an Apple II

=====

On page 3 of the Modem 300/1200 User's Manual, "Part II: Guide to Apple II", you're told to set SW2-2 on the Super Serial Card (SSC) to the OFF position. This isn't entirely correct.

Setting the switches this way causes the SSC to send data in 7 data bits and 1 stop bit, whereas Apple modems are only equipped to handle data in 8 data bits and 1 stop bit. This situation causes no problems if you're using Access II or AppleTerm. These terminal programs override the switch settings on the SSC, and send data to the modem in 8 data b; and 1 stop bit no matter what the switches on the SSC are set to.

It DOES cause problems, though, if you're using BASIC with your modem, since BASIC has no such override capability. When you use BASIC with your Apple modem, the switches on the Super Serial Card must be:

SW2-1 ON
SW2-2 ON

Tape Backup 40SC: Problems with HD Setup (9/93)

Revised: 12/1/93
Security: Everyone

Tape Backup 40SC: Problems with HD Setup (9/93)

=====

Article Created: 6 November 1987
Article Reviewed/Updated: 27 September 1993

TOPIC -----

The Tape Backup 40SC Owner's Manual (copyright 1987, 030-5571-A) clearly states on page 29, "Important: Back up and restore to the same device. Don't back up one hard disk and restore to another".

IMPORTANT COMPATIBILITY NOTES:

- The bundled software included with the Tape Backup 40SC is Tape Backup 40SC 2.0.1, which is INCOMPATIBLE with System 7 and later.
- Apple recommends using third-party backup software with the Tape Backup 40SC. Some third-party products that work with the Tape Backup 40SC are Retrospect and Retrospect Remote from Dantz Development Corp., and FastBack Plus from Fifth Generation Systems. Further, using of these applications will not cause the problem detailed below.

DISCUSSION -----

Here is a more in-depth explanation of the manual statement:

When using the Apple Tape Backup 40SC and Tape Backup 40SC 2.0.1 software to do a "Volume" backup, be aware of several factors. The tape backup program puts a "mirror" image of the hard drive onto the tape. In other words, the backup software starts at sector 0 and continues reading to the end of the hard drive. During this process, the backup software writes the data to the tape, sector by sector; any and all bad sectors are written onto the tape as well. This method of backup also copies information such as boot blocks, volume size, and the volume directory.

When the "Restore Volume" command is selected, the software checks the tape for the size of the volume it is going to restore. You are now prompted to select the volume you want to have restored. At this point, the tape backup program verifies that both volumes are exactly the same size. If the volume you are

restoring to is smaller than the volume on the tape backup, you get an error message and the backup program won't allow you to continue. If the volume you are restoring to is larger than the tape backup volume, you'll be able to restore, but the volume will appear to be the same size as the original volume. For example, after backing up a HD 20SC using the backup "Volume" option, then restoring it to a HD 40SC, the HD 40SC will appear to have a total of only 20 megabytes of storage.

Different versions of the HD Setup program format Apple hard drives with various amounts of total capacity. HD Setup 1.0 and 1.1 format hard drives with the same number of blocks. HD Setup 1.2 give a different number than 1.0 and 1.1, while HD Setup 1.3 and 1.4 yield yet another different number of blocks. The numbers of blocks also depends on the physical size of the disk (e.g. 5.25" vs 3.5") or manufacturer.

Apple HD Setup 1.4 and later versions format all hard drives of like capacity with the same number of blocks.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

AppleWorks: Printing a Text File

Revised: 8/10/87
Security: Everyone

AppleWorks: Printing a Text File

=====

The Appleworks option to print to "a text (ASCII) file on disk" does not put carriage returns at the end of each line. It is designed to let the user create a file which can be used with other (ASCII) word processors.

If you want to use Appleworks for electronic mail or other applications which require a carriage return at the end of each line, here's how:

From the Main Menu,

Choose "5. Other Activities."

Choose "7. Specify Information about your Printer."

Choose "2. Add a Printer."

Choose "4. Apple Silentype."

Name the printer "EMail" (or name of your choice).

Choose "7. Print onto disk or on another Apple."

Press Escape 3 times to return to the Main Menu.

Now, when you wish to print a file to disk with carriage returns at the end of every line, choose the printer "EMail."

Note: The Apple Silentype was chosen for the "EMail" printer because it accepts no printer control codes. Therefore, the file that is created contains only text with the appropriate carriage returns.

NOTE: This works for IIIEasy Pieces as well.

Pascal : STRING and CHAR concatenation

Revised: 11/15/84
Security: Everyone

Pascal : STRING and CHAR concatenation

=====

To concatenate using STRING types and CHAR types and not get a type mismatch error, use the routine below to create a STRING containing the CHARacters the user wishes to add to the STRING, then use the Pascal CONCAT to put them together. Make sure that if this is done within a PROCEDURE or FUNCTION, and the STRING is passed as a parameter, that the (*\$V-*) option is used as well as declaring a TYPE to pass rather than STRING.

```
TYPE STR_TO_PASS = STRING;

PROCEDURE WHATEVER (ST : STR_TO_PASS);
BEGIN
END;

here's the concat stuff ...

PROGRAM CONCAT_CHAR;

CONST LEN = 4;                      { or whatever you want }

VAR TEST_STRING : STRING;
    CH : CHAR;
    I : INTEGER;

(*$R-*)      { turn Range Checking off so you can }
              { alter individual cells of the string }

BEGIN
    TEST_STRING[0] := CHR(LEN); { set length of string }
    FOR I := 1 TO LEN DO
        BEGIN
            READ (CH);
            TEST_STRING[I] := CH;
        END;
    WRITELN;
    WRITELN (TEST_STRING);
END.
```

Apple Writer IIe under DOS 3.3: Printer codes from all Apples

Revised: 4/30/86
Security: Everyone

Apple Writer IIe under DOS 3.3: Printer codes from all Apples

=====

Many printers have special features that the computer signals by sending command codes. To send codes to a printer from Apple Writer IIe under DOS 3.3, you must insert the codes into the Apple Writer file you want printed. The manual of the printer may list the codes by several names: decimal, hexadecimal, teletype abbreviations (SOH, ETX, DC1, DC3, etc.), standard keys, and combinations of the above.

Using the chart "ASCII characters, values, and keystrokes", you have to translate from the name of the code in the printer manual into the name of the corresponding keystroke or keystrokes on the keyboard of the Apple IIe, Enhanced Apple IIe, or Apple IIc.

Some keystrokes put so-called control characters into the Apple Writer file. These control characters are not part of the conventional English character set; while screen shows them, the printer intercepts and does not print them, instead recognizing them as signals to turn special functions on and off or to change printer settings.

NOTE: In the descriptions of the keystrokes, the characters greater than and less than, < and >, are used to contain one keystroke, which can mean that:

1. You must simultaneously hold down the control key, the shift key, or both as you press the other key, or
2. You must press a special key, such as ESC or RETURN.

With these considerations in mind, here is a list of codes and methods for inserting them in an Apple Writer file.

Null (ASCII value 0):

The following patch is for Apple Writer IIe under DOS 3.3. The patch allows you to enter NULs (CTRL-@) when in CTRL-V mode. The only side-effect is that the DELETE key doesn't work for correcting a filename entered from the keyboard for the DOS COMMANDS or ADDITIONAL FUNCTIONS menu; instead, just use the left arrow key.

--Boot the DOS 3.3 System Master diskette.

--Remove the System Master diskette, insert the Apple Writer IIe under DOS 3.3 diskette and type the following commands.

```
BLOAD OBJ.APWRTIIE
CALL -151
1CE1:EA EA EA EA
3EBA:EA EA EA EA
3D0G
UNLOCK OBJ.APWRTIIE
BSAVE OBJ.APWRTIIE,A$1900,L$2F58
LOCK OBJ.APWRTIIE
BLOAD OBJ.APWRTIIF
CALL -151
1D81:EA EA EA EA
4033:EA EA EA EA
3D0G
UNLOCK OBJ.APWRTIIF
BSAVE OBJ.APWRTIIF,A$1900,L$30D1
LOCK OBJ.APWRTIIF
```

If you don't want to do this to your Apple Writer IIe diskette, refer below to the Applesoft BASIC solution.

Control-A through Control-Z (ASCII decimal values 01 through 26):

Example: Control-Z (ASCII decimal value 26): <CTRL-V><CTRL-Z><CTRL-V>

Exception: Control-V (ASCII decimal value 22) can't be entered.
See "Missing Characters" below.

Escape (ASCII value 27): <CTRL-V><ESC><CTRL-V>

Other Control characters: These can be entered in the manner of Control-A through Control-Z.

Missing Characters:

You can't directly enter a Control-V in Apple Writer. To use these and other characters in Apple Writer, it is necessary to use an Apple Writer glossary file.

Apple Writer doesn't send a Null character.

Applesoft BASIC can be used to send a Null character to your printer.

1. Create your Apple Writer document as usual, but substitute a unique character in each place that you want a Null character.

2. Type <CTRL-P> to display the Print/Programs Command menu.

3. Type PD8, Apple Writer's code for Print to Disk on an Apple II.

4. Type NP to begin printing.

5. To the Apple Writer prompt for a file name, do not enter the same name with which the file is already saved. Enter a unique name, and note it down.

6. After the printing to disk is finished, exit Apple Writer and boot up a ProDOS diskette.

7. Run the following program:

```
100 HOME
110 PRINT TAB(10);APPLE WRITER TO PRINTER"
120 VTAB 5
130 INPUT "NAME OF APPLE WRITER FILE PRINTED TO DISK: ";F$

Apple III COBOL: Using CALL and CANCEL with subprograms

Revised: 11/15/84
Security: Everyone

Apple III COBOL: Using CALL and CANCEL with subprograms

=====

When a linkage section is used between a calling and a called program and there is I/O (disk read/write, etc.) in the called program, the file I/O instructions are not successfully executed by the called program. Also, the "Cancel" verb does not seem to always free up the entire amount of memory allocated to subprograms.

Page 85 of the COBOL Manual states, " If you are not careful in Call/Cancel sequences, you can fragment memory, leaving no room for a new Call, even though the total amount of free memory might be enough." Page 86 says, " There is one more complication to consider: any program can be segmented. When you Call a segmented program, The Run-Time System allocates for it enough memory to hold the root segment and the largest overlay." What this all means is that all memory is returned with Cancel but fragmentation could be the problem. A Called module requires contiguous memory to be loaded.

ImageWriter: First printed line is expanded or crunched

=====

When you print a file on the Imagewriter, sometimes the first printed line at the beginning of the paper is crunched or expanded. This problem sometimes occurs after you take the paper out of the platen: you may have left the tractor gears in a position "between linefeeds". Solve this problem by doing a form feed right every time you reload the printer with paper.

Sometimes the paper is not held tight enough by the rollers, especially when you use cut sheets. Solve the problem by "burping" the printer: turn the printer off and on so the printhead moves back and forth and the gears are tightened.

Using Lisa 2.0 Files With Lisa 7/7

=====

When you open a document with a Lisa application, there must be enough disk space to retain the original document while you work - in the event you later choose "revert to previous version." Even more disk space is required to enable you to use "undo." This is why you may see the message "Not enough room to open file" when you try to read a Lisa 2.0 document stored on diskette by Lisa 7/7. If this happens, move the document to the hard disk, where you are likely to have more free storage space. You should then be able to work on your document with no problems.

Apple Modem: Using one from within an Applesoft BASIC program

Revised: 8/3/89
Security: Everyone

Apple Modem: Using one from within an Applesoft BASIC program

=====

If you wish to use an Apple Modem from within an Applesoft BASIC program, you must write your own software to do so; you must be prepared to read each character you send, though, since the Apple Modem echoes each character sent through it.

Following is an example routine for dialing a number. NOTE: this routine is only meant to illustrate how to read each character after sending it. The routine does dial a number, but this routine cannot stand alone: notice how it ends without completely flushing the input from the modem.

```
10 D$ = CHR$(4)
20 S$ = "AT D123-4567"
30 PRINT D$;"PR#2"
40 PRINT D$;"IN#2"
50 FOR I = 1 TO LEN(S$)
60 PRINT MID$(S$,I,1);
70 GET X$
80 NEXT I
90 PRINT
100 PRINT D$;"PR#0"
110 PRINT D$;"IN#0"
```

WARNING: When trying to access the modem from the program, if you use PRINT CHR\$(4);"PR#2" and/or PRINT CHR\$(4);"IN#2", followed by CTRL-A T, the computer hangs and BASIC program control is lost. That's because once you send a CTRL-A T, the firmware takes over and is in control until you type CTRL-A Q.

To send AT commands to the modem, send only the "PR#2"; then, using a PRINT statement, you may send whatever you wish. For example:

```
10 D$ = CHR$ (4)
20 PRINT D$; "PR#2"
30 PRINT "ATDT1231234"
40 END
```

will dial 123-1234. You could also replace line 40 with

```
40 PRINT D$; "IN#2" and add,  
50 PRINT CHR$ (1); "T"
```

and you'd be in terminal mode.

Business Basic III: Distinguishing between RETURN and ENTER keys

=====

Using an invokable module (which you'd have to write), it is possible to detect whether the key pressed is located on the keypad or the main keyboard, and thereby distinguish (if you wish) between the RETURN key and the ENTER key. The Standard Device Drivers manual provides information on how this is done, particularly in Appendix G and in the chapter on the Console driver.

Also, Volume #1, Issue #1 of a magazine named "On Three" contains a program for recognizing the difference between the ENTER and RETURN keys. You can obtain a copy by writing to:

Business BASIC III: Random Access File Problem

Revised: 11/15/84
Security: Everyone

Business BASIC III: Random Access File Problem

=====

In Business Basic, if you open TWO random access files and then try to access some of the records, you get a SOS CALL ERROR 22. This error occurs, for example, in line 511 of the following sample program:

Enter the record number 723 for A%, and anything for B%;
enter anything for A\$ and B\$ on the first entry;
enter the record number 723 for A%, and anything for B%;
the system crashes with a "SOS CALL ERROR 22".

```
10 OPEN#6, ".PROFILE/FILE1",15
20 OPEN#7, ".PROFILE/FILE2",15
25 CATALOG ".PROFILE"
30 INPUT "Enter A% ";A%
40 INPUT "Enter B% ";B%
50 ON EOF#6 GOTO 500
60 READ#6,A%
70 R=0:IF TYP(6)<>4 THEN GOTO 510
80 READ#6;A$
90 IF R=0 THEN 520
95 INPUT "Enter A$ & B$";A$,B$
100 WRITE#7,B%;A$
110 WRITE#6,A%;B$
120 GOTO 25
500 PRINT"Nothing in the file":OFF EOF#6:GOTO 70
510 PRINT"Nothing in the record":R=1
511 CLOSE#6
512 OPEN#6, ".PROFILE/FILE1",15
513 GOTO 90
520 END
```

If, however, you add the following lines, the program seems to continue to work normally:

```
5 ON ERR GOTO 1000
1000 PRINT"Error# "; ERR
1010 OFF ERR
```

1020 GOTO 512

Use this workaround to avoid any further problems.

DOS Tool Kit Assembler

Revised: 11/15/84
Security: Everyone

DOS Tool Kit Assembler

=====

Here's an undocumented fact about the DOS Tool Kit: If you have assembled a relocatable file and are then trying to run it from a BASIC program, make sure that the BASIC program file name does not begin with the same characters as your relocatable file. An example of what to avoid:

```
Relocatable file = Relocate Example.OBJO
BASIC file       = Relocate
```

If you make this error, the following BASIC program (named Relocate) will fail and display the error message "Undefined statement at 5".

```
10 ADDRS=0: REM PRE ALLOCATE VARIABLE TABLE
20 PRINT CHR$(4); "BLOAD RBOOT" CALL 520
30 ADRS=USR(0),"RELOCATE.OBJO"
40 CALL ADRS
```

Simply by changing the name of the relocatable file to Example.OBJO, and changing line 30 in the above program as follows, you can correct the problem.

```
30 ADRS=USR(0),"EXAMPLE.OBJO"
```

AppleWorks: Problems with calculations in spreadsheets

Revised: 8/10/87
Security: Everyone

AppleWorks: Problems with calculations in spreadsheets

=====

If, in cell A1, you enter the formula $17.9-17*10$, the cell will display 9, the correct result. If you then enter, in cell A2, `@INT(A1)`, the cell will display 8. Even if you try the `@IF`, the result will always be something less than 9.

This phenomenon is not the application's fault: it's that old standard floating point error. Remember that $17.9-17$ isn't .9, but rather .899999, so that when you multiply by 10, you get 8.99999--and `@INT(8.9999) = 8`. The best workaround is to use `@INT(A1+0.5)` instead.

AppleTerm: Using it with a IIfc or IIfc

Revised: 5/25/89
Security: Everyone

AppleTerm: Using it with a IIfc or IIfc

=====

If the AppleTerm program refuses to address a modem when a printer is attached to another port or card, check that the printer is turned on and selected. If so, everything should work right. If the printer isn't turned on or selected, and is yet still connected to the port or card, then the modem won't work: the program sends an initialization procedure to the printer, and if it doesn't get something back from the printer firmware, it will hang. Usually what happens is that a "@" appears in the upper left corner of the screen.

NOTE: This same problem will occur if the printer interface isn't on an Apple Super Serial Card: AppleTerm will only acknowledge an Apple SSC.

Scribe Printer: What Kinds of Paper to Use (10/93)

Revised: 10/20/93
Security: Everyone

Scribe Printer: What Kinds of Paper to Use (10/93)

=====

Article Reviewed/Updated : 20 October 1993

TOPIC -----

What kind of paper can I use in the Scribe printer?

DISCUSSION -----

Tests of continuous feed papers for the Scribe Printer have shown that most smooth finish papers are acceptable, whether fanfold or single-sheet.

If you wish to use other papers, keep in mind that although no specially-coated paper is necessary, it's nevertheless true that the smoother the paper, the better the print quality. Even standard pin-feed and copying machine papers (such as Xerox 4024 copy paper) yield satisfactory results; avoid using rougher-textured papers, though, such as personal stationery or papers with a high rag content.

EtherTalk Card: A Description (Discontinued)

Revised: 6/7/94
Security: Everyone

EtherTalk Card: A Description (Discontinued)

Article Created: 9 October 1987
Article Reviewed/Updated: 26 June 1992

TOPIC -----

This article should answer some of the questions that you've been asking about the EtherTalk card: what it is and what it does.

DISCUSSION -----

What It Is

The EtherTalk card is a low-level transport mechanism that allows a variety of protocols to be transported over an Ethernet network. This means that the EtherTalk card addresses itself only to the lower two layers of the ISO reference model: the physical layer and the data link layer. The upper layers of the session are controlled by whatever protocol you wish to implement over these two lower layers. Two examples of upper layer implementations: AppleTalk and TCP/IP.

What It Does

The card, using a software driver, places these upper layer protocol packets in the data field of the Ethernet transport frame. The Ethernet frame properly addresses these packets to their 'target' devices, which strip off the frame and then process the packet inside. On the Ethernet wire, no device really cares what is contained in the frame unless that frame is directed at that device. This means that you can have devices using different upper layer protocols (such as TCP/IP, XNS, or AppleTalk) on the same physical wire. These encapsulated packets can co-exist on a single Ethernet without interference, because the devices don't look at what's inside unless the packet is directed specifically at that device.

The software shipped with EtherTalk is a driver for the Macintosh operating system. This driver lets AppleTalk packets be redirected to the

EtherTalk card rather than the printer port. The EtherTalk card then encapsulates the AppleTalk packet in an Ethernet frame, for delivery to a device on the Ethernet that understands AppleTalk packets. An example: a Macintosh II running AppleShare with EtherTalk as a 'server,' and a Macintosh II with EtherTalk as 'workstation.' Both devices are directly connected to Ethernet and use Ethernet only as a physical connection with delivery assurance and error correction.

This card can also be used to encapsulate other upper-level protocols with an Ethernet frame, for transport on the network. An example: the TCP/IP support under A/UX. Here, the Ethernet frame is the same as used in the earlier example, but the packet in the frame is TCP/IP rather than AppleTalk.

It's possible to use other protocols, such as XNS, with the same card and using the same Ethernet frame. The only thing that changes is what's in the frame.

Using Ethernet, it's also possible to have one device 'push' more than one protocol over the same physical connection. An example: a VAX running VMS, with AlisaTalk and DECnet installed. AlisaTalk will deliver AppleTalk packets to the VAX, which will encapsulate them with an Ethernet frame and send them out onto the Ethernet network. The VAX can also 'push' DECnet packets encapsulated in the Ethernet frame over the same card and physical connection. This happens serially, because Ethernet is a baseband network. In the example, the AppleTalk packet goes out first, followed by the DECnet packet over the same wire, following the rules of CSMA/CD, which provides the delivery assurance and error correction.

AppleShare: Copy-Protection and Locked Files or Folders

Revised: 10/4/89
Security: Everyone

AppleShare: Copy-Protection and Locked Files or Folders

=====

This article last reviewed: 10 May 1989

AppleShare 1.0 and 1.1

AppleShare 1.0 and 1.1 do not provide a mechanism to prevent users from copying files from an AppleShare volume.

Locking folders with these versions will not prevent someone from moving the folder elsewhere on the volume.

AppleShare File Server 2.0 or Later

You can Lock folders but you cannot copy-protect them. Locking prevents renaming, discarding, or moving the folder elsewhere on the volume. Locking does not affect access privileges. Only the folder's owner can enable or disable the folder lock option from the Access Privileges window.

Files can be locked and/or copy-protected. Locking a file prevents renaming, discarding, or saving any changes to the file but does NOT prevent someone from moving, copying, or opening the file. You can lock a file from the finder within the Get Info window.

When a file is copy-protected, users are unable to copy or duplicate it in the finder. Users with access privileges could still open a copy-protected document and using the Save As function could make a copy of the document -- defeating the copy protection.

The copy-protection feature is most useful for preventing copying of applications, to comply with copyrights and licensing agreements. Copy-protection can only be set with AppleShare Administration software within the file information window.

ProDOS: Error 900 When Using Apple IIf Sys Utilities Disk (9/95)

Revised: 9/19/95
Security: Everyone

ProDOS: Error 900 When Using Apple IIf Sys Utilities Disk (9/95)

Article Created: 17 December 1984
Article Reviewed/Updated: 19 September 1995

TOPIC -----

I started up my system with the Apple IIf System Utilities Disk. This disk has a new port configuration saved to it. If I select any menu option then press the Escape key to return to the main menu, I always drop into the monitor with Error #900 displayed. How can I get around this?

DISCUSSION -----

The workaround is as follows:

Step 1

Duplicate your Systems Utilities disk: select the main menu option 5. Boot your system with this new copy.

Step 2

Select main menu option 9 to exit from System Utilities.

Step 3

From the Basic prompt, type in the following:

```
Load SU,S6  
List 900
```

You will see the listing:

```
900 Call 768: Poke 216,0: Onerr Goto 930
```

Step 4

Change line 900 to:

```
900  Poke 216,0: Onerr Goto 930: Call 768
```

Step 5

Enter the following commands to unlock the file, save the changes to disk and relock the file to prevent accidental damage:

```
List 900
```

Step 6

Check once again that line 900 reads properly as in step 4, then type:

```
Unlock SU,S6
```

```
Save SU,S6
```

```
Lock SU,S6
```

Apple Desktop Bus (ADB): Specifications (12/94)

Revised: 12/8/94
Security: Everyone

Apple Desktop Bus (ADB): Specifications (12/94)

Article Created: 23 October 1986
Article Reviewed/Updated: 08 December 1994

TOPIC -----

This article provides specifications and information about the Apple Desktop Bus, which was introduced with the Apple IIGS and has been used in Macintosh computers since the introduction of the Macintosh SE and Macintosh II.

DISCUSSION -----

The Apple Desktop Bus (ADB) is a standard for input devices connecting to the Apple IIGS and later Macintosh computers that follow the Apple Desktop Bus protocol. Because the Apple Desktop Bus is run by an intelligent microcontroller, a number of different types of input devices may be connected to the ADB simultaneously: the computer's keyboard, mouse, tablet, light pen, second keyboard, or joystick.

Each device has a unique bus address, so that the ADB microcontroller may direct its commands to a particular piece of equipment. The ADB specification supports up to a maximum of 16 unique devices, however it is suggested that only 3 devices be connected to each ADB bus in order to prevent signal degradation problems from appearing. On the Apple IIGS, the control function is performed by the M50740 Keyboard Microcontroller. It uses a superset of the 6502 instruction set, and contains 96 bytes of RAM and 3K bytes of ROM. The Macintosh may use one of several different implementations which are documented in the Guide to the Macintosh Family Hardware manual published by Addison Wesley.

When the microcontroller requests input from a device, it sends a signal to the input device to "talk". If no return input information action (key pressed, mouse movement, button clicked, etc.) has occurred, the microcontroller keeps waiting for the device to respond until a time-out occurs.

The host may also instruct a device to "listen" to data being sent on the bus from the host. All devices on the Apple Desktop Bus must include the intelligence to respond to both talk and listen commands.

The Apple Desktop Bus uses a 4-pin mini-DIN jack and a 4-wire cable, with serial interface signals. When appropriate, the input device will have two ADB jacks, so that devices may be daisy-chained from the host. The Apple Desktop Bus Mouse does not have a second connector, so it must be at the end of the chain.

SPECIFICATIONS:

- throughput: approximately 154 bytes per second
- cable length: maximum 5 meters
- cable capacitance: maximum 100 picofarads per meter

ADB devices may use the +5 volt power supplied by the bus, but must not draw more than 500 mA total for all devices.

The Apple Standard Keyboard draws a maximum of 100 mA, and the Apple Extended Keyboard draws a maximum of 85 mA.

All devices are connected in parallel, using the signal, power, and ground wires. Due to connector resistance and signal degradation, daisy-chaining more than three devices is not recommended.

ProDOS: Filenames and directories

Revised: 8/6/86
Security: Everyone

ProDOS: Filenames and directories

=====

This article provides background information on files and directories. Refer to your ProDOS User's Manual for a more comprehensive discussion of these conventions.

Filenames

While DOS 3.3 allows you to save a file with a file name that has a tilde for the first character, ProDOS is much more strict:

- Only fifteen characters
- Only the letters A-Z, numbers 0-9, and a period
- Only a letter for the first character
- No control characters

Some acceptable filenames are:

PotatoSalad
SillyProgram
Biz.letter
Memo.1.April.84

Some unacceptable filenames are:

Potato Salad	- can't have spaces
Ridiculousprogram	- too long--greater than 15 characters
Emily'sPoem	- apostrophes aren't legal characters
Memo: Bill	- colons and spaces are illegal characters

If you forget these rules: for example, you leave a blank in the middle of a filename, your program beeps and the cursor won't budge until you type a character that is acceptable.

Directories

When a volume is first formatted, it gets a name and a directory. Anything you save on that volume is accessed through that directory. The directory

is also a file, but it just tracks where other files on the disk are stored. You could say that a directory file is like an address book.

There comes a time -- especially with a mass storage disk -- when it's convenient to have a way of organizing your files so you find such things as financial forecasts without listing the contents of the entire disk.

Subdirectories allow you to group your files logically. A subdirectory is just like a directory except that it's subordinate to the directory.

In the directory for the disk, you can create a subdirectory with the name "Financial", and in this subdirectory you create the subdirectories with the names "Forecasts" or "Statements". This kind of arrangement is called a hierarchial file structure because files are organized into successive levels.

ProDOS: Pathnames and prefixes

Revised: 8/6/86
Security: Everyone

ProDOS: Pathnames and prefixes

=====

Pathnames

A pathname is the volume directory name, followed by any number of subdirectory names, followed by the filename. The entire pathname is preceded by a slash; furthermore, each name within the pathname is separated by a slash. This slash is called a delimiter.

To get to a particular file, ProDOS looks at the pathname for the volume directory name. ProDOS then finds that volume and looks in the volume directory for the location of the next subdirectory in the pathname. ProDOS then looks in that directory for the location of the file. You can have as many subdirecories as you want as long as the total number of characters in the pathname dosen't exceed 64.

Prefixes

You may not want to type a complete pathname every time you want to locate a file. ProDOS can store a partial pathname, called a prefix. This prefix stores care of as many subdirectories as you wish; you only type the rest of the pathname, such as the filename. ProDOS appends this after the prefix, completing the pathname, and then looks for the file you want.

To set a prefix with the ProDOS User's Disk: 1) boot from this diskette, 2) enter the filer, 3) select P from the filer menu, and 4) enter your prefix, the first character of which should be a slash.

When a you want a file and you want to use the prefix you've entered, don't type a slash for the first character, just type the rest of the pathname, e.g. the filename.

When you want a file and you want ProDOS to ignore the prefix you've entered, type a slash for the first character. This does mean, however, you have to type in the complete pathname, starting with the volume name.

Lisa: Error Tones

Revised: 11/15/84
Security: Everyone

Lisa: Error Tones

=====

Some systems (usually those containing old ROMs) emit a low-high error tone upon startup before starting the internal diagnostics. To proceed, merely power the Lisa off and back on.

Other errors, ones usually associated with hardware failures, sometimes appear on Lisas in the 7/7 Office System. Typically, you may have neglected to erase your hard disk before installing the 7/7 Office System. After you safely backup your documents, reinstall the software after first erasing the present contents of the hard disk.

Business Basic III: VARIABLE ERROR in version 1.1 and earlier

Revised: 3/4/85
Security: Everyone

Business Basic III: VARIABLE ERROR in version 1.1 and earlier

=====

The most common cause for a variable error in versions 1.1 and earlier of Apple III Business Basic is to use SWAP with at least one of the arguments set to a null string: doing so creates an error in the string variable storage area. Unfortunately, these versions of Business Basic don't notice this error until they run short on storage space and try to consolidate all free space; the variable error occurs when the consolidation routine finds the swapped null string. The following fragment of code will generate this error:

```
10 T$ = "The little red fox jumped over the lazy dog's back ten times."  
20 PRINT "Length of T$ is " LEN(T$); TAB(40); "Length of B$ is " LEN(B$)  
30 SWAP T$, B$  
40 PRINT "Length of T$ is " LEN(T$); TAB(40); "Length of B$ is " LEN(B$)  
50 PRINT FRE
```

This problem has been fixed in versions 1.2 and later.

Brother Printer: Printing from AppleWorks (9/95)

Revised: 9/19/95
Security: Everyone

Brother Printer: Printing from AppleWorks (9/95)

Article Created: 17 December 1984
Article Reviewed/Updated: 19 September 1995

TOPIC -----

This article describes printing tips to use with a Brother Printer when printing from AppleWorks using an Apple IIc or IIe computer.

DISCUSSION -----

Since the Brother printer requires certain escape sequences to include a CTRL-I, the escape sequences in the Brother Manual may have to be modified in order to avoid interface cards from "trapping" the CTRL-I in the card. This occurs in the following situations:

1. Apple IIe with Super Serial Card -- add the following IN FRONT OF THE NORMAL SEQUENCE: <CTRL-I> Z RETURN
2. Apple IIc -- add the following IN FRONT OF THE NORMAL SEQUENCE: <CTRL-I> Z
3. Apple IIe with Apricorn parallel card and parallel Brother printer -- add the following IN FRONT OF THE NORMAL SEQUENCE: <CTRL-I> <CTRL-A>

Also, Brother's 10-pitch command requires a carriage return as part of the sequence, which does not appear to ever get to the printer. Instead, use the "set to switch command" (<ESC>S) to get back to 10-pitch.

BEST DIP SWITCH SETTINGS FOR APRICORN PARALLEL CARD:

	1	2	3	4
ON	X			
OFF		X	X	X

These settings force an 80-column mode and turn off the screen while printing, just like the serial card does.

APPLEWORKS PRINTER CODES TO USE:

Interface Cards (version 1.2) -- none

10-pitch -- <ESC>S

12-pitch -- <ESC><CTRL-_><CTRL-K>

15-pitch -- Super Serial Card: <CTRL-I>Z<RETURN><ESC><CTRL-_><CTRL-I>

IIc: <CTRL-I>Z<ESC><CTRL-_><CTRL-I>

Parallel Card: <CTRL-I><CTRL-A><ESC><CTRL-_><CTRL-I>

6-LPI -- Super Serial Card: <CTRL-I>Z<RETURN><ESC><CTRL-6><CTRL-I>

IIc: <CTRL-I>Z<ESC><CTRL-6><CTRL-I>

Parallel Card: <CTRL-I><CTRL-A><ESC><CTRL-6><CTRL-I>

8-LPI -- <ESC><CTRL-6><CTRL-G>

Macintosh II: Problems With Limelight Projector

=====

Article Created: 29 September 1987
Article Last Reviewed: 6 July 1992
Article Last Updated:

TOPIC -----

I'm having problems using a Limelight projector with a Macintosh II. The resolution isn't very good.

DISCUSSION -----

There are two problems with connecting a Limelight to a Macintosh II video card:

1. The Macintosh II video card has a 15 pin DB-style female connector, whereas the Limelight has a BNC female input.
2. The Macintosh II video signals are 35KHz for horizontal frequency and 66.67Hz for vertical scan rate. To properly display the video signal, a bandwidth of 21 MHz for monochrome and 22MHz for color is needed. The Limelight projector has a bandwidth of 20Mhz and a horizontal auto lock maximum frequency of 33Khz

The first problem can be fixed with a specially configured cable. We wired a Macintosh video cable to split the green signal on pin 5 to a BNC connector. This cable allowed connection of both the monitor and the projector. Another solution would be to contact Arizona Covid or Extron Electronics. These companies manufacture break-out cables and converter boxes. In this case, it would merely be a cable change. Although some enhancements (vertical and horizontal picture centering or color enhancement) are included in their converter boxes, this is not particularly useful on a monochrome projector like the Limelight. Since screen position controls are also supplied on the projector, a converter will probably not be needed.

The second problem is not as easily dealt with without modifications to the projector. Since its circuitry can not accept higher frequency data rates, there is some image loss. Also, the plastic lens of the projector can't focus all parts of the screen clearly, resulting in a good deal of blurring on the edges. (A curved-back screen helps somewhat.) Though the Limelight specification claims a maximum of 33 KHz for the horizontal scan rate, the projector we tested was able to handle a full line of video from the Macintosh at 35KHz. This may be a specification set below the performance level on the projector -- however, the Macintosh scan frequencies were pushing the limits of the projector: it took very little adjustment to the horizontal control to lose the signal. A black box is not likely to sharpen the image by modifying the signals, since the problems are inherent in the projector's ability to handle the resolution. As it stands, with a break-out cable the projector does display the Macintosh II video, though the image may be objectionable to some.

Security: Everyone

EtherTalk: Ethernet Connectivity for the Macintosh II

=====

Article Created: 16 October 1987
Article Last Reviewed: 26 June 1992
Article Last Updated:

TOPIC -----

This is an article about EtherNet for the Macintosh.

DISCUSSION -----

Overview

EtherTalk demonstrates that AppleTalk is a network architecture independent of media type. EtherTalk increases AppleTalk's bandwidth significantly by using Ethernet, an industry standard medium. It also provides increased throughput for transmission-intensive applications while implementing the layered features and functionality of the AppleTalk architecture.

Installation

The EtherTalk card is easy to install and use. You don't need to worry about the Ethernet Link Access Protocol address assignments. Each EtherTalk card has a unique address, assigned at the factory and stored on the card. The driver automatically looks for and uses this address on an Ethernet network. (The network address is also printed on a label on the back of the board.)

Features

EtherTalk Macintosh OS software redirects AppleTalk packets from the printer port to the EtherTalk card. These packets are then encapsulated in Ethernet Link Access Protocol and then sent out onto the network. EtherTalk operates at speeds up to 10MBPS. The card can be configured for use on 'thick' or 'thin' Ethernet networks. (See the EtherTalk Interface

Card manual for configuration details.)

You can connect a LocalTalk node to the printer port with one or more EtherTalk cards installed, and switch between the printer port or any one of the EtherTalk cards. Only one AppleTalk path can be active at any one time, and the 'network' function in the control panel is used to select the active network. (See Chapter 2 of the EtherTalk User's Guide.) There is a limit of 254 active EtherTalk users (including bridges) on any one Ethernet.

Performance

EtherTalk improves AppleTalk throughput, depending on the level of 'foreign' Ethernet traffic and total available bandwidth. A practical expectation is an improvement of 1.3 to 3 times over LocalTalk connections, with a total capacity of 3 to 5 times that of LocalTalk networks.

Bridges

An EtherTalk Macintosh II can't act as a bridge between a LocalTalk network and Ethernet. It's possible to write bridging software, but none is included with the EtherTalk product.

AppleTalk Protocol Notes

EtherTalk under Macintosh OS implements AppleTalk according to Inside AppleTalk specification with some enhancements to allow operation on Ethernet networks. This means that Ethernet devices that don't implement these protocols and enhancements will be unable to 'see' the card on an Ethernet network. This is applicable only under Macintosh OS using AppleTalk protocol.

Under Macintosh OS, a special driver (.ENET) is utilized to 'push' packets onto the network. This driver is similar to the LocalTalk driver. Packets sent by this driver in AppleTalk mode are restricted to 768 bytes to allow encapsulation by an Ethernet LAP.

These packets will co-exist with TCP/IP, XNS or other Ethernet protocols on the same network without problem.

Macintosh Pascal 1.0: Screen Echo

=====

To defeat the echo to the screen when entering data from the keyboard, use the GET statement rather than the READ statement. For example:

```
Program No_Display(input, output);
Var
  i:integer;
  v:array [1..10] of char;
Begin
  i:=1;
  Writeln('Enter 10 Character Password:');
  While i <=10 do
    Begin
      Get(input);
      v[i]:=input^;
      i:=i+1;
    End;{while}
End.
```

Macintosh Pascal 1.0: Putting comments into the code

Revised: 3/24/87
Security: Everyone

Macintosh Pascal 1.0: Putting comments into the code

=====

Multi-line comments with a single pair of brackets are not allowed in Macintosh Pascal; instead, you must frame each line of the comment with its own set of brackets.

To work around the problem of using large blocks of comments within MacPascal, break up large blocks of comments with a valid Pascal statement. A declaration, begin or end statement, etc. will do the job, and the program can then be loaded normally. You might also try severely limiting the number of consecutive comments on lines by themselves.

There are no plans to change this situation, documented in the new version of the MacPascal Technical Reference manual.

The problem is easily duplicated by creating a Pascal "program" that contains nothing but comments. The key is the number of characters contained in the comments: 20 lines of about 70 characters per line should be sufficient. As long as comments reside on lines following an actual Pascal statement, the problem goes away. But this is not really practical or practiced. This will be submitted to Software Testing for further evaluation.

To create a Macintosh Pascal listing with any amount of comment information, cut and paste your code to another document; you can then add documentation to this listing as you please.

ImageWriter II: Faded Print Caused By Damaged Carrier Shaft

Revised: 10/21/87
Security: Everyone

ImageWriter II: Faded Print Caused By Damaged Carrier Shaft

=====

This article last reviewed: 21 October 1987

If an ImageWriter II is dropped or handled roughly, the carrier shaft bushing may break, allowing the carriage to pull away from the platen on one side. Output looks fine on one side of the paper, but gradually fades out as it moves to the opposite side of the paper. Adjusting the paper thickness lever doesn't cure the problem.

The carrier shaft bushing may appear intact, but if you look closer, the two small dimples that the shims mount to are probably fractured or broken off. Replace the broken carrier shaft bushing (958-0006).

Lisa 7/7: Installing OS 3.1 & Pascal Workshop 3.0 on Hard Disk

=====

To install Lisa 7/7 Office System 3.1 or 3.0 and Pascal Workshop 3.0 on a hard disk:

1. Backup any Office System or Macintosh documents from the hard disk.
2. Install the 7/7 Office System (release 3.0 or 3.1) as detailed in Chapter 6 of the Lisa Office System manual.
 - a. Select Erase when prompted.
 - b. Select Share if you wish to store Macintosh software on the hard disk
3. Install the Pascal Workshop as described in Chapter 1 of the Lisa Workshop manual. Select Don't Erase when prompted.
4. If you installed release 3.0 in step 2 above and want to upgrade to 3.1,
 - a. Get into the Workshop environment and insert the Release 3.1 Office System 2 diskette into the microdrive.
 - b. From the Workshop command line, type R.
 - c. When asked which file you wish to run, type: <-lower-StartUpdate.
 - d. Press the RETURN key.
 - e. You are then guided through the process of updating the system libraries. After answering a series of questions, follow the prompts to insert the necessary disks.
 - f. Since the update process changes the libraries on the startup disk,
 1. Restart the Lisa when you've completed step 4e.
 2. Replace the LisaWrite and LisaProject tools and stationary pads on the hard disk with the updated versions.

LaserWriter/LaserWriter Plus: External Pinouts (7/94)

Article Created: 29 May 1985
Article Reviewed/Updated: 12 July 1994

TOPIC -----

What are the external signals associated with the DB-25 and DB-9 connectors on the LaserWriter and LaserWriter Plus?

DISCUSSION -----

Here are the pinouts and signal names for the LaserWriter and LaserWriter Plus.

DB-25

Connector	Signal Name
1	Frame Ground
2	Transmit Data (Tx)
3	Receive Data (Rx)
4	Request to Send (RTS)
7	Signal Ground
20	Data Terminal Ready (Tx)

NOTE: The other signals are not used.

DB-9

Connector	Signal Name
1	Chassis Ground
3	Signal Ground
4	Transmit Data (Dx+)
5	Transmit Data (Tx-)
7	Data Set Ready (DSR)
8	Receive Data (Rx+)
9	Receive Data (Rx-)

NOTE: RTS and DTR are only present for the convenience of the computer that the

LaserWriter is attached to. You should use Xon/Xoff for flow control.

Macintosh: External Floppy Drive Connector Pinouts (5/96)

Revised: 5/15/96
Security: Everyone

Macintosh: External Floppy Drive Connector Pinouts (5/96)

Article Created: 29 May 1985
Article Reviewed/Updated: 15 May 1996

TOPIC -----

What are the pinouts for the External Disk Drive Connector?

DISCUSSION -----

The external floppy disk drive connector is featured on the Macintosh 128K, 512K, 512K enhanced, Plus, SE, SE/30, Classic, Classic II, IICx, IICI, IISI, Portable, and Performa 200.

A Macintosh 400K External Drive can be connected to the Macintosh 128K, 512K, 512K enhanced, Plus, SE, and Portable.

A Macintosh 800K External Drive or an Apple 3.5 Drive can be connected to the Macintosh 512K enhanced, Plus, SE, SE/30, Classic, Classic II, IICx, IICI, IISI, and Performa 200.

An Apple SuperDrive can be connected to the Macintosh SE (with SuperDrive upgrade), SE/30, Classic, Classic II, IICx, IICI, IISI, and Performa 200

An Apple Hard Disk 20 can be connected to a Macintosh 512K, 512K enhanced, Plus, and SE.

Begin_Table

Connector type: DB-19.

.	Pin	Name	Description/Notes
.	1	CGND	Chassis ground
.	2	CGND	Chassis ground
.	3	CGND	Chassis ground
.	4	CGND	Chassis ground

.	5	-12V	
.	6	+5V	
.	7	+12V	
.	8	+12V	
.	9	N/C	Not connected
.	10	PWM	Regulates speed of the drive
.	11	PH0	Control line to send commands to drive
.	12	PH1	Control line to send commands to drive
.	13	PH2	Control line to send commands to drive
.	14	PH3	Control line to send commands to drive
.	15	WrReq-	Turns on the ability to write data to the drive
.	16	HdSel	Control line to send commands to the drive
.	17	Enbl2-	Enables the Rd line (else Rd is tristated)
.	18	Rd	Data actually read from the drive
.	19	Wr	Data actually written to the drive

End_Table

Article Change History:

Macintosh 128K,512K,Plus: Keyboard connector pinouts

=====

Article Created: 29 May 1985
Article Last Reviewed: 30 June 1992
Article Last Updated: 30 June 1992

TOPIC -----

What are the pinouts for the RJ-11 connector used to connect the keyboard on the Macintosh 128K, 512K, and Plus?

DISCUSSION -----

Early Macintosh models used an RJ-11 (phone) connector for the keyboard. Note that all models since the Plus use the Apple Desktop Bus instead, and are incompatible with these cables and connectors.

Pin	Name	Comments
1	CGND	Chassis Ground
2	KBD1	Keyboard Clock
3	KBD2	Keyboard Data
4	+5V	

Connector Type: RJ-11 Connector, 4 pin male

WARNING: Macintosh Keyboard cable connectors are just like those used in modular telephones, but the cables themselves are not. Never connect these cables to your telephone, and never connect a phone cable to your Macintosh.

Modems overseas: Power, protocol and legal considerations

Revised: 5/29/85
Security: Everyone

Modems overseas: Power, protocol and legal considerations

=====

-- Power for a modem overseas

This is not a problem. Buy a grounded isolation transformer in the country of use, plug the modem's wall outlet transformer into this converter, and the modem's power supply regulates the voltage internally. You should thoroughly investigate the voltage and frequency of the power source, however.

-- Different Protocols

A number of overseas countries use the French standard "CCITT" protocol for modem communications. The systems of some countries may not be suitable for clean data transmission or may not allow communication except on specially conditioned lines.

-- Special Laws restricting data communication

German law, for example, requires a permit to use a communications device. You should acquaint yourself with any national, regional, or local laws or conditions on using modems.

MacWorks XL: Error on Hard Disk Startup

Revised: 6/5/85
Security: Everyone

MacWorks XL: Error on Hard Disk Startup

=====

A problem with the released version of MacWorks XL can be worked around, even though the exact cause is not clear as yet.

After installing MacWorks on a hard disk dedicated only to Macintosh files, you may get the following error during the boot process: the expansion card icon appears with an X through it and a 2 inside it. There may also be the number 90 below it.

At this point, you have a choice of starting up from one of two disks: hard or floppy. The system will start up fine after you click on the hard disk icon; however, you must make this choice each time for start up. If you unplug the Macintosh XL to clear parameter memory and then reboot, it works fine, directly booting from the hard disk. But the same error message appears the next time you boot.

There are two workarounds: the first takes more time and the second takes more equipment.

First workaround:

1. Install Lisa office system.
2. Set preferences to boot from the hard disk.
3. Re-install MacWorks.

Second workaround:

1. Install a parallel card.
2. Boot Lisa.
3. Set Preferences to Boot from the internal hard disk.

LaserWriter: Form feeds and blank pages

Revised: 9/21/87
Security: Everyone

LaserWriter: Form feeds and blank pages

=====

This article last reviewed: 7 June 1985

In Diablo 630 Emulation mode, the LaserWriter prints a page under two conditions: (1) when it reaches the end of a page, or (2) when it receives a form feed. The LaserWriter cannot detect the end of a document; it simply assumes that the document has come to an end when data stops arriving.

If the last page of a document isn't full and doesn't end with a form feed, the printer doesn't print it immediately; instead, it waits for a printer timeout, which occurs (1) as soon as the next document arrives, or (2) after 30 seconds, if no document arrives before that. You can avoid this delay by being careful to include a form feed at the end of your document's last page.

During printing there is a step called data preparation. In this step, the Laserwriter determines how many pages it takes to print the document. There is a possibility that one character, even a carriage return, will force the generation of a blank page at the end of the document. With MacWrite documents, the Laserwriter prints this last page first.

DuoDisk: Shield service and support notice

=====

Currently, all Duodisk mechanical assemblies are NOT being made with threaded screw holes in the bottom of the casing.

However, the first 5,000 Duodisks had those screw holes; they were used to mount the Duodisk mechanisms to the bottom case.

If one of the original mechanisms is replaced with a new mechanism that has no screw holes, the following parts will have to be ordered:

Part Number	Description	Quantity to Order
400-1604	Screw	4
415-1410	Screw	4
805-5000	Shield	1
860-0053	Washer, lock	4
860-0242	Washer	4

Whether or not the unit is covered by warranty or AppleCare, Apple will reimburse the Level I Service Center for the parts used in this action. In order to receive credit, please note 'Duodisk Installation' in the comments section of the SRO form.

If the Duodisk is out of warranty and is not covered by AppleCare, the 'Other' line in the warranty section of the SRO should be marked and 'Duodisk Installation' should be noted.

Monitor II: Wavy display and voltage regulation

Revised: 5/25/89
Security: Everyone

Monitor II: Wavy display and voltage regulation

=====

This article last reviewed: 7 June 1985

When a Monitor II starts to exhibit a wavy display, it may be attributed to overheating of the voltage regulator, IC601, mounted on the heat sink near the power transformer. If a voltage check shows the voltage regulator to be good, it may only fail while hot. Apple's Quality Assurance reports have indicated that this failure is directly related to the mounting screw that secures the voltage regulator to the heat sink. If the screw is loose, there is inadequate heat transfer between the heat sink and the voltage regulator and it fails prematurely.

When servicing the Monitor II, insure that the IC601 mounting screw is secured.

If you replace the IC601, be sure to use thermal compound or an insulator pad (P/N 725-0006) between the IC601 and the heat sink.

AppleWorks IIe: LaserWriter interface

Revised: 12/11/86
Security: Everyone

AppleWorks IIe: LaserWriter interface

=====

The following describes the connection between AppleWorks on the Apple IIe and LaserWriter.

I. Apple IIe

1. Super Serial Card (SSC)

A. Circuit Configuration

Near the internal cable (Part 590-0021) of the SSC there is a removable block of pins with a triangle on its top face. Make sure this jumper block is plugged into its socket so that the triangle points to the word `TERMINAL` printed on the card.

This configuration, called modem elimination, compensates for the standard RS-232-C pin assignments so that the internal cable through the appropriate pins.

B. Install the SSC in Slot 1 of the IIe Motherboard.

C. SSC DIP Switch Settings

SW1:	1	2	3	4	5	6	7	SW2:	1	2	3	4	5	6	7
				X	X X				X		X X				(ON)
	X X X	X								X X		X X			(OFF)

These switch settings are for: 9600 baud (SW1: 1-4), Printer Mode (5-6), Normal Clear To Send (7), 8 data bits and 1 stop bit (SW2: 1), no delay after CR (2), video off (3), 132 character line (4), auto-LF after CR (5), Disabled ACIA-CPU interrupts (6), and Normal Clear To Send (7).

No parity is set automatically in the Printer Mode.

II. The Connection

1. Cable

Serial and Communications Cable
(Part 590-0037)

From				To	
Super Serial Card				LaserWriter	
IIfx Back panel				DB-25 connector	
DB-25 connector				DB-25 connector	
signal	-	pin	wiring	pin	- signal
Frame Ground		1	<->	1	Frame Ground
Tx		2	<->	2	Tx (Transmit Data)
Rx		3	<->	3	Rx (Receive Data)
RTS		4	<->	4	RTS (Ready To Send)
Signal Ground		7	<->	7	Signal Ground
DTR		20	<->	20	Tx (Transmit Data)

2. Signal

1. Levels from Super Serial Card:

- a. True (asserted): 0 volts
- b. False: +5 volts

III. Apple LaserWriter Printer

1. Set the Selector Switch on the LaserWriter to "Special", which can be done without turning off the printer. In Diablo 630 emulation mode, the LaserWriter uses 9600 baud, XON/XOFF protocol, and no parity.

2. Check

To verify the connection, turn on the IIfx, video monitor, and LaserWriter. Boot AppleWorks and choose "Other Activities" from the Main Menu. Add a custom printer, naming it LaserWriter. Use these settings for this custom printer:

- | | |
|---------------------------------------|------------------------------------|
| 1. Needs line feeds after each Return | No |
| 2. Accepts top-of-page commands | Yes |
| 3. Stop at end of each page | No |
| 4. Platen width | 8.0 inches |
| 5. Interface cards | Control-I 80N Control-I X space E^ |
| 6. Printer codes | Yes |

The printer codes for the Diablo Emulation are in the LaserWriter Technical Description. If you specify no printer codes, the typeface

will default to Courier standard, 12 characters per inch, monospaced.

Return to the Main Menu and try to print a document.

Note: When you use the AppleWorks command Open-Apple-H for hard copy, you will have to print a document using Open-Apple-P before you may use the Open-Apple-H command again. This is because the command Open-Apple-H does not issue the form feed the LaserWriter needs to output the last page and clear its Diablo emulation settings.

AppleWorks: Printing Forms from the Database or Word Processor

Revised: 8/10/87
Security: Everyone

AppleWorks: Printing Forms from the Database or Word Processor

Some Appleworks printing jobs have a page length less than 11 inches for continuous tractor-feed envelopes or mailing labels.

With data base documents, most users define the page length from the printer options menu in each "Print a report" format (OA-O) of the database document that contains the label text.

1. Choose the data base document you want to print.
2. Press OA-P, choose a label report format, and then press OA-O. You're now in the Printer Options Menu.
 - a. Type PL (Paper Length). Enter a value equal to the vertical length, in inches, of a single form. Many labels are 1.0, 1.5, or 3.5 inches high; Appleworks accepts all these values as paper lengths.
 - b. Set the options PH (Print Header) and OM (Omit Line) to NO by typing the two letter code until the option reads NO.

With word processor documents, however, there are a few additional parameterss you must control in order to produce acceptable results when printing continuous forms: (1) automatic top and bottom margins, and (2) form feeds. Unless you take care to control these two parameters properly, the printer will usually produce documents that are either badly printed or altogether blank.

To avoid these problems, do the following:

1. Choose the word processor document you want to print.
2. Press the OA-O. This gets you to the Printer Options Menu.
 - a. Type PL (Paper Length). Type a single form's vertical length in inches. Many labels are 1.0, 1.5, or 3.5 inches high; Appleworks accepts these values as page lengths.
 - b. Make sure the Top and Bottom Margins are zero.

3. From the main menu, select item number 5, "Other Activities". This selection will display a menu with 7 items.
4. Select item number 7, "Specify information about your printer(s)". This displays a menu entitled "Printer Information".
5. Under the heading "Change printer specifications" you will find one or two printer names. Select the name of the printer you want to use.
6. Change item number 2 ("Accepts top-of-page commands") to NO.

AppleWorks will now print using the page length you defined in the printer options menu.

Lisa: Boot ROM Versions

Revised: 7/30/87
Security: Everyone

Lisa: Boot ROM Versions

=====

Many users have received notices telling them that they must upgrade to Rev. H CPU ROMs to run Pascal 3.0. THAT NOTICE WAS IN ERROR! Acceptable ROM versions include:

Lisa 2: D/A8 or H/A8
Lisa 2/10: F/88 or H/88

--The first (alphabet) character indicates the revision of the CPU ROM; the following two characters identify the I/O ROM.

Other CPU ROM versions, such as A, B, C, E and G, should definitely be upgraded. If a user insists on Rev. H CPU ROMs, or if you need to upgrade old CPU or I/O ROMs, order them from your Apple Regional Service Center. The part numbers are:

	CPU ROMs	I/O ROM
Lisa 2:	341-0175, 341-0176	341-0290
Lisa 2/10:	341-0175, 341-0176	341-0281

NOTE: The ROM versions are both stamped on the chip itself and displayed in the upper right corner of the Lisa's screen when you boot the system.

ProDOS Assembler Tools: Startup Sequence

Revised: 10/26/87
Security: Everyone

ProDOS Assembler Tools: Startup Sequence

=====

This article last reviewed: 22 October 1987

The ProDOS Assembler Tools disk doesn't start up exactly as described on page 15 of the manual. When an Apple II starts up, it looks for a file named PRODOS. After it finds and loads PRODOS, it runs the first file on the disk that has the suffix .SYSTEM in its name. On the ProDOS Assembler Tools disk, the first such file is BASIC.SYSTEM, but the one needed is EDASM.SYSTEM. Here's how to change the name of BASIC.SYSTEM so that EDASM.SYSTEM gets loaded first:

1. Make a copy of the ProDOS Assembler Tools disk.
2. Start up from the new disk.
3. When the Applesoft] prompt appears, type the following, pressing Return after each line:

```
] UNLOCK BASIC.SYSTEM  
] RENAME BASIC.SYSTEM,BASIC.SYS
```

4. Either restart the system, or type the following to start the assembler:

```
] -EDASM.SYSTEM
```

This tells BASIC.SYSTEM to load and run EDASM.SYSTEM. ProDOS Assembler Tools now starts up, as described in the manual.

Lisa 7/7: Problems printing proportional-spaced fonts on a DWP

Revised: 5/13/87
Security: Everyone

Lisa 7/7: Problems printing proportional-spaced fonts on a DWP

=====

Printing your Lisa 7/7 document in a proportional-spaced (PS) font, such as 12 Point, will yield the following results:

- A. If you're using a standard "fixed" printwheel, characters such as "w", "m" and "r" will be oddly spaced.
- B. If you're using a proportional-spaced print wheel, such as the Apple Modern 10/12 PS Printwheel, the odd spacing will be less apparent.

You can eliminate the odd spacing entirely by selecting a fixed pitch, such as 12 Point-15 Pitch, and using a fixed pitch printwheel, such as the Prestige Elite Printwheel.

AppleColor Monitor 100: Power Supply Board Fuse And Logic Board

Revised: 11/9/88
Security: Everyone

AppleColor Monitor 100: Power Supply Board Fuse And Logic Board

=====

This article last reviewed: 9 November 1988

--> If you receive an AppleColor Monitor 100 that has no power or no raster, a blown fuse, F601, on the Power Supply board may have caused the failure. This easily detected problem may be corrected by installing the 250V, 2A, slow-blow fuse which has been added to the AppleColor Monitor Service Price List under Replacement Parts (Service Programs Manual, Page 7.10.3). This fuse, part number 740-0204, is available immediately. Refer to the March Technical Procedures update for instructions for replacing the fuse.

--> In March 1985, Apple sent out AppleColor 100 Monitors with Rev. 0 of the service stock logic board. Later that month, though, the logic board was revised, and subsequent monitors were sent out with this new logic board--Rev. A. Rev. 0 and Rev. A logic boards are NOT interchangeable: a Rev. 0 logic board cannot be used to repair a Rev. A system, and vice versa. Dealers should therefore purchase Rev. A logic boards in order to be able to support the new monitors. Instructions for recognizing and replacing boards have been included in the AppleColor Monitor March 1985 Technical Procedures. The Rev. A logic board has been added to the AppleColor Monitor Service Price List under Service Stock and Exchange Modules.

NOTE: You will be reimbursed for repairs involving both fuses and logic boards in systems covered under warranty or AppleCare.

Daisy Wheel Printer: Using it with AppleWorks

Revised: 2/18/86
Security: Everyone

Daisy Wheel Printer: Using it with AppleWorks

=====

To use the Daisy Wheel Printer with AppleWorks, set the switches as follows:

	1	2	3	4	5	6	7	8
Front	X					X		
Switch	X	X	X	X		X	X	
	--- OPEN ---							

	OFF								OFF							
Rear	X	X	X	X		X	X				X	X				
Switches					X		X		X	X	X		X	X	X	
	1	2	3	4	5	6	7	8	1	2	3	4	5	6	7	8
	S2								S1							

The diagrams of these switches are presented as seen from the back of the Daisy Wheel Printer or Letter Quality Printer. The front switches are rocker switches; X means that that side of the switch is down. The rear switches are toggle switches; X marks the toggle.

The front switch settings are for 12 characters per inch (1-2), 11 inch form length (3-6), no carriage return line feed (7), and 6 lines per inch (8).

SUPER SERIAL CARD

	1	2	3	4	5	6	7		1	2	3	4	5	6	7
ON				X		X	X	ON	X			X			
SW1								SW2							
OFF	X	X	X		X			OFF	X	X		X	X	X	
	1	2	3	4	5	6	7		1	2	3	4	5	6	7

AppleWorks sends a carriage return code to the printer as part of the setup command. When the SSC sees this code and you have configured the SSC to add a line feed, the printed page gets one line more than AppleWorks has calculated for the page. This can lead to misprints, often called paper creep, which get worse with each successive page.

To work around this problem, set the SSC for no <lf> after <cr>

	ON	ON	5
SW1		SW2	X
OFF		OFF	
			5

Macintosh Pascal 1.0: creating and accessing data files

=====

Open data files with the Reset, Rewrite and Open commands listed on pages 9-3 thru 9-5 of the Pascal Reference Manual. When accessing your data file, be sure to use a proper name. The correct format for "title" is "VolumeName:FileName", where VolumeName is the name of the diskette on which your file resides and FileName is the name of the file (see page 9-25).

If you do not know the name of the volume or file, use the OldFileName function to search for the file; alternatively, create a new file with NewFileName. OldFileName allows you to choose from a dialog box the existing files on any number of diskettes. The returned string value from these routines can then be used in a Reset, Rewrite, or Open command. Refer to page 9-26 for additional descriptions of these functions.

A possible area of confusion is with the variable-reference parameter in the Reset, Rewrite and Open commands, "f". This variable-reference is a reference to the file being accessed--for example, the command Open(TheFile, "Volumel:Inventory") opens the file "Inventory" on the diskette named "Volumel" and sets the variable-reference "TheFile" so that it refers to that particular file. Commands such as Get(TheFile), Put(TheFile) and Close(TheFile), all access this file.

Macintosh Pascal: Printing

Revised: 9/11/86
Security: Everyone

Macintosh Pascal: Printing

=====

To print from your Pascal program, open the printer with the command `Rewrite(f,"printer:").` The commands `Write(ThePrinter,p1[p2,...,pn])` and `WriteLn(ThePrinter,p1[p2,...,pn])` cause the values represented by `p1`, `p2`, etc., to be sent to the printer (See pages 9-16 thru 9-20 of the Macintosh Pascal Reference Manual.). Since Pascal considers every peripheral device to be an external file, a program never directly accesses a driver.

From within a program, printing sends data to the printer via the serial port selected in the Chooser. A Laserwriter in the Diablo 630 mode (NOT over AppleTalk) can print the text as can any printer that functions serially on the Macintosh. Simply send the appropriate ASCII "escape" sequences for the specific printer and then send the ASCII text.

To print the width of the 15" ImageWriter, the user should determine how many characters are sent before sending a CR/LF, which in turn determines the length of the line.

A good example would be the "PRINTTEXTFILE" sample included on the Pascal disk, which includes a technique for setting up the printer so that it skips page breaks.

Macintosh Pascal: Accessing the Toolbox

Revised: 12/4/84
Security: Everyone

Macintosh Pascal: Accessing the Toolbox

=====

Apple does not support any Toolbox routine that is not a built-in Macintosh Pascal function or procedure documented in either the Reference Manual or the Technical Appendix. We can only refer you to the Inside Macintosh documentation. A brief description of "Inline", a routine which enables you to access the Toolbox, may be found on the Macintosh Pascal diskette in the text file named "InLines". Note: careless or erroneous use of the "Inline" facility can be fatal to your diskettes or data.

Macintosh Pascal: Memory Use by Programs

Revised: 7/30/87
Security: Everyone

Macintosh Pascal: Memory Use by Programs

=====

About 35K of memory is available not only for your program text, but for program variables, the program's pseudo-code representation, debugging information and libraries. The majority of your Macintosh memory is used to keep as much of Macintosh Pascal resident in RAM as possible in order to minimize disk I/O. On a 512K Macintosh or Lisa, only 64K is available, due to pointer size limitations.

Version 2.0 of Macintosh Pascal lets you write larger programs, depending on the contents of the program, of approximately 750 lines on a 128K Macintosh and 2,000 on a 512K Macintosh.

Inside Macintosh provides a brief introduction to memory management in the Macintosh in the chapter "Macintosh Memory Management: An Introduction". Macintosh Pascal uses the Macintosh memory in a slightly different way.

The 2.0 version of Macintosh Pascal includes new predefined procedures for manipulating relocatable objects. (A relocatable object is an object that can be moved within memory and is referred to indirectly by means of a handle.) Anyone using these procedures needs to have a basic understanding of how Macintosh Pascal uses memory.

Macintosh Pascal uses two main run-time data structures: the machine stack and the general stack. The machine stack grows downward from high memory. From the bottom of the application heap just above the master pointer area, the general stack grows upward. The second stack is actually a pointer object that has a base fixed throughout a Macintosh Pascal session. When either the interpreter or the user interface is running, its code segments are moved to the top of the application heap and locked. Thus, programmers who cause objects to be allocated in the heap must be very careful not to cause the objects to be locked down just above the general stack. This will almost always cause the interpreter to run out of memory and exit to the Finder. Similarly, objects should not be allowed to be locked down just below the code segments that are locked high.

Macintosh II NuBus Card: Heat Dissipation Specifications (10/94)

Revised: 10/12/94
Security: Everyone

Macintosh II NuBus Card: Heat Dissipation Specifications (10/94)

Article Created: 22 October 1987
Article Reviewed/Updated: 12 October 1994

TOPIC -----

This article contains Macintosh II NuBus Card heat dissipation specifications for internal and external power supplies.

DISCUSSION -----

If power is supplied only by the Macintosh II power supply, the heat dissipation allowed for Macintosh II NuBus cards is:

- an average of 15W for each of the six cards, or
- 90W overall

If external power is supplied to a card, the input power may exceed the nominal 15W provided by the Macintosh II power supply. In that case, additional information is needed from the external power supply vendor to verify that the total heat to be dissipated does not exceed 90W.

The heat dissipation tolerances given here are based on the need to have no more than a 15-degree Celsius rise over ambient temperature. The Macintosh II power supply is designed to protect the CPU from extremely high temperatures: it shuts down the system if the internal temperature rises above 65 degrees Celsius.

MacTerminal 2.2: Launching Error May Be Caused By CNFG (10/94)

=====

Article Created: 17 December 1987
Article Reviewed/Updated: 12 October 1994

TOPIC -----

There is a minor problem that occurs when a desk accessory or driver containing a resource titled CNFG is installed in the System file.

DISCUSSION -----

MacTerminal 2.2 does not check to see whether a particular CNFG resource belongs to the System or to a desk accessory within the System. As a result, users may see an error message when MacTerminal is launched. The message, though annoying, does not indicate any actual error.

Macintosh 128, Plus, SE and Macintosh II: RFI Emissions (10/94)

Revised: 10/12/94
Security: Everyone

Macintosh 128, Plus, SE and Macintosh II: RFI Emissions (10/94)

Article Created: 22 October 1987
Article Reviewed/Updated: 12 October 1994

TOPIC -----

This article provides RFI emission information for some Apple products.

DISCUSSION -----

The conductive emissions tests Apple has run on the Macintosh family include testing up to 600 MHz. Beyond that point, the emissions are not significant for FCC standards and all emissions levels fall within FCC regulations.

Each member of the Macintosh family has a switching power supply with emissions in the range 100 to 140 KHz.

Macintosh II

Because the Macintosh II has three clocks, there are three emission sources:

- The first is the system clock, at 31.33 MHz. Harmonics of that clock will be seen up to the 600 MHz limits of Apple testing.
- The second clock, with a base of 40 MHz, is used for NuBus communications. Since it is internally divided by 4 to provide the 10 MHz NuBus synchronous signal, the harmonics seen from this clock will be at 10 MHz intervals and are significant up to 600 MHz.
- The third source of RFI is the Macintosh II Video Card. Its clock runs at 30.24 MHz and will provide harmonics emissions up to Apple's 600 MHz limit.

Other Macintosh Models

The Macintosh 128K, Macintosh 512K, Macintosh Plus, and Macintosh SE have

emissions that are harmonics of the system clock, which runs at 15.75 MHz. These Macintoshes have emissions that are multiples of 15.75 MHz, ranging as high as 500 MHz.

Macintosh: "Not Enough Room to Duplicate" error (10/94)

Article Created: 18 July 1986
Article Reviewed/Updated: 12 October 1994

TOPIC -----

I am getting the message "Not enough room to duplicate" when I try to copy a file to my hard disk, even though there is plenty of room left on the disk.

DISCUSSION -----

The "Not enough room to duplicate" problem usually occurs when the invisible Desktop file has grown very large.

Rebuilding the Desktop file may help this situation:

1. Hold down the COMMAND and OPTION keys as your Macintosh boots up.
2. At the prompt for rebuilding the desktop, click OK.

This method of rebuilding the Desktop file (which keeps track of all the icons and their locations) rebuilds the file with only the current contents of the disk. Otherwise the Desktop file keeps copies of every icon, whether emptied from the trash or current on the disk, that the Desktop file has ever encountered, which can cause it to balloon to a large size.

Be aware that when rebuilding the desktop, you will lose any notes you have typed in the comment box in the Get Info windows of your files.

Macintosh: Multiple NotePads (4/95)

Revised: 4/4/95
Security: Everyone

Macintosh: Multiple NotePads (4/95)

Article Created: 4 January 1985
Article Reviewed/Updated: 04 April 1995

TOPIC -----

Is there a practical limit to the Note Pad file and if so, is there any way to work around this?

DISCUSSION -----

The practical limit of each page of a Note Pad is 248 characters, which limits the entire Note Pad to under 2K. If you find that the Note Pad has too few pages, you can create additional pads by means of the following procedure. Note the directions for System 7.5 at thebottom.

When the Note Pad's eight pages are filled up, rename its icon stored in the System Folder to something like "NOTE 1". A new pad is created the next time you choose Note Pad from the Apple menu. If you need to look at something in the original pad, just rename your current file to something like "NOTE 2", and rename your original file (NOTE 1) back to "Note Pad File". The next time you choose Note Pad from the Apple menu, you access the one you just renamed. You can continue creating storage files for notes in this fashion until the disk fills up.

Under System 7.5, you need to remove and/or rename the Note Pad File which resides at the root level of the system folder. The next time the Note Pad is opened, a new Note Pad File is created.

There are also shareware or freeware utilities which expand on the Note Pad concept by allowing more pages as well as scrolling text fields.

Macintosh: Mini DIN-8 to DB-9 Adapter Pinouts (10/94)

Article Created: 12 February 1986
Article Reviewed/Updated: 12 October 1994

TOPIC -----

This adapter cable is used to connect DB-9 cables to devices with Mini DIN-8 ports (such as on the Macintosh Plus or newer).

DISCUSSION -----

Circular 8	Signal	DB-9
1	HSKo (+12V)	6
2	HSKi	7
3	TXD-	5
4	GND	3,1*
5	RXD-	9
6	TXD+	4
7	No Wire	
8	RXD+	8

* Pins 1 and 3 on the DB-9 end are jumpered together.

The pins on the male end of the circular 8 connector are numbered as shown:

6 7 8
3 4 5
1 2

NOTE: The Macintosh Plus peripheral adapter cable is stamped with the number 590-0341; when reordering, however, be sure to use the cable's service part number, which is 699-0430 (older cables may be referred to as 699-0372).

Security: Everyone

Apple III Port C: RS-232-C Pinouts & Configuration (10/94)

Article Created: 04 December 1984
Article Reviewed/Updated: 12 October 1994

TOPIC -----

The following table explains how use System Utilities to configure the driver for the RS-232 port (Serial Interface and Serial Card III). Remember to set the slot number on the Serial Card III driver.

DISCUSSION -----

Data Configuration Blocks:

Data Configuration

Block Address: \$00

Baud rate:

110	\$03
134.5	\$04
300	\$06
600	\$07
1200	\$08
1800	\$09
2400	\$0A
4800	\$0C
9600	\$0E

Data Configuration

Block Address: \$00 \$01

Data Format:

Bits	Parity	
8	none	\$00
7	odd	\$22
7	even	\$26
7	MARK	\$2A
7	SPACE	\$2E

6	odd	\$42
6	even	\$46
6	MARK	\$4A
6	SPACE	\$4E

Data Configuration

			*	*	*								
Block Address:	\$00	\$01	\$02	\$03	\$04	\$05	\$06	\$07	\$08	\$09	\$0A	\$0B	
Comm Protocol:													
none						\$00							
XON/XOFF						\$80	\$13	\$11	\$DF	\$84		\$00	
ENQ/ACK						\$40	\$05	\$06			\$50	\$00	
ETX/ACK						\$40	\$03	\$06			\$50	\$00	
HW Handshake						\$00			\$DF	\$84		\$80	

* \$02 - Delay after CR

* \$03 - Delay after LF

* \$04 - Delay after FF

Delays (bytes \$02, \$03, and \$04)

Using this driver to connect to a printer may require that you set delay times while the printer advances to a new line or the top of a new page. These delays are given in the range \$00...\$FF characters. The RS-232 driver will wait for the time taken to transmit the amount of character specified before it sends the following character.

Pinouts:

DB-25

Connector	Signal Name	
1	Shield Ground	
2	Transmit Data	(Tx)
3	Receive Data	(Rx)
4	Request to send	(RTS)
5	Clear To Send	(CTS)
6	Data Set Ready	(DSR)
7	Signal Ground	
8	Data Carrier Detect	(DCD)
20	Data Terminal Ready	(DTR)

Serial Card III has a modem eliminator button; when this button is "in", the above pinouts are correct. If the button is "out", this has the effect of a modem eliminator cable being installed. (For more information on modem eliminator cables, search this database for MODEM AND ELIMINATOR.)

Pin Out Explanation

Pin 1 (FG) is used to provide a common ground reference for the electronics in both the ImageWriter and the device it is connected to. This pin is sometimes not connected. If there is an intermittent problem which can be cured by turning the IW off and on again, check the cable to see if pin 1 is connected. Pin 2 (TD) conveys serial data sent from the ImageWriter (EXAMPLE: If the IW's DIP switches are set for XON/XOFF flow control protocol then this line would send characters to the connected device to tell it when to start and stop transmission. This is one of the pins that may need to be crossed over if the peripheral device is a DTE. A modem eliminator cable can perform this crossover.

Pin 3 (RD) receives serial data sent from the device the ImageWriter is connected to. This is one of the pins that may need to be crossed over if the other device is a DTE. A modem eliminator can perform this crossover.

Pin 5 (RTS) is asserted whenever the ImageWriter is powered on.

Pin 7 (SG) provides a common electrical ground level that the devices can reference the RS232 signals to. This pin should always be connected.

Pin 14 (Fault) notifies the device connected to the ImageWriter that the ImageWriter has been deselected (the SEL lamp goes out). This can be due to normal events such as you pressing the SEL switch or paper running out or it can be due to a problem such as the ImageWriter's microprocessor experiencing a glitch.

Pin 20 (DTR) becomes active when the ImageWriter is ready to go on line. If the IW's DIP switches are set for the DTR flow control protocol, this line will go on and off to tell the connected device when to start and stop transmission. This is one of the pins that may need to be crossed over if the device connected is a DTE. The modem eliminator cable can perform this crossover.

Security: Everyone

AppleLine: How To Use With an Apple IIe or Apple IIc (10/94)

=====

Article Created: 04 November 1987
Article Reviewed/Updated: 12 October 1994

TOPIC -----

The following information has only been partially verified for the 3274-2.2 ROMs. Though this setup should work with the newer ROMs, this has not been confirmed.

DISCUSSION -----

Hardware Configuration:

Apple IIe
Super Serial Card in Slot 2. The jumper block should be set to terminal.
Straight thru cable - 590-0037
or
Apple IIc
Apple IIc-ImageWriter/Scribe printer cable.

Gender changer - 590-0214
Appleline - 699-0239 with version 2.2 of the ROMs.
Appleline wall mounting power supply - 970-0950
(optional - Loop Back Connector - 970-0879)

Software Configuration:

ProDOS 1.1.1
Apple Access II v 1.1
Set Access II as follows:
Terminal Characteristics
"Set ANSI Mode"
"Do NOT Send LF After CR" - for Supervisor mode
or
"Send LF After CR" - for 'On-Line' mode

```
"7 Bits per Character"
"Enable XON/XOFF"
"Normal Video"
"Full Duplex"
"No Wraparound"
Set Speed - "2400 baud"
Set Parity - "Even"
```

Appleline Configuration:

```
Terminal Type....."VT100"
Baud Rate....."2400"
Parity....."Even"
Autobaud....."Enabled"
Speed Indicator....."Disabled"
Modem type....."Local Connect"
Auto Logoff....."Disabled"
Special Terminal Capability..."None"
24/25 Line Automatic Toggle..."Disabled"
```

Notes

- 1- Set Access II for 2400 baud. 4800 & 9600 seem to overrun it.
- 2- The autobaud sequence is OpenApple-B Return (OA-B Return).
- 3- If you use 8 bits per character, set parity to None in Access II and on the Appleline.

For more information on VT-100 keypad sequences, see Apple Access II (030-0923-A, copyright 1983), Appendix i, pp 165-166.

4 - The mapping for an Apple IIe or IIC running Access II to IBM 3278 Keys is as follows (not checked):

3278 Key	Press
-----	-----
PF1	Esc 1
PF2	Esc 2
PF3	Esc 3
PF4	Esc 4
PF5	Esc 5
PF6	Esc 6
PF7	Esc 7
PF8	Esc 8
PF9	Esc 9
PF10	Esc 0
PF11	Esc - (minus)
PF12	Esc =

PF13	Esc !
PF14	Esc @
PF15	Esc #
PF16	Esc \$
PF17	Esc %
PF18	Esc ^
PF19	Esc &
PF20	Esc *

LaserWriter: Recommended Transparency Film

=====

This article last reviewed: 5 November 1987

To make transparencies in a LaserWriter, use 3M's

Scotch 501 (15902-2) Transparency Film for Plain Paper Copiers

It's thick enough to take the heat from the fuser while giving a reasonably dense image. Anything thinner than 501 film could melt within the LaserWriter fuser assembly.

Daisy Wheel Printer: Configuring it for all Apples (10/94)

Article Created: 04 December 1984
Article Reviewed/Updated: 13 October 1994

TOPIC -----

What are the configuration settings for the Apple Daisy Wheel Printer for all Apple systems?

DISCUSSION -----

Below are the switch settings for configuring a Daisy Wheel Printer to any Apple computer. (NOTE: To get at the switches in the rear of the printer, you must use a screwdriver to remove the top cover.)

System	Rear Panel Switches		Front	
	SW-1	SW-2	Switches	Cable Required
	12345678	12345678	12345678	(see key below)
Apple III	11100111	00001001	10000100	A+B
Macintosh	N/A	N/A	N/A	N/A
Lisa	11100111	00001001	10000100	A+B
Apple IIc	11100111	00001001	10000100	C*
Super Serial	11100111	00001001	10000100	B
High Speed Serial	00100111	00001001	10000100	B

Switch Setting Key: 0 = off = open; 1 = on = closed

Cable Key:

Letter	Part number	Comments
--------	-------------	----------

A	590-0029-00	Modem Eliminator
B	590-0037-B	DB-25 Pin to pin (1-8, 12, 13, 19, 20)
C	590-0191-A	5-pin DIN to DB-25

The pinouts for these cables are contained in separate articles in

AppleLink's Technical Information Library.

* - Using default port settings

Apple III Driver, data configuration block:

```
-----  
      0  1  2  3  4  5  6  7  8  9  A  B  
RS-232  0E 00 10 10 10 00 13 11 DF 84 50 80  
Printer 0E 00 10 10 10
```

Super Serial Card Configuration:

```
      1  2  3  4  5  6  7  
SW1  Off Off Off On  Off On  On  
SW2  On  On  Off Off On  Off Off
```

Jumper block should be pointing towards terminal.

Macintosh System Software Version 5.0: Changes

Revised: 5/10/89
Security: Everyone

Macintosh System Software Version 5.0: Changes

=====

This article last reviewed: 05 November 1987

On the System Tools disks, Version 5.0, a number of files are changed compared to those on previous versions of Macintosh system software, and several new files have been added. Here is a list of some of the changes.

LaserWriter 5.0

- Laser Prep 5.0 works only with LaserWriter 5.0.
- The FOND resource was changed to work properly with right and full justification.
- The LaserWriter driver now writes the document name to the LaserWriter resource file.
- Bitmap clipping is changed: MacPaint documents now print without being clipped on the right side.
- The FKEY Command-Shift-4 is disabled when the user has selected more than two bits per pixel.
- StyleExtra is not used to determine whether to do line layout.
- LaserPrep sets timeout at 300 seconds instead of 30 seconds.

Changes Made to System 4.2

- Patched the new Font Manager on the Macintosh Plus.
- The Palette Manager is implemented.
- InitGraf within the Palette Manager is changed so that more than the default device is recognized.

..TIL01045-Macintosh_System_Software_Version_5-0-Changes.pdf

- In the ADB driver, the mouse button debounce time is increased to 20 milliseconds.
- The ADB driver will always notice a mouse down event. Mouse down followed by mouse up will not be discarded.
- The Sound Manager installs its VBL queue request as the last one in the VBL queue, so that other VBL requests will be serviced first and the Sound Manager will not interfere with them.
- Each INIT in the system heap is now guaranteed no less than 16K of memory.
- Disabled menu items no longer "float" among the menu choices.
- Hierarchical menu and scrolling arrows do not resize if the menu font size changes.
- The Script Manager is now initialized before an application launch, it doesn't use a series of spaces with a carriage return as one word, and non-breaking spaces don't terminate words.
- A problem that sometimes occurred when switch-launching between floppy disks on a Macintosh II with multiple monitors has been fixed.
- QuickDraw has speeded up PixMap copying by calling the color mapping CopyBits code only when the color table seed of the source PixMap differs from that of the destination PixMap.

Monitors (cdev)

- Calls ActivatePallette whenever the screen bit depth changes.

Apple IIGS: Characters Print Larger Than Specified Point Size

Revised: 5/25/89
Security: Everyone

Apple IIGS: Characters Print Larger Than Specified Point Size

=====

This article last reviewed: 11 December 1987

The Apple IIGS screen can display 320 by 200, or 640 by 200 pixels. The Apple IIGS print driver's default is to match the vertical resolution of the screen. This does not give you a true point size -- a "point" being 1/72 inch -- as the Macintosh does. The Apple IIGS print driver's default is to print in screen pixels, not in points. This causes the characters to print larger than the Macintosh characters of the same font and size.

If You Choose 'Condensed' in the Page Setup dialog, the print driver will print in points instead of screen pixels. The printed characters will approximate the size of the equivalent Macintosh characters.

LocalTalk PC Card: AST Rampage and NeStar Compatibility

Revised: 11/2/88
Security: Everyone

LocalTalk PC Card: AST Rampage and NeStar Compatibility

=====

This article last reviewed: 11 January 1988

Apple Technical Communications is not aware of any problems when using an AST Rampage card or a NeStar net card with a LocalTalk PC card.

However, there are some potential conflicts:

- DRQ, IRQ, and address settings may overlap.
- It's possible that one or both of the mentioned cards will use the same bus lines as the LocalTalk Card.

Parameters on the LocalTalk Card can be reconfigured to include the other card's address range. Instructions for reconfiguring the AppleTalk PC card are in the LocalTalk PC Card manual. Such changes become necessary when the same signal lines are used on two PC boards. There being a small number of data and communication lines available, it is possible for lines to overlap. We suggest you check the documentation of each board with that of the LocalTalk PC Card, and configure one or both as described within the appropriate manual.

HyperCard: Problems with Older Versions of TOPS

=====

Article Created: 05 November 1987
Article Last Reviewed: 1 June 1992
Article Last Updated:

Reports from the field indicate there have been problems with HyperCard not functioning properly with older versions of TOPS that came with System 3.2.

The problem is related to how TOPS is installed. When the TOPS installer is run, it copies resources (INIT 31 and AppleTalk) from System 3.2 and replaces those resources in the System file of the destination volume. This causes major problems on a Macintosh using System 4.0 or 4.1.

The workaround:

1. Copy the contents of the TOPS disk to a double-sided disk. TOPS comes on a single-sided disk, and System 4.0 or later will not fit on a single-sided disk with the TOPS installer.
2. Use the System Installer to update the new disk to the version of the System and Finder your destination volume is running.
3. Install TOPS.

Because of continuing cost reductions on 16K RAMs, current revisions of the Apple II accept only 16K RAMs.

Page 7

Table 2, the backspace key are reversed.

->	\$95	\$95	\$95	\$95
<-	\$88	\$88	\$88	\$88

Page 9

2nd Paragraph, the pins carrying the video signals are referred to as being on the left side of the board. They are on the RIGHT.

Page 10

The photograph refers to a Revision 6 Apple. Revision 7 and later Apples will look slightly different.

Page 10

The Eurapple modification is not complete and we do not support or recommend modification of Apples for European television signals.

Page 11

The photograph refers to a Revision 6 Apple. Revision 7 and later Apples will look slightly different.

Page 23

The photograph refers to a Revision 6 Apple. Revision 7 and later Apples will look slightly different.

Page 25

First paragraph, line 4; The address is actually \$C040 instead of \$C04F.

Page 31

Paragraph 3, line 3, "the leftmost column" should read "the rightmost

column"

Page 31

Table 11 should read:

LEFT EDGE	32	\$20	0/ 0/39	\$0/\$ 0/\$27
WIDTH	33	\$21	0/39/39	\$0/\$27/\$27
TOP EDGE	34	\$22	0/ 0/23	\$0/\$ 0/\$17
BOTTOM EDGE	35	\$23	0/24/24	\$0/\$18/\$18

Page 35

ESC E "When COUT detects this" should read "When RDKEY detects this"

Page 36

The Autostart ROM initializes the annunciators 0 and 1 to OFF and annunciators 2 and 3 to ON.

Page 37

Paragraph 5 refers to to using call -1169 to set \$3F4 to XOR of \$3F3 in autostart reset vector. This may garbage the diskette in drive 1 if used on a non-autostart system.

-) and the forward copy key (-

Page 47

The line of monitor command just under the first paragraph should read

```
*0:FF FF AD 30 C0 88 D0 04 C6 01 F0 08
*:CA D0 F6 A6 00 4C 02 00 60
```

Page 70

Paragraph 2, the page 3 memory usage chart is actually on page 65 of the manual instead of page 62.

Page 70

RAM Configuration Blocks are not included on Revision 7 and later Apple boards.

Page 74

The Zero Page memory maps are incomplete. Applesoft also uses \$D6 and Applesoft HIGH-RES uses \$19 to \$1D.

Page 79 Table 22

The line for \$C060 should be

	\$0	\$1	\$2	\$3	\$4	\$5	\$6	\$7
\$C060	cin	pb0	pb1	pb2	gc0	gc1	gc2	gc3

Page 81

Paragraph 3 recommends IOSAVE and IORESTORE. These routines must be used with caution because if any other routine in the system uses them, they will overwrite your information. The 6502 stack is a better place to save the registers.

Page 84

Expansion ROM, paragraph 3, This flip-flop should be turned on by the I/O SELECT signal, not the DEV SEL signal.

Page 89

The photograph refers to a Revision 6 Apple. Revision 7 and later Apples will look slightly different.

Page 89

The pointer to the USER 1 jumper is wrong. See the photograph on page 99 for the correct location.

Page 90 Paragraph 5

RDY, RES, IRQ, NMI lines are held high by a 1000 ohm resistor, NOT 3300 ohm.

Page 91

Data from 6502 (read) and Data to 6502 (write) are reversed.
They should be:

Data from 6502 (write)
Data to 6502 (read)

Page 96

Paragraph 4, line 5, the 74LS283 is at location E14.

Page 100

The Apple's new built-in keyboard is built around a AY-5-3600 keyboard encoder. The inputs to this ROM, pins 17 through 26 and 36 through 40, are connected to the matrix of keyswitches on the keyboard. The outputs of this ROM are buffered by a 74LS04 and are connected to the Apple keyboard connector.

The keyboard decoder rapidly scans through the array of keys on the keyboard, looking for one that has been pressed. This scanning action is controlled by the free running oscillator made up of three sections of a 74LS00 at location B3 on the separate encoder board. The speed of this oscillation is controlled by C7, R7 and R8 on the encoder board.

Apple II Hardware: Errata in Apple II Reference Manual (2 of 2)

Revised: 10/29/84
Security: Everyone

Apple II Hardware: Errata in Apple II Reference Manual (2 of 2)

=====

Page 104

The +12 and -5 volt levels are documented on page 92 as +11.8 and -5.2. The levels will vary from Apple to Apple.

Page 107

Pin 19, SYNC, is connected only on Apples manufactured for sales overseas.

Page 107

Pin 21, RDY, is pulled high with a 1000 ohm resistor to +5 volts.

Page 107

Pin 22, DMA, is held high by a 1000 ohm resistor to +5 volts. This signal will stop the 6502 clock. It should not be held low for more than two clock cycles or the 6502 internal registers may be lost.

Page 108

Pin 28, INT IN, is the second item on the page and is mislabeled 26.

Page 108

Pin 32, INH, is pulled high by a 1000 ohm resistor.

Page 108

Pin 35, COLOR REF, is connected only on Apples manufactured for sales overseas.

Page 119

Figure 3 should be labeled:

ROTATE ONE BIT RIGHT (MEMORY OR ACCUMULATOR) M or A.

Page 120

The Processor status word should be

7							0
+---+---+---+---+---+---+---+							
N	V		B	D	I	Z C	
PROCESSOR STATUS WORD, "P"							

+---+---+---+---+---+---+---+---+

^

This bit is undefined.

Page 121

Note 1 should read "Bits 6 and 7 are transferred to the Status Register. If the result of A AND M is zero, then Z=1; otherwise Z=0."

Page 127-128

The unimplemented opcodes are shown as NOPs, which is wrong. \$EA is the only code defined as NOP. The others should not be used as they perform undefined operations.

Page 128

Op-code \$AD is a LDA, Absolute

Page 137

The addresses starting at line 100 should be:

```
CLRAN0 EQU $C058
SETAN0 EQU $C059
CLRAN1 EQU $C05A
SETAN1 EQU $C05B
CLRAN2 EQU $C05C
SETAN2 EQU $C05D
CLRAN3 EQU $C05E
SETAN3 EQU $C05F
```

Page 143

Starting at address \$FA6F the comments should read:

```
FA6F LDA CLRAN0 ;AN0 = TTL LO
FA72 LDA CLRAN1 ;AN1 = TTL LO
FA75 LDA SETAN2 ;AN2 = TTL HI
FA78 LDA SETAN3 ;AN3 = TTL HI
```

Page 165

The comment after address \$FCAC should read

```
1.0204 USEC * (13+27/2*A+5/2*A*A)
```

Pages 172-176

These tables were cut up to fit the pages so they are no longer in numeric or alphabetic order.

Scribe Printer: Apple IIC Manual Errata (030-0993-A) (2 of 3)

Revised: 10/17/94
Security: Everyone

Scribe Printer: Apple IIC Manual Errata (030-0993-A) (2 of 3)

=====

On page 24,

1. change DIPSW (00*00000), '1=ON, 0=OFF'
to DIPSW (00000*00), '1=ON, 0=OFF'
2. change the last paragraph to read as follows:

Inside the "DIPSW()" message is the present setting of DIP switches SW1-SW8 at the back of the printer. The printout numbers, reading from left to right, correspond to the setting of the DIP switches SW1-SW8, respectively. If the message shows "DIPSW(00000*00)", the switch settings are normal and correct. If not, refer to "DIP switch SW1-SW8 Functions" in Chapter 2, Text and General Control Codes of Part II of this manual.

3. The statements in the lower left-hand margin should read as follows:

During self-test, the * is printed out for switch 6 regardless of the switch's setting. Switches 5 and 6 are used for setting print density and are normally set to the OFF (UP) position.

The relation of the printout number to the switch positions is as follows:

```
(000000*00)
|           |
SW1.....SW8
```

On page 32, change DIPSW (00*00000)
to DIPSW (00000*00)

On page 53, change the last paragraph to read:

You can run the Scribe Printer self-test to obtain a printout of the switch positions. A self-test DIP switch setting printout of (00000*00) is the normal indication. The printout, reading from left to right, corresponds to the settings of SW1-SW8, respectively. Switch SW6 indicates an * regardless of its setting.

On pages 31, 93 and 121,

change "1-ampere fuse"
to "2-ampere fuse for 110-volt systems and 1-ampere fuse for 220-volt
systems."

On page 12, add the following to the right of step #1:

If you haven't already done so, remove the black plastic coil (print head
shipping retainer) from the inside of the printer.

Pages 59 and 60 are incorrect in some manuals. Those pages should look like
this:

Page 59:

Character Repetition:

You can send a single control code to the Scribe that will cause it to
print the same character up to 80 times at a 10 character per inch pitch
and 136 times at a pitch of 17 characters per inch.

Code:	Decimal:	Hex:	Effect:
ESC R nnn c	27 82 ddd d	\$1B \$52 hhh h	Prints nnn repetitions of character c.

(where nnn is the numer of repetitions, c is the character, d is the
decimal number assigned to each ASCII digit n, or character c in this
case, and each h is the Hex equivalent of each d.)

For example, the following control code will cause 24 asterisks to be
printed one after another:

ASCII Code:	Decimal:	Hex:
ESC R 024 *	27 82 48 50 52 42	\$1B \$52 \$30 \$32 \$34 \$2A

The number nnn in this control code must always be three digits long;
however, leading zeros may be replaced by spaces.

By the way: If the number nnn is so large that the repeated characters
run beyond the end of the line, the auto-print action must be set to
produce a line feed; otherwise, the excess characters will print over
other characters on the same line. (See Auto-Print Action, described
later in this chapter.)

Alternate (National) Characters:

Your Scribe has seven different language fonts to aid in printing your
text in German, French, Italian, Swedish, Spanish, and British English,
as well as American English. You can choose any one of these character

groups to substitute for these ten American symbols:

* @ [\] ` { | } ~

Table 2-3 illustrates the characters in each alternate language font. The Draft Mode characters are shown; Letter Mode characters are the same, except for style. (See Appendix D.)

Scribe Printer: Apple IIC Manual Errata (030-0993-A) (3 of 3)

=====

Page 60:

Table 2-3 Alternate (National) Language Characters, Draft Mode

Language

American	#	@	[\]	`	{		}	~
British	Lbs.	@	[\]	`	{		}	~
German	#	sect.	A-um.	O-um.	U-um.	`	a-um.	o-um.	u-um.	Essatz
French	Lbs.	a-ag.	o.	c-c.	sect.	`	e-aa.	u-ag.	e-ag.	um.
Swedish	#	@	A-um.	O-um.	A-o.	`	a-um.	o-um.	a-o.	~
Italian	Lbs.	sect.	o.	c-c.	e-aa.	u-ag.	a-ag.	o-ag.	e-ag.	i-ag.
Spanish	Lbs.	sect.	!-inv.	N-~	?-inv.	`	o.	n-~	c-c.	~
	\$23	\$40	\$5B	\$5C	\$5D	\$60	\$7B	\$7C	\$7D	\$7E

KEY:

aa. = accent aigu (goes above letter)
ag. = accent grave (goes above letter)
c. = cedilla (goes below letter)
Essatz = German double-s elision
o. = diacritical small o (goes above letter)
Lbs. = pounds sterling
sect. = section sign
um. = umlaut (goes above letter)
~ = tilde (goes above letter)
?-inv. = Inverted question mark
!-inv. = Inverted exclamation point

In this table, the top line shows the American characters. The other lines give the alternate character groups that can be substituted for these characters by using the appropriate control codes. DIP switches SW1, SW2 and SW3 specify the selected character group.

Note: The "\$" (Hex 24) and "^" (Hex 5E) are part of the standard font in all languages. For the Spanish hyphen, use the single-quote key "'" (hex

27), which is also the same for all languages.

Table 2-4 shows the control codes and combinations of positions of the three DIP switches to select the desired alternate character group. Note that there are two different sets of DIP switch settings and two different control codes that produce American symbols; you can use either one, since the effects of both are the same.

Table 2-4. Alternate (National) Character Set Codes

Language		DIP Switches		
Font	Code	SW1	SW2	SW3
American	ESC Z CTL-G CTL-@	Off (Up)	Off (Up)	Off (Up)
German	ESC Z CTL-C CTL-@ ESC D CTL-D CTL-@	Off (Up)	Off (Up)	On (Down)
American	ESC Z CTL-E CTL-@ ESC D CTL-B CTL-@	Off (Up)	On (Down)	Off (Up)
French	ESC Z CTL-A CTL-@ ESC D CTL-F CTL-@	Off (Up)	On (Down)	On (Down)
Italian	ESC Z CTL-F CTL-@ ESC D CTL-A CTL-@	On (Down)	Off (Up)	Off (Up)

Lisa: Converting Workshop files to LisaWrite documents (10/94)

=====

Article Created: 30 January 1985
Article Reviewed/Updated: 17 October 1994

TOPIC -----

This article describes the conversion process for Lisa Workshop documents into LisaWrite.

DISCUSSION -----

Workshop ASCII files can be converted to LisaWrite documents. Once they are in LisaWrite format, the information they contain can be transferred to other applications, such as LisaCalc, using Cut and Paste. Convert Workshop files with the following procedure.

From the Workshop:

1. Initialize a diskette.
2. Copy the Workshop files to the diskette.
3. Rename the Workshop files with LisaWrite Office System names: e.g., {D200T1}, {D201T1}, {D202T1}, ...{D<200+N>T1}.

From the Office System:

4. Insert the diskette and repair it. This procedure forms a new catalog with containing all files on the diskette.
5. When you open the diskette, each of the documents appear with names such as "Document 200", "Document 201", and so on.
6. Open each of the documents; they should contain the text from the Workshop files.
7. Make a minor change (e.g., add, then delete a space) to force LisaWrite

to rewrite the document, then Save and Put Away.

LisaWrite: Converting 7/7 Documents For Use w/ Lisa 2.0 (10/94)

=====

Article Created: 30 January 1985
Article Reviewed/Updated: 17 October 1994

TOPIC -----

Those who wish to continue working with the Office System 2.0 software may be able to convert Lisa 7/7 LisaWrite documents to 2.0 if they need to. This article tells how.

DISCUSSION -----

PREREQUISITES:

The document must not contain:

- A. Any graphics (pasted from LisaGraph, LisaDraw, etc.).
- B. Eight or fourteen point text (including spaces, etc.).

PROCEDURE:

1. Save the documents you wish to convert to a diskette formatted for Lisa 2.0.
2. In the Workshop (version 3.0), run the DumpPatch program (refer to the Workshop manual for details) and change the second word of each document from 0005 to 0004.
3. Open the document from the 2.0 Office System, make a minor change (to force the application to rewrite the document), then select Save and Put Away.

The document should now be in Lisa 2.0 format, though we don't guarantee that this procedure will always work.

Applesoft: Syntax errors after CTRL-S (10/94)

=====

Article Created: 30 January 1985
Article Reviewed/Updated: 17 October 1994

TOPIC -----

Sometimes, when I use the control-S feature to examine a Basic program listing, I get a SYNTAX ERROR after typing the next line. What causes this?

DISCUSSION -----

This happens because you accidentally typed an extra control-S after the program was through listing. This extra control-S is put into the input buffer like any other characters and, since no Basic command starts with a control-S, you get a SYNTAX ERROR.

Typing the left-arrow key until the Apple generates a new prompt line will insure that there is no control-S in the buffer. Alternatively, try to be more careful while typing control characters: holding down the key just a little too long WILL eventually cause more than one character to be generated.

LisaTerminal 7/7: NULl character at begining of each pasted line

=====

LisaTerminal sends an ASCII 0 (NULl) character at the beginning of each pasted line. This does not occur when entering text from the keyboard.

The addition of the NULl character helps LisaTerminal compensate for wordwrapping, eliminating the need to have a return at the end of each line of text.

Lisa 7/7 Software: Unable to Use a Tool That Has a Password

=====

Even though your Lisa Office System manual states (page 257) that you can protect your tools (applications) with passwords -- don't do it! If you protect a tool that hasn't been used since you powered up, when you attempt to use it, you will get a message that the tool is damaged or is having technical difficulties. You must remove the password before proceeding. LisaWrite and LisaList are exceptions: they seem to function regardless of whether you entered a password.

LisaList: Error Too Many Time Components

=====

Typing (or pasting) a time, such as 1:15 pm, into a cell may result in the error message: "Too many time components. Format is..." when your Data Format includes an am/pm (e.g., hh:0m am). The am and pm acts as if they need 4 spaces instead of 2. With a Data Format of hh:0m am, you may enter up to 4 numbers for the hours and minutes, but ONLY up to 2 characters if you include an am or pm. For example:

Your Type	LisaList Displays
555	5:55 pm
1155	11:55 am
13pm	1:00 pm
110pm	not acceptable: you have a total of 6 spaces available of which the pm needs 4.

When your Data Format is hh:0m:0s am you may enter up to 6 numbers, 4 if you enter the am/pm.

Remember, if the Data Format includes an am/pm and you don't specify which, LisaList interpretes the time as:

0	Midnight
1-6	pm
7-11	am
12	Noon
13-23	pm

Refer to your LisaList 7/7 manual, page 144.

N = 2**BitsPerSample (for Red samples) +
 2**BitsPerSample (for Green samples) +
 2**BitsPerSample (for Blue samples)

This tag defines three color response curves (one each for Red, Green, and Blue color information). The curves are stored sequentially (in red-green-blue order). The size of each table is 2**BitsPerSample, using the BitsPerSample value corresponding to the respective color. The ColorResponseUnit further specifies how each entry in the table is to be interpreted.

The purpose of the color response curves is to act as a "lookup" table mapping values from 0 to 2**BitsPerSample-1 into specific intensity values. The intensity values are as specified by the NTSC color standard assuming illumination to be CIE D6500.

Correspondence to the Physical World

XResolution

Tag = 282 (11A)

Type = RATIONAL

N = 1

The number of pixels per ResolutionUnit (see below) in the X direction, i.e., in the ImageWidth direction. It is, of course, not mandatory that the image be actually printed at the size implied by this parameter. It is up to the application to use this information as it wishes.

As is the case for many of these fields, XResolution may be invalid and irrelevant for some images (e.g., images made with a hand-held digitizing camera, which has a three-dimensional nature) and should therefore be absent from the image file.

No default.

YResolution

Tag = 283 (11B)

Type = RATIONAL

N = 1

The number of pixels per ResolutionUnit in the Y direction, i.e., in the ImageLength direction.

No default.

ResolutionUnit

Tag = 296 (128)

Type = SHORT

N = 1

To be used with XResolution and YResolution.

1 = no absolute unit of measurement. Used for images that may have a non-square aspect ratio, but no meaningful absolute dimensions.

2 = inch

3 = centimeter

Default is 2

Orientation

Tag = 274 (112)

Type = SHORT

N = 1

1 = The 0th row represents the visual top of the image, and the 0th column represents the visual left hand side.

2 = The 0th row represents the visual top of the image, and the 0th column represents the visual right hand side.

3 = The 0th row represents the visual bottom of the image, and the 0th

column represents the visual right hand side.

4 = The 0th row represents the visual bottom of the image, and the 0th column represents the visual left hand side.

5 = The 0th row represents the visual left hand side of the image, and the 0th column represents the visual top.

6 = The 0th row represents the visual right hand side of the image, and the 0th column represents the visual top.

7 = The 0th row represents the visual right hand side of the image, and the 0th column represents the visual bottom.

8 = The 0th row represents the visual left hand side of the image, and the 0th column represents the visual bottom.

Default is 1.

Document Context

DocumentName

Tag = 269 (10D)

Type = ASCII

The name of the document from which this image was scanned.

No default.

PageName

Tag = 285 (11D)

Type = ASCII

The name of the page from which this image was scanned.

No default.

XPosition

Tag = 286 (11E)

Type = RATIONAL

The X offset of the left side of the image, with respect to the left side of the page, in inches.

No default.

YPosition

Tag = 287 (11F)

Type = RATIONAL

The Y offset of the top of the image, with respect to the top of the page, in inches. In the TIFF coordinate scheme, the positive Y direction is down, so that YPosition is always positive.

No default.

PageNumber

Tag = 297 (129)

Type = SHORT
N = 2

This tag is used to specify page numbers of a multiple page (e.g. facsimile) document. Two SHORT values are specified. The first value is the page number; the second value is the total number of pages in the document.

Note that pages need not appear in numerical order.

Miscellaneous Strings

ImageDescription
Tag = 270 (10E)
Type = ASCII

Useful or interesting information about the image.
No default.

Make
Tag = 271 (10F)
Type = ASCII

The name of the scanner manufacturer.
No default.

Model
Tag = 272 (110)
Type = ASCII

The model name/number of the scanner.
No default.

Storage Management

These fields may be useful in certain dynamic editing situations. Software that merely reads TIFF files will probably not need to care about these fields. And, of course, software that creates TIFF files is by no means required to write these fields.

FreeOffsets
Tag = 288 (120)
Type = LONG

For each "free block" in the file, its byte offset.
No default.

FreeByteCounts
Tag = 289 (121)

Type = LONG

For each "free block" in the file, the number of bytes in the block.

Configuring the ImageWriter to an Apple III or III+ (10/94)

=====

Article Created: 26 September 1984
Article Reviewed/Updated: 17 October 1994

TOPIC -----

The following information shows how to configure an Apple /// and an ImageWriter II printer.

DISCUSSION -----

Interface:

You may use either the .PRINTER driver or the .RS232 driver. The appropriate data configuration blocks for these drivers are:

```
.PRINTER:  [0E] [00] [00] [00] [00]
.RS232:    [0E] [00] [00] [00] [00] [00] [13] [11] [DF] [84] [50] [80]
```

Cables:

Modem Eliminator Cable (Part #590-0166)
Serial and Communications Cable (Part #590-0037)

Printer Switch Settings:

```
      8 7 6 5 4 3 2 1
SW1: | | |X| | | | |
      |X|X| |X|X|X|X|X|
```

```
      4 3 2 1
SW2: | | |X|X|
      |X|X| | |
```

NOTE: These switch settings are for the U.S. character set, 66-line page length, 8 data bits, elite pitch, no auto-LF after CR,

9600 baud, DTR data protocol. If you wish to change any of these settings, you must make corresponding changes in the data configuration block for whatever printer driver you're using.

Search on "Imagewriter and switches" and/or "driver data configuration" for more information on configuring.

ImageWriter: Configuring For a Macintosh (10/94)

Article Created: 04 January 1985
Article Reviewed/Updated: 17 October 1994

TOPIC -----

The following information shows how to configure a Macintosh and an ImageWriter printer.

DISCUSSION -----

Printer Switch Settings:

	8	7	6	5	4	3	2	1	
SW 1:			X						CLOSED
	X X	X X X X X							OPEN

	4	3	2	1	
SW2:			X X		CLOSED
	X X				OPEN

Cable: Serial Interface Cable (Part # 590-0169)

NOTE:

The first 3,000 Macintosh Imagewriter cables manufactured lacked pins 7 and 20; these cables cannot support hardware handshaking (DTR). To use these cables, change switch 3 of SW2 to closed) so that the printer can use software handshaking (XOn/XOff). (You need change nothing on your Macintosh, since the Imagewriter driver in your Macintosh software supports either protocol.)

One company, Microsoft, uses their own printer drivers; these drivers support only DTR, and so it's not possible to print from Microsoft programs using one of the old cable.

Macintosh: Insufficient Room to Copy a Document (10/94)

=====

Article Created: 11 March 1985
Article Reviewed/Updated: 17 October 1994

TOPIC -----

When I try to copy a document to another floppy disk or hard disk, sometimes a dialog box appears: "There is insufficient room to copy your document" appears. What does this mean?

DISCUSSION -----

There may not be enough temporary work space for your Macintosh to comply with your request. Although there may appear to be plenty of room on the disk, you must free up space on the source disk until your Macintosh can complete the task.

Lisa 7/7 and MacWorks: A 5-MB ProFile Can Be Inadequate for Both

=====

The first time an application is opened during a session, Lisa sets up a process for both that application and all documents created by that application. The first time you print from an application, another process is opened. Because each process uses 200 blocks, using all seven applications requires 1,400 blocks of disk space. Printing requires up to another 1,400 blocks.

A five-megabyte ProFile containing both the Lisa 7/7 Office System and MacWorks can easily become taxed for storage space. The Office System alone takes up about 6,000 blocks (3 megabytes) and Macintosh software takes up another 2,000 blocks (1 megabyte), leaving less than 2,000 blocks for storing documents and all associated processes. In short, users who wish to run both 7/7 software and MacWorks from the same disk should do so from a 10-megabyte ProFile.

Lisa 7/7: Installing OS 3.1 and Macintosh software on hard disk

=====

To install ONLY Office System 3.1 to share or not share the hard disk with Macintosh software:

1. Backup any Office System or Macintosh documents from the hard disk.
2. Follow the procedures in Chapter 6 or the Lisa Office System manual to install the Lisa 7/7 Office System 3.1.
 - a. When prompted to Erase or Don't Erase, select Erase.
 - b. When prompted to Share or Don't Share:
 1. Select Share if you want to store Macintosh software on the hard disk.
 2. Select Don't Share if you use your hard disk to store only Office System software.

LisaCalc 7/7: Regression--explanations and clarifications

=====

Some confusion has arisen regarding the F-test formula, a type of Regression value. To begin with, the formula as listed in the LisaCalc manual on 167 is incorrect; it should be $F = (r / (k - 1)) / ((1 - r) / (n - k))$.

Another cause of confusion about this formula seems to arise from the fact that the result that the function returns is the coefficient of determination, also known as the "r-square value"; the r in the formula, then, is already the r-square value as returned by the regression function. It does not need to be squared in the formula.

Two more corrections to the Regression section in the LisaCalc 7/7 manual:

1. Page 154: The formula at the bottom of the page should read:
Correlation (B3:E7, H6:19).
2. On page 165, under Type of Regression Values: The fourth sentence incorrectly states that the correlation coefficients are sorted from the highest to the lowest index. In fact, they are listed in the order they appear in the data matrix.

Applesoft: 8 Bit Output (1 of 2)

Revised: 3/11/85
Security: Everyone

Applesoft: 8 Bit Output (1 of 2)

=====

For a number of reasons, AppleSoft "sets the eighth bit" of any data that it prints out--that is, it adds 128 to each ASCII value sent to the output device. A statement like

```
10 PRINT CHR$(76),
```

for example, doesn't really send ASCII 76 to the device; rather, it sends ASCII 204, or 76 + 128. This situation doesn't normally cause any problems--unless you're sending data to (1) a printer in "graphics" mode, (2) a printer in "custom character" mode, (3) any device that only uses ASCII values in the range of 0 to 255, (4) any device that expects byte-oriented data, or (5) any device that always needs the eighth bit clear, such as Hewlett-Packard devices. If the device you're sending Applesoft data to is one that needs the eighth bit clear, you will see one or more of the following symptoms:

1. The device refuses to respond to commands;
2. The device refuses to print graphic characters;
3. In graphics mode, an extra dot or line appears periodically throughout the printout.

The following short machine language program allows you to have complete control over the eighth bit in output statements sent from Applesoft; this program works under either DOS 3.3 or ProDOS.

To run the program, first boot from a DOS 3.3 or ProDOS disk, and then type the following commands, following each with a carriage return.

NOTE: The indented material in CAPITAL letters below is what you should type (without the leading spaces, of course); the material in lowercase letters consists of instructions and general information.

From Applesoft BASIC, type:

```
CALL-151
```

The system will respond with an * prompt. After the *, type:

300:A9 4C 8D F5 03 A9 10 8D

Press RETURN; you'll then get a another * prompt. Repeat this process with each of the following lines:

308:F6 03 A9 03 8D F7 03 60

310:20 6D 03 20 E3 DF A0 00

318:B1 83 F0 2E AA C8 B1 83

320:85 5E C8 B1 83 85 5F A0

328:00 B1 5E 20 ED FD C8 CA

330:D0 F7 A0 00 B1 B8 C9 3A

338:F0 10 C9 00 F0 0C C9 3B

340:F0 11 20 7D E0 90 07 4C

348:10 03 20 8E FD 60 A2 10

350:4C 12 D4 20 59 03 4C 60

358:03 E6 B8 D0 02 E6 B9 60

360:B1 B8 C9 3A F0 E7 C9 00

368:F0 E3 4C 10 03 A0 00 B1

370:B8 D9 9F 03 D0 28 C8 C0

378:02 D0 F4 68 68 20 86 03

380:20 ED FD 4C 32 03 A9 02

388:18 65 B8 85 B8 A9 00 65

390:B9 85 B9 20 67 DD 20 FB

398:E6 A5 A1 20 59 03 60 E7

3A0:28

Now, to check your work, type:

300.3A0

What you have typed up to this point will then be listed; it should look like the listing below. If any lines contain mistakes, simply retype the bad line and then repeat the last step (300.3A0). Repeat this process until your listing

exactly matches the one below.

```
300 - A9 4C 8D F5 03 A9 10 8D
308 - F6 03 A9 03 8D F7 03 60
310 - 20 6D 03 20 E3 DF A0 00
318 - B1 83 F0 2E AA C8 B1 83
320 - 85 5E C8 B1 83 85 5F A0
328 - 00 B1 5E 20 ED FD C8 CA
330 - D0 F7 A0 00 B1 B8 C9 3A
338 - F0 10 C9 00 F0 0C C9 3B
340 - F0 11 20 7D E0 90 07 4C
348 - 10 03 20 8E FD 60 A2 10
350 - 4C 12 D4 20 59 03 4C 60
358 - 03 E6 B8 D0 02 E6 B9 60
360 - B1 B8 C9 3A F0 E7 C9 00
368 - F0 E3 4C 10 03 A0 00 B1
370 - B8 D9 9F 03 D0 28 C8 C0
378 - 02 D0 F4 68 68 20 86 03
380 - 20 ED FD 4C 32 03 A9 02
388 - 18 65 B8 85 B8 A9 00 65
390 - B9 85 B9 20 67 DD 20 FB
398 - E6 A5 A1 20 59 03 60 E7
3A0 - 28
```

When your listing contains no errors, type:

```
BSAVE ASOFT8BIT,A$300,L$A1
```

The program is now available for your use. To use it inside your BASIC program, simply include a line like:

```
10 PRINT CHR$(4);"BRUN ASOFT8BIT"
```

in your own program.

Applesoft: 8 Bit Output (2 of 2)

Revised: 3/11/85
Security: Everyone

Applesoft: 8 Bit Output (2 of 2)

=====

Here are some examples of valid statements that use this routine (<CR> means carriage return):

COMMAND	RESULT
10 & CHR\$(0)	sends an ASCII 0 followed by <CR>
10 & CHR\$(0);	sends an ASCII 0 with no <CR>
10 A\$=CHR\$(0)+CHR\$(1)+CHR\$(2) 20 & A\$	sends an ASCII 0 then 1 then 2 then <CR>
10 X=1:Y=2:A\$(X)="SOME GARBAGE" 15 A\$(Y)="MORE" 20 & A\$(X);A\$(Y);	sends strings SOME GARBAGE & MORE

The following statements are invalid and will result in a SYNTAX ERROR.

INVALID COMMAND	REASON FOR SYNTAX ERROR
10 & A\$,B\$	No comma allowed
10 & X	"&" doesn't work with numeric variables. Use (10 A\$=STR\$(X):& A\$) instead.

NOTE: This program is useful mainly for sending output to a printer or similar peripheral device that has been initialized in the normal manner--that is, with PR#(slot #). You can send the output to the screen if you wish, but characters will either flash on and off or appear in inverse video.

LaserWriter: Diablo 630 Emulation Mode (10/94)

Revised: 10/17/94
Security: Everyone

LaserWriter: Diablo 630 Emulation Mode (10/94)

Article Created: 11 March 1985
Article Reviewed/Updated: 17 October 1994

TOPIC -----

I have a LaserWriter that I want to use in Diablo 630 emulation mode. How do I set this up, what are some of the issues I will encounter, and what are some of the specifications of Diablo 630 emulation mode?

DISCUSSION -----

To select Diablo 630 emulation mode for the LaserWriter, set the switch on the rear connector panel to Special and use standard RS-232C cabling. You may use either a DB-9 or a DB-25 connector for data input. The data transfer rate is 9600 Baud with Xon/Xoff protocol and no parity: the LaserWriter ignores the parity bit. Once data has stopped arriving, all Diablo printer settings (margins, tabs, spacing, and so on) remain in effect until a printer reset occurs.

It is also possible to switch a LaserWriter to Diablo 630 emulation mode from PostScript. Below is a PostScript routine that puts the LaserWriter in Diablo 630 emulation mode for the remainder of the job (until ^D is received). This is the same Diablo emulation that can be selected with the side-panel switch setting, except for one limitation: when Diablo mode is selected from software, the serial port remains sensitive to the seven control characters ^C^D^T^S^Q and CR,LF. Diablo 630 output uses some of these codes, so the potential for problems is fairly high.

%!
%PostScript code to call Diablo emulator from AppleTalk or serial input stream
% This code should go on the front of a Diablo file.

```
/doDiablo {/printpageflag false def
            {statusdict begin
              62 eescratch fontname
```

```
        61 eescratch dup 0 eq {pop 1} if fontname
        60 eescratch
        59 eescratch
                                /diablo load
    end
    exec
} stopped pop
printpageflag {showpage} if
    } def

/fontname {$idleTimeDict begin
    dup ROMnames length ge {pop 0} if
    ROMnames exch get
    end
    } def

doDiablo
```

In Diablo 630 Emulation mode, the LaserWriter prints a page under two conditions:

- when it reaches the end of a page, or
- when it receives a form feed

The LaserWriter cannot detect the end of a document; it simply assumes that the document has come to an end when data stops arriving.

If the last page of a document isn't full and doesn't end with a form feed, the printer doesn't print it immediately; instead, it waits for a printer timeout, which occurs:

- As soon as the next document arrives, or
- After 30 seconds, if no document arrives before that.

You can avoid this delay by being careful to include a form feed at the end of your document's last page.

The Diablo emulator has some limitations. For instance, the emulator will only print in portrait mode. If you want to print a document in landscape mode, you must use PostScript.

In the LaserWriter and LaserWriter Plus, PostScript can change parameters controlling functions of the Diablo 630 emulation mode. These Persistent Parameters can be found on Page 302-303 of Addison Wesley's Postscript Language Reference Manual (Red Cover). The table on Page 302 gives an index number for each parameter and the default setting at that index. For example, index 62 is the 'normal' font location used in Diablo mode and index 61 is the 'bold' font location. The default value for index 62 is 0 and the default value for index 61 is 1, selecting Courier for the 'normal' font and Courier-Bold for the 'bold' font.

Here is a sample program to change one of these Persistent Parameters:

```
serverdict begin 0 exitserver
```

```
statusdict begin
62 4 setteescratch
```

This program changes the definition of the 'normal' font used in Diablo 630 emulation mode from Courier to Times-Roman by writing the value shown, the second number, into the EEROM. Index 62 is the 'normal' font location and the second number is the font selection number taken from the following table:

0	Courier
1	Courier-Bold
2	Courier-Qblique
3	Courier-BoldQblique
4	Times-Roman
5	Times-Bold
6	Times-Italic
7	Times-BoldItalic
8	Helvetica
9	Helvetica-Bold
10	Helvetica-Qblique
11	Helvetica-BoldQblique
12	Symbol
13	AvanteGarde-Book
14	AvanteGarde-BookOblique
15	AvanteGarde-Demi

Given the limited write capability of any given location in the EEROM (approx. 10,000 writes), this program should be used only to change parameters that need to be changed infrequently. Beware that some fonts don't work in some situations, for example, assigning the Symbol font as the default font.

DIABLO 630 Control Codes

Characters Per Inch:

CPI Code

- 4 Escape, Control-Underscore and Control-Underscore
- 5 Escape, Control-Underscore and Control-Y
- 6 Escape, Control-Underscore and Control-U
- 8 Escape, Control-Underscore and Control-P
- 10 Escape, Control-Underscore and Control-M
(From Apple IIe, Apple IIc, or Apple IIGS using an Apple interface and AppleWorks, use Escape, Control-Underscore and Control-M, Escape, D, Escape, D)
- 12 Escape, Control-Underscore and Control-K
- 15 Escape, Control-Underscore, Control-I,
(From Apple IIe, Apple IIc, or Apple IIGS using an Apple interface and AppleWorks, use Control-I, Control-A, Escape, Control-Underscore, Control-I, Control-A, and Control-I.)
- 20 Escape, Control-Underscore and Control-G
(Note that these letters at 20 CPI may overlap.)

Lines Per Inch:

LPI Code

- 6 Escape, Control-^, Control-I
(From Apple IIe, Apple IIc, or Apple IIGS using an Apple interface: Control-I, Control-A, Escape, Control-^, Control-I, Control-I, Control-A)
- 8 Escape, Control-^, Control-G

Other Commands:

	Code	
	Begin:	End:
	Escape-	Escape-
Boldface	O	&
Underline	E	R
Subscript	U	D
Superscript	D	U

Diablo commands NOT supported by the LaserWriter:

- Print suppression
- HY-PLot
- Extended Character Set (ECS)
- The ability to download printwheel information, including program mode
- The ability to override printwheel spacing for proportional fonts, although the proportional spacing offset can be changed
- Page lengths other than 11 inches
- Paper feeder control, such as Manual Feed
- Hammer energy control
- Remote diagnostic
- Backward printing control, though reverse printing is supported

Apple Modem: Specifications (Discontinued) (10/94)

Article Created: 08 April 1985
Article Reviewed/Updated: 17 October 1994

TOPIC -----

The following lists the specifications for the Apple Modem 300 and Apple Modem 1200, now discontinued.

DISCUSSION -----

Model A9M0300 300 BAUD (Discontinued)
A9M0301 1200 BAUD (Discontinued)

I. Technical Specifications

1. Transmission Speed:

- Modem 300: 0-300 BAUD
- Modem 1200:
 - a. 0-300 BAUD in Low-Speed Mode
 - b. 1200 BAUD in High-Speed Mode

2. Data Format:

- Transmission: Asynchronous
- Bits: Seven or eight data bits; one or two stop bits
- Parity: Odd, even, mark, space, or no parity
- Duplex: Full or half

3. Operating Modes:

- Answering: Auto or manual
- Dialing: Auto or manual; tone or pulse

4. Audio Monitor: Volume-control

5. Receiver Sensitivity: 0 to -45 dBm

6. Transmitter Level: -10 dBm, fixed, as per FCC part 68

7. Connectors:

1. Power
2. DB-9 data
3. Two modular telephone

8. Interface:

--RS-232-C using a DB-9 connector

9. Environmental Requirements:

--Temperature:

1. Storage: -4 to 149 degrees F (-20 to 65 degree C)
2. Operating: 13 to 112 degrees F (0 to 45 degrees C)

II. System Configuration:

1. A standard single-line telephone with a standard RJ-11 jack
2. Computer with RS-232 interface. The Apple IIe requires an Apple Super Serial Interface Card.
3. Appropriate communications software

Flat Panel Display: Specifications (Discontinued) (10/94)

Article Created: 08 April 1985
Article Reviewed/Updated: 17 October 1994

TOPIC -----

The following lists the specifications for the Apple IIc Flat Panel Display, now discontinued.

DISCUSSION -----

Model A2M4022 (Discontinued)

I. Technical Specifications

1. Electrical

- A. Video signal from IIc DB-15 video port
- B. Power:
 - Consumption: Less than 2 watts
 - Source: IIc DB-15 video port
- C. Connection:
 - Display hardwired with 5-inch flat cable to Buffer box
 - Buffer box connected with DB-15 connector to IIc
 - Simultaneous operation with monochrome monitor off the IIc

2. Environmental Requirements

- A. Temperature
 - Storage: 15 to 130 degrees F (-25 to 55 degrees C)
 - Operating: 50 to 105 degrees F (10 to 40 degrees C)
- B. Meets FCC regulations: Part 15, Class B Computing Devices

3. Physical

Dimensions in	Inches	Pounds,Ounces
---------------	--------	---------------

	Centimeters			Kilograms
	Height	Width	Depth	Weight
Main unit (Display)	5.4	11.4	1.6	2.7 (w/Buffer Box)
	13.8	29.0	4.0	1.1
Buffer Box	3.0	5.4	1.0	
	7.5	13.6	2.5	
Cable Length	5.1			
	13.0			
Tilt Angle: 0 to 45 degrees				

4. Resolution

- A. Text: 80 columns by 24 lines; 40 columns by 24 lines
- B. Graphics: Grid of 560 by 192 dots in double-high resolution mode
- C. Controls:
 - Contrast
 - Normal/Inverse

II. Package

Order A2M4022

- 1. Flat Panel Display
 - a. Cable to Buffer Box
 - b. Buffer Box
- 2. Manual: Owner's
- 3. Limited Warrany Statement
- 4. Card: Tell Apple

III. System Configuration

Apple IIc computer; power: wall socket or battery pack

TOPIC -----

The following lists the specifications for the ImageWriter 1, now discontinued.

DISCUSSION -----

I. Technical Specifications

1. Print Speed:
 - at Pica pitch (10 characters per inch):
 - a. 120 characters per second
 - b. 72 lines per minute
2. Print Method: Impact dot matrix
3. Character Format:
 - 7 x 9 Alpha-numeric symbols (fixed)
 - 16 x 8 User programmable
4. Character Set:
 - U.S. ASCII: 96 characters
 - International: 25 additional characters
 - User programmable: 25 per font, maximum of 7 fonts
5. Pitch:
 - CPI- Characters Per Inch
 - CPL- Characters Per Line
 - SW- Single Width
 - DW- Double Width
 - DPI- Dots Per Inch

Font	CPI		10" CPL		15" CPL	
	SW	DW	SW	DW	SW	DW
1. Compressed	17	8.5	136	68	230	115
2. Pica	10	5	80	40	136	80
3. 72 dots/inch:	9	4.5	72	38	122	61
4. 120 dots/inch:	15	7.5	120	60	204	102
5. 108 dots/inch:	13.4	6.7	107	65	182	91
6. Proportional 1 (160 DPI)						
7. Proportional 2 (144 DPI)						
15" only:						
8. Elite	12	6			162	81
6. Line Spacing: 6.8 LPI plus n/144"						
7. Line Feed Rate: 100ms per step (at 6 LPI)						
8. Graphics Densities: 72, 80, 96, 107, 136, 144, and 160 DPI						
9. Maximum Dots Per Line:						
--10": 576 640 786 856 960 1088 1152 1280						
--15": 976 1088 1296 1456 1632 1840 1952 2176						
10. Paper:						
A. Width:						
--10": 3 to 10 inches						
--15": 3 to 15 inches						
B. Thickness: 0.05 to 0.28 mm						
C. Format: Single cut sheet, fan-fold continuous, roll						
11. Copies: Original plus 3						
12. Ribbon:						
A. Type: Fabric (13mm x 13 meters); continuous loop						
B. Life: 2 million characters (typical)						
13. Interface:						
A. Type: RS-232 serial						
B. Buffer: 1K used for downloadable characters						
C. Baud Rates: 300 1200 2400 9600 (switched)						
D. Connector: DB-25						
14. Dimensions:						

	Inches			Pounds
	Width	Height	Depth	Weight
10"	16.2	4.8	11.8	19
15"	22	5.6	11.8	26.4

15. Electrical:

A. 120 Volts at 60 Hz

B. Power:

-- 16 W standby

--180 W printing

LaserWriter: Specifications (Discontinued 2/88)

=====

Article Created: 8 April 1985

I. Technical Specifications

1. Hardware:

- A. Marking engine: Canon LBP-CX laser-xerographic engine
- B. Controller:
 - a. Microprocessor: 12 MHz MC68000
 - b. Read only memory (ROM): .5 Megabytes
 - c. Random access memory (RAM): 1.5 Megabytes
- C. Interfacing interconnects:
 - a. AppleTalk
 - b. RS-232-C via PostScript
 - c. Special Diablo 630
- D. Noise levels:
 - a. Standby: 45 db(A)
 - b. Printing: 55db (A)

2. Software:

- A. Printing protocols supported:
 - a. PostScript
 - b. Diablo 630 (a daisy-wheel printer) Emulation with a subset of the Diablo command set
- B. Fonts:
 - a. Resident:
 - Medium and Bold: Times, Helvetica, and Courier
 - Italic and Bold Italic: Times
 - Oblique and Bold Oblique: Helvetica and Courier
 - Symbol: Greek and Scientific characters
 - b. Sources:
 - Allied Corporation: Times and Helvetica
 - PostScript: Symbol
 - c. Styles: Underline, Shadow, Hollow

d. Point sizes:

--Range: 3 to 720 points

--Limitations

1. Small: Resolution of printer

2. Large: Size of paper

C. Other Input:

All graphics and Macintosh and international character sets
are treated as downloaded bitmaps

3. Printing materials:

A. From Automatic cassette:

a. Optimum: Single sheet photocopy bond

b. Range: Letterhead and color stock

--16 to 21.33 pounds

--60 to 80 grams per square meter

c. Cassette sizes:

Size Order

Legal M0182

Letter M0181

A4 M0183

B5 M0184

d. Cassette capacity: 100 sheets

B. From manual single sheet feed:

a. Stock:

--Sheet Paper: Copier, Letterhead, and Color

--Transparency

--Envelopes

--Labels

b. Sizes:

--Letter

--Legal

--A4

--B5

c. Weight:

--11 to 34 pounds

--40 to 128 grams per square meter

C. Toner cartridge

a. Not compatible with cartridge of Canon Copier

b. Compatible with cartridge of Canon Laser Printer

c. Compatible with cartridge of HP LaserJet

4. Performance

A. Output tray capacity: 20 sheets

B. Maximum printable surface:

	Letter	Legal	A4	B5
Width (inches)	8.0	7.0	7.5	7.0
Length (inches)	10.9	12.5	10.5	10.0

- C. Print quality: text and graphics:
 - a. 300 dots per inch
 - b. 90,000 dots per square inch
 - c. over 8 million dots per page
- D. Speed
 - a. Initial: 2 to 4 pages per minute
 - b. Thereafter, the LaserWriter can produce copies of the initial page at a rate of 8 pages per minute.
 - c. Actual performance depends on the application and document.
- E. Recommended duty cycle: Less than 4000 pages per month.

5. Physical:

	inches
Width	18.5
Depth (body only)	16.2
Depth (with trays)	28.2
Height	11.5
Weight	77 pounds

6. Electrical

US Model M0156:

115 VAC (+/- 10 percent) 60 Hz

Amp requirements (maximum power utilization): 6.6 amps

European Model M0156Z:

220 VAC (+/- 10 percent) 50 Hz

240 VAC (+/- 10 percent) 50 Hz

7. Safety and Environmental Compliance

- UL 660F listed
- CSA LR49439 certified
- FCC Class B
- BRH certified Class I laser product
 - Laser unit power output: 5 milliwatts (mw)

A. Operating ranges

1. Temperature: 50 to 90.5 degrees Fahrenheit
2. Humidity: 20-80%
3. BTU output: 2599.2

II. Documentation

Inside LaserWriter (available from APDA)

III. Service

1. Every 2,000 to 3,000 pages: Replace toner cartridge
2. 100,000 pages (2.5 years given a rate of 3,000 pages per month):
 - Major service

Super Serial Card: Configuring for ImageWriter I (11/96)

Revised: 11/26/96
Security: Everyone

Super Serial Card: Configuring for ImageWriter I (11/96)

Article Created: 08 April 1985
Article Reviewed/Updated: 26 November 1996

TOPIC -----

The following describes the connection between the Super Serial Card and the 10-inch and 15-inch Imagewriters.

DISCUSSION -----

Install the Super Serial Card into slot 1, which is the left most slot when facing the front of the computer. If slot 1 is occupied, any other slot except AUX is usable.

On the Super Serial Card there is a removable block of pins with a triangle on its top face. Make sure this jumper block is plugged into its socket so that the triangle points to the word TERMINAL printed on the card.

This configuration, called modem elimination, compensates for the standard RS-232-C pin assignments so that the internal cable of the SSC can transmit signals to the Imagewriter through the appropriate pins.

SSC Switch Settings

SW1:	1	2	3	4	5	6	7	SW2:	1	2	3	4	5	6	7
				X	X X				X		X X				(ON)
	X X X	X								X X		X X			(OFF)

Switch 1

- * 9600 baud (1-4)
- * Printer Mode (5-6)
- * Normal Clear To Send (7)

Switch 2

- * 8 data bits and 1 stop bit (1)
- * No delay after CR (2)
- * Video off (3)
- * 132 character line (4)
- * Auto-LF after CR (5)
- * Disabled ACIA-CPU interrupts (6)
- * Normal Clear To Send (7).

* No parity is set automatically in the Printer Mode.

Cable pinout

Super Serial Card (SSC)	Pin	Cable	Pin	Imagewriter Connector
Frame Ground	(FG).....	1	<----->	1.....(FG)
Transmit Data	(Tx)	2	<----->	2.....(Tx)
Receive Data	(Rx)	3	<----->	3.....(Rx)
Request to send	(RTS)	4	<----->	4.....(RTS)
Clear To Send	(CTS)	5		
Data Set Ready	(DSR)	6		
Signal Ground	(SG).....	7	<----->	7.....(SG)
Data Carrier Detect	(DCD)	8		
Secondary Clear To Send	(SCTS) ...	19		
Data Terminal Ready	(DTR)	20	<----->	20.....(DTR)

Imagewriter Switch Settings

SW1:	8	7	6	5	4	3	2	1	SW2:	4	3	2	1	
				X		X						X		(CLOSED)
		X		X			X		X		X			(OPEN)

Switch 1

- * U.S. character set (SW1: 1-3)
- * 66-line page length (4)
- * Ignored 8th bit (5)
- * Elite pitch (6-7)
- * Auto-LF after CR (8)

Switch 2

- * 9600 baud (SW2: 1-2)
- * DTR data protocol (3)
- * Unknown (4).

To verify the connection, turn on the computer, video monitor, Imagewriter and wait for the Applesoft prompt,], to appear on the monitor screen. Then type these two lines, ending each line with a carriage return:

```
PR#1          (if the card is in slot 1)
This is a test
```

The Imagewriter should print "This is a test" and an Applesoft syntax error message (the error message means nothing during this test). However, if the printer does not print, recheck all connections, switch settings and retype the two test lines.

AppleWorks: Problems with output wider than 80 columns

Revised: 5/10/85
Security: Everyone

AppleWorks: Problems with output wider than 80 columns

=====

Customers are having difficulty printing AppleWorks files when lines in the file are greater than 80 columns long. This happens because the interface card adds a CR-LF after 80 columns.

To eliminate this problem:

1. Select the change printer specifications section of AppleWorks.
2. Select the desired printer and choose "6. Printer Codes".
3. Choose Characters per inch.
4. Select the spacing you want to set.
 - a. If the command to set your printer to 15 CPI is <ESC>Q, type <CTRL>I120N<ESC>Q. (Keep in mind that <CTRL>I means to hold the Control key down and press the I key, and <ESC> means press the key marked ESC).
 - b. The same setup will work for 17 CPI if 120 is replaced with 136 (<CTRL>I136N<ESC>Q).

Apple IIe Enhancement Kit: Technical Benefits (10/94)

=====

Article Created: 10 May 1985
Article Reviewed/Updated: 17 October 1994

TOPIC -----

This article documents the benefits of the Apple IIe Enhancement Kit.

DISCUSSION -----

The Apple IIe Enhancement improves the performance of the Apple IIe by replacing four chips on the main circuit board.

The Enhancement has four major benefits:

1. Apple IIc compatibility:

Users can take advantage of software developed for the Apple IIc.

2. Product line consistency:

Apple II software can be used on both the Apple IIe and IIc.

3. The MouseText character set makes it easy for developers to create software that uses pull-down menus, windows, and icons.

4. Easier programming for users:

- a. Accepts BASIC commands in both upper- and lowercase
- b. Additional instructions in the 65C02
- c. Mini-assembler for machine language programs.

The Apple IIe Enhancement Kit, Order A2M2052, is available from Apple Authorized Dealers for users who wish to upgrade their systems.

Model A9M0005 5 Megabyte (Discontinued)
A9M0100 10 Megabyte (Discontinued)

I. Technical Specifications

1. Data Storage Characteristics:

	A9M0100	A9M0005
Data Capacity (formatted)		
in megabytes:	10	5
Data Surfaces:	4	4
Heads per Surface:	1	1
Track Spacing per inch:	345	254
Tracks per Surface:	306	152
Sectors per Track:	16	16
Sectors per Surface:	4896	2432
Block Size		
in bytes:	512	512
5.25" Floppy Equivalence:	70	35

2. Drive Characteristics:

Average Seek Time		
in milliseconds:	85	180
Data Transfer Rate		
in megabits/sec:	5	5
Rotational Start-up Time		
in seconds:	20	20
Drive Ready to Operate		
in seconds:	120	60
Rotational Speed		
in RPMs +/- 1%:	3600	3600

Mean Time Between Failure:
in hours: 10,000 10,000

--Winchester technology

3. Interface:

- a. Type: 8-bit parallel
- b. Connector: DB-25
- c. Drives per Interface: 1

4. Power Requirements:

- a. U.S.: 110 VAC, 35 Watts
- b. Europe: 230 VAC
- c. Drive power source internal to the ProFile.

5. Environmental Requirements

- a. Temperature
 - Operating: 50 to 104 degrees F (10 to 40 degrees C)
 - Storage: -7.6 to 176 degrees F (-22 to 80 degrees C)
- b. Humidity
 - Operating: 20 to 80% noncondensing.
 - Storage: 1 to 95%

6. Physical Characteristics

	inches	centimeters
Height:	4.39	11.15
Width:	17.28	43.89
Depth:	8.81	22.38

	pounds	kilograms
Weight:	11	5

II. Package

With the 5 Megabyte or 10 Megabyte ProFile package:

- 1. Apple ProFile hard-disk drive
- 2. Apple ProFile Accessory Kit including:
 - a. ProFile interface cable
 - b. System-specific ProFile owner's manual
 - c. Warranty and product registration
 - d. User Input Report
- 3. Included in the Apple II Accessory Kit:
 - a. Catalyst II software
 - b. Apple II SOS Driver and Utilities software
 - c. Backup II software
 - d. Apple II ProFile Interface Card
- 4. Included in the Apple III Accessory Kit:
 - a. Catalyst 2.0 software
 - b. Pascal ProFile Manager software

- c. Backup III software
- d. Apple III ProFile Interface Card

III. System Configuration

--Either ProFile may be used the following Apple personal computers:

1. IIe
 - a. RAM: Minimum of 64 kilobytes
 - b. Operating System: ProDOS Pascal 1.2
 - c. Interface Cards:
 - The difference bewteen the 5Mb and 10Mb ProFile Interface cards is the ROM at location C6. The ROM is 341-027 for the 5Mb Card and 341-0299-B for the 10 Mb.
2. Apple III
3. Macintosh XL

NOTE: The Macintosh XL containing a built-in 10-megabyte hard disk requires a Parallel Interface Card (Order A6BB101, obsolete).

Features

Controller automatically scans for error conditions, relocating marginal data blocks elsewhere on the hard disk, if necessary.

TOPIC -----

Why can't I use a 768K memory configuration with my Apple IIgs?

DISCUSSION -----

The manual for the Apple IIGS Memory Expansion Card (copyright 1986, 030-1310-A) Chapter 3, page 11, recommends not having 768K of RAM on the card. Some applications have trouble dealing with that particular configuration.

768K of RAM can cause memory ghosting: a lower-numbered bank of memory appears if an un-equipped upper bank is addressed. This configuration also leaves gaps in the middle of the memory map, which can also confuse the Memory Manager.

If an application turns out to require exactly 768K, choose a higher amount say, 1MB.

Communications Interface: Directly controlling the 6850 ACIA

Revised: 4/8/91
Security: Everyone

Communications Interface: Directly controlling the 6850 ACIA

=====

This applies to the Apple II, II+, and IIe.

The Communications Interface Card uses an ACIA (Asynchronous Communications Interface Adapter) to automatically perform the serial transfers with an external device. The ACIA contains 4 registers that control data flow between the Apple and the external device. There are two pairs of registers and each pair has a single address in the Apple. In the following discussion, all addresses will be calculated for slot 2. The addresses can be converted to another slot with the following formula.

$$\text{New Address} = \text{Old Address} + (\text{New Slot} - 2) * 16$$

So, \$C0AE in slot 2 becomes \$C09E for slot 1.

The status/control register is at \$C0AE. Reading from \$C0AE yields the status of the ACIA, and writing to \$C0AE modifies the Operation of the ACIA (baud rate, data bits, stop bits, parity). The tables below are a summary of what the registers control. Refer to the Motorola Semiconductors Data Sheet for the MC6850 for complete details.

READ FROM STATUS REGISTER (\$C0AE)

- 0 Receive Data Register Full
- 1 Transmit Data Register Empty
- 2 -Data Carrier Detect
- 3 -Clear to Send
- 4 Framing Error
- 5 Receiver Overrun
- 6 Parity Error
- 7 Interrupt Request

WRITE TO CONTROL REGISTER (\$C0AE)

- 0-1 Baud Rate
 - 0 - Unstable at about 1200 baud

- 1 - 300 baud
- 2 - 110 baud
- 3 - Reset the ACIA

2-4 Word Control Bits

- 0 - 7 bits + Even Parity + 2 Stop Bits
- 1 - 7 bits + Odd Parity + 2 Stop Bits
- 2 - 7 bits + Even Parity + 1 Stop Bit
- 3 - 7 bits + Odd Parity + 1 Stop Bit
- 4 - 8 bits + 2 Stop Bits
- 5 - 8 bits + 1 Stop Bit
- 6 - 8 bits + Even Parity + 1 Stop Bits
- 7 - 8 bits + Odd Parity + 1 Stop Bits

5-6 Transmitter Control Bits

- 0 - -RTS = low, Transmitting Interrupt Disabled
- 1 - -RTS = low, Transmitting Interrupt Enabled
- 2 - -RTS = high, Transmitting Interrupt Disabled
- 3 - -RTS = low, Transmits a Break level on the Transmit Data Output.
Transmitting Interrupt Disabled

7 Receive Interrupt Enable Bit

- 0 - No interrupts from receiver section of ACIA
- 1 - Interrupt on:
 - Receive Data Register Full,
 - Overrun, or
 - A low to high transition on Data Carrier Detect

The data register is located at \$C0AF. A read from \$C0AF yields the data that has been received from the external device. A write to \$C0AF buffers the data and initiates its transmission. Writing or reading to the data register automatically resets the ACIA status.

An Apple II will lose data whenever it is forced to ignore the Communications Interface to either process the incoming data or write it to an I/O device like a disk drive or printer.

This problem is solved by buffering the incoming data. You can do this by:

- 1) Requesting fixed size blocks of data from the remote machine - Reading in all of one block and processing it before requesting the next one.
- 2) Writing a program to control the data flow from the remote device with XON (control S) and XOFF (control Q). The strategy is to receive data until the program's memory buffer is almost full and transmit an XOFF to halt the data flow. Process the data and transmit an XON to resume the transfer. Not all external devices understand XON/XOFF handshaking. Be sure to check your device.

When attempting to use a remote terminal from Applesoft, the output appears on one line of the terminal's screen. To avoid this problem, use the Communications Card Print routine on page 28 of the Communications Interface Card manual. If you are using DOS 3.2 or later you must modify this routine

with a POKE 845,110 before saving it to disk.

Modifying the default parameter settings on the Communications card is described on page 27 of the Communications Interface Manual. But please note that the PR#s and IN#s commands do not initialize the interface, they only reset the I/O vectors. It's the first character through the interface that loads the default parameters. So be sure to PRINT or INPUT at least one character before doing the POKES.

Communications Interface Card: Echo Suppression (11/96)

Revised: 11/21/96
Security: Everyone

Communications Interface Card: Echo Suppression (11/96)

Article Created: 19 May 1985
Article Reviewed/Updated: 18 November 1996

TOPIC -----

The Communications Interface allows a BASIC program to communicate with another computer. Normally, the information coming in from the other computer will be displayed on the screen, which is not always desirable. The two routines below will disable the echo feature but you must decide which best fits your program.

DISCUSSION -----

Machine Language

First determine which slot the interface card is in before typing in the software patch. The patch is customized for this slot number and will not work if used with a different configuration. Enter the patch using the values from the table for words in brackets, < >.

SLOT	1	2	3	4	5	6	7
STAT	9E	AE	BE	CE	DE	EE	FE
DATA	9F	AF	BF	CF	DF	EF	FF

Enter the monitor with CALL -155 and type

```
3A0:A9 03
3A2:8D <STAT> C0
3A5:A9 11
3A7:8D <STAT> C0
3AA:A9 B5
3AC:85 38
3AE:A9 03
3B0:85 39
3B2:4C EA 03
```

```
3B5:91 28
3B7:AD <STAT> C0
3BA:10 FB
3BC:AD <DATA> C0
3BF:09 80
3C1:60
3C2:00 00 00 00 00
```

To check your typing, type "3A0L", and compare your listing to the one for slot 2 shown below.

```
03A0-   A9 03      LDA   #$03
03A2-   8D AE C0   STA   $C0AE
03A5-   A9 11      LDA   #$11
03A7-   8D AE C0   STA   $C0AE
03AA-   A9 B5      LDA   #$B5
03AC-   85 38      STA   $38
03AE-   A9 03      LDA   #$03
03B0-   85 39      STA   $39
03B2-   4C EA 03   JMP   $03EA
03B5-   91 28      STA   ($28),Y
03B7-   AD AE C0   LDA   $C0AE
03BA-   10 FB      BPL   $03B7
03BC-   AD AF C0   LDA   $C0AF
03BF-   09 80      ORA   #$80
03C1-   60        RTS
03C2-   00        BRK
03C3-   00        BRK
03C4-   00        BRK
03C5-   00        BRK
03C6-   00        BRK
```

Now return to BASIC by typing 3D0G

Save the patch to disk BSAVE PATCH, A\$3A0, L\$21:

Using the patch

The first time you use the interface you must load the patch into memory and initialize the interface. This can be done from a BASIC program by adding the following lines.

```
100 PRINT D$;"BLOAD PATCH": CALL 928  (loads patch and turns off echo)
200 PRINT D$;"IN#0"                  (will re-enable the Apple keyboard)
300 CALL 938                          (reconnects the interface)
```

Video Echo

The video echo can be stopped by fooling the interface into thinking it is in full duplex terminal mode, as running the following BASIC program demonstrates.

```
10 SLOT = 2
20 PRINT CHR$(4);"PR# SLOT"
30 PRINT
40 POKE 1912 + SLOT,145
50 PRINT "THIS WON'T ECHO"
60 POKE 1912 + SLOT,11
70 PRINT "THIS WILL ECHO"
90 PRINT CHR$(4);"PR# 0"
```

Communications Interface Card: Manual Errata (11/96)

=====

Article Created: 19 May 1985
Article Reviewed/Updated: 18 November 1996

TOPIC -----

Listed below are corrections to the Communications Interface card manual
030-0008-01.

DISCUSSION -----

Corrections
=====

Page 17

The lower case info only applies to TERMINAL modes and the method to use it is not obvious. Also, the POKE 1784+n,160 causes the lower case to be displayed as FLASHING. POKE 1784+n,224 will cause lower case to be INVERSE.

Page 24

DATAMOVER will not work with Applesoft. It will require a complete re-write of the program.

Page 28

The Communications Card Print Routine was written when the only available DOS was version 3.1. POKE 845,110 will fix it to work with DOS 3.2 or DOS 3.3.

Page 36

The modification for 4800 baud in the manual is missing a wire. Add a wire from pin 15 of A1 to pin 15 of A2. Chip A1 is still not required.

Communications Interface Card: Terminal Mode (11/96)

=====
Article Created: 19 May 1985
Article Reviewed/Updated: 18 November 1996

TOPIC -----

The following BASIC program will initialize the Communication Interface and enter into terminal mode.

DISCUSSION -----

This is the same as using IN#2<CTRL-A><CTRL-F>. The BASIC program can set up non-standard parity options and perform automatic sign-on functions before entering terminal mode.

```
10 SLOT = 2
20 ST = 17: REM This is the status from page 27.
30 CN = 192 + SLOT
40 N0 = 16 * SLOT
50 POKE 2040,CN
60 POKE 1784 + SLOT,32
70 POKE 1912 + SLOT,ST
80 POKE 2040 + SLOT,ST
90 POKE 16242 + N0,3
100 POKE 16242 + N0,ST
110 POKE 768,72: POKE 769,72: POKE 770,72
120 POKE 771,169: POKE 772,152
130 POKE 773,160: POKE 774,192 + SLOT
140 POKE 775,162: POKE 776,16 * SLOT
150 POKE 777,76: POKE 778,165: POKE 779,192 + SLOT
160 CALL 768
170 REM NOW IN TERMINAL MODE...
```

Receiving Lower Case

The lower case information on page 17 of the Communications Interface Card

..TIL01141-Communications_Interface_Card-Terminal_Mode_11-96.pdf

manual is only effective in terminal mode. To display lower case characters in inverse you need to type in the following:

```
POKE 1784+slot,224  
IN# slot  
CTRL-A CTRL-F
```

Apples with lower case display capability can receive true ASCII after typing in:

```
POKE 1784+slot,0  
IN# slot  
CTRL-A CTRL-F
```

Lisa 7/7: Upgrade to OS 3.1 w/Pascal Workshop 3.0 on hard disk

Revised: 10/17/94
Security: Everyone

Lisa 7/7: Upgrade to OS 3.1 w/Pascal Workshop 3.0 on hard disk

=====

To upgrade Lisa 7/7 Office System software to 3.1 if the hard disk already contains both the Lisa 7/7 Office System 3.0 and Pascal Workshop 3.0:

1. While in the Workshop environment, insert the Release 3.1 Office System 2 diskette into the microdrive.
2. From the Workshop command line, type R.
3. When asked which file you wish to run, type: " <-lower-StartUpdate".
4. Press the RETURN key.
5. You are then guided through the process of updating the system libraries. After answering a series of questions, follow the prompts to insert the necessary disks.
6. Since the update process changes the libraries on the startup disk,
 - a. Restart the Lisa when you've completed step 5.
 - b. Replace the LisaWrite and LisaProject tools and stationary pads on the hard disk with the updated versions.

Using Apple Computers in Hospital Environments (10/94)

Revised: 10/17/94
Security: Everyone

Using Apple Computers in Hospital Environments (10/94)

Article Created: 01 July 1985
Article Reviewed/Updated: 17 October 1994

TOPIC -----

Do you have any information on electrical or environmental considerations when using Apple equipment in hospital environments?

DISCUSSION -----

To dispense with any electricity that may stray from the circuits in the unit, computers are electrically grounded, which lets this excess electricity pass from the system through the case of the computer itself. This flow to the grounded case is called current leakage.

While current leakage in Apple computers is usually low, this flow of electricity to the grounded case may be high enough to disturb equipment that is important to a patient's stability or to generate a spark that could ignite an explosion in an oxygen-rich environment, like an oxygen tent.

Computers used in a hospital environment have different current leakage acceptable levels under different circumstances, such as non-patient use, patient monitoring, and patient connection.

Current leakage is measured in microamps (μ a) and occurs between the hot or positive AC line and the green wire (ground).

Situation	Current Leakage Acceptable Levels (μ a)
-----	-----
Non-patient office work	less than 500
Patient monitoring	less than 100
Connected directly to the patient	less than 10

These requirements are for the safety of both hospital personnel and patients.

The maximum current leakage allowed by the UL specification is 0.5 milliamps

(ma). Apple Computer monitors meet this UL specification.

Note: Apple Computer does not test Apple equipment for hospital AAMI/ANSI compliance certifications. However, depending on an individual institution's certification requirements, Apple equipment may be able to be used in certain work areas. Before installing equipment, Apple customers need to check the hospital's certification requirements for the work area where the equipment is to be installed.

AppleWorks IIe: Using codes for special text styles

Revised: 7/1/85
Security: Everyone

AppleWorks IIe: Using codes for special text styles

=====

The word processor section of AppleWorks, when running on a IIe with Super Serial Card and Imagewriter, can produce text which is centered, underlined, boldfaced and superscripted.

Failures can occur, however, when:

1. The text file omits the codes to turn off the underline, boldface and superscript styles. This problem usually occurs when a carriage return is placed to turn off the styles.
2. The three special features are NOT turned off the order opposite from the order in which they were turned on. This occurs, for example, when the codes BB +B UB are followed by text and then +E BE UE. The codes BB +B UB should be followed by some text and then the codes UE +E BE.

The product manager has received reports of this problem.

AppleWorks: Rounding Techniques

Revised: 10/20/86
Security: Everyone

AppleWorks: Rounding Techniques

=====

AppleWorks' spreadsheet provides different rounding techniques that can be used either to display or calculate numbers to varying decimal places. Choose the technique below that best applies to your situation and the version of AppleWorks you are using.

There are two ways of truncating numbers. The first, called the "integer" of a number, merely drops any decimal value the number might have. (The integer of 2.56 is 2.) The second type, called "rounding", changes the number to the closest value with the desired precision. For example, 2.56, rounded to the nearest integer, is 3. 2.56 rounded to the nearest tenth is 2.6.

AppleWorks can accommodate both types of calculations. All versions of AppleWorks include the INT function, which results in the integer of a number. A cell with the formula "@INT(3.12)" will display 3.

A ROUND function is available in AppleWorks 2.0 only. It accepts two parameters; the value to be rounded, and the number of decimal places of precision. The second argument (number of decimal places) is converted to an integer, and must be in the range from -15 to +15, inclusive. If the number of decimal places is 1, then the value is rounded to the nearest tenth. If the number of decimal places is -1, the value is rounded to the nearest multiple of 10. The formula "@ROUND(5.4613,1)" will result in the value 5.5, since one decimal place has been requested.

A rounding effect can also be forced by using the spreadsheet layout options. Choosing a fixed value format alters the spreadsheet to display only the number of decimal places requested. It does not change the value contained by the cell, so that dependent calculations will continue to use the more precise value.

Situations sometimes occur in AppleWorks that cause incorrect (or unexpected) values to appear. For example, if the value 1.17 is entered into cell A1, and cell A2 uses the formula @INT(A1*100)/100, then A2 would be expected to display the value 1.17. Problems with binary/decimal conversion make A2's value 1.16. To correct this, use the formula @INT(A1*100+.000001)/100 in cell A2, which delivers 1.17. This type of correction will work with all versions

of AppleWorks.

These anomalies normally appear only as the result of calculations, as in the above example. In those cases, use a formula like the one above to bring the answer into agreement with expectations. The formula should be of this type:

```
@INT(cell * n + .000001) / n
```

where "cell" represent the cell with the number or calculation to be massaged, and "n" represents a power of 10. If you wish to have two decimal places displayed in the answer, use n = 100. N = 1000 will give results to thousandths place, n = 10 is appropriate for one decimal place, etc. The value ".000001" isn't absolute; it just needs to be a very small value relative to the value in "cell".

Configuring the ImageWriter to the Apple IIfc

Revised: 8/10/87
Security: Everyone

Configuring the ImageWriter to the Apple IIfc

=====

Both Imagewriters are shipped with their switch settings configured to work on the Apple IIfc.

To work with the Apple IIfc, the Imagewriter's switch settings should be:

```
SW1: 8 7 6 5 4 3 2 1
      | | | | |X|X| | | CLOSED
      |X|X|X|X| | |X|X| OPEN
```

Switch 5 of SW1 may be open when the Imagewriter is shipped)

```
SW2:      4 3 2 1
          | | |X|X| CLOSED
          |X|X| | | OPEN
```

The position of SW2's switch 4 doesn't matter, since it's unused.

AppleWorks: Seeing more categories in a database document

Revised: 7/1/85
Security: Everyone

AppleWorks: Seeing more categories in a database document

=====

In database documents, there are two 'screen formats', or ways of seeing the information on the screen: the multiple record format and the single record format. The multiple record format displays the categories across the screen from left to right. While a touch of the tab key moves the cursor to the right to the next category, you can't see the information in the categories that aren't already displayed.

The single record format can display categories that the multiple record format doesn't display. To see this format, hold down the Open Apple key and touch the Z key. In this format, the categories initially appear at the left side of the screen in a list.

The other option is to go to the Report Format. Then you can scroll back and forth using the arrow keys.

LisaDraw: Specifications (Discontinued)

=====

I. LisaDraw: A6D0300 (Discontinued)

--Includes: LisaCalc, LisaProject, LisaGraph, LisaList, LisaWrite,
LisaTerminal and the Lisa Office System.

Available from Sun Remarketing,
P. O. Box 4059, Logan, Utah 84321
(801) 752-7631

1. Maximum Drawing Size: 32 sq. feet; about 60 pages

2. Palette Selections:

- A. Rectangles: with and without rounded corners
- B. Circles and ellipses
- C. Lines:
 - a. Horizontal, vertical and diagonal
 - b. Thicknesses: fine, narrow, medium, wide
 - c. 36 patterns
 - d. Shades: black, grey, white
 - e. Arrowhead feature: one or both ends
- D. Arcs
- E. Polygons
- F. Freehand
- G. 36 patterns: for filling objects or defining shade of lines

3. Text Editing:

- A. Add text to any part of drawing
- B. Cut, Copy and Paste; same as in other Lisa applications

4. Graphics Editing:

- A. Move any object or shape
- B. Place objects in front of or behind others
- C. Shrink or expand any object yet maintain its shape

- D. Reshape freehand curves, arcs and polygons
- E. Automatically smooth curves
- F. Copy or delete any object
- G. Change pattern of shading inside a shape or object
- H. Rotate objects: left, right, horizontal, vertical

5. Colors and Shades:

- A. 36 shades (for objects, text, lines)
- B. 8 printable colors (Cannon Ink Jet Printer required to print colors)

6. Alignment Aids:

- A. Grids:
 - a. Displayable on screen in various sizes
 - b. Able to align objects to grid
- B. Rulers:
 - a. Horizontal and vertical
 - b. Increments: inches, centimeters, or custom
- C. Align middles, centers, either side, top or bottom of object
- D. Align to Auto-Grid
- E. Measure distance between two points or the size of objects
- F. Group shapes or objects to move, copy or delete them together

7. Zoom

- A. Reduce to Fit
- B. Reduce 70%

8. Typestyles:

- A. Variety of fonts and sizes available
- B. Bold, italic, underline, outline, shadow or any combination

9. Features:

- A. Undo function: cancels effects of last operation
- B. Revert To Previous Version: undoes all changes made since document was last saved
- C. Display more than one document on the screen at the same time

10. Special Features:

- A. Move LisaGraph and LisaProject charts into LisaDraw for further customization
- B. LOCK allows you to protect objects from accidental editing

11. Printing:

- A. Prints in horizontal (landscape) or vertical (portrait) formats
- B. Prints single or multiple copies
- D. Printers supported:
 - 1. Apple Dot Matrix Printer

..TIL01155-LisaDraw-Specifications_Discontinued.pdf

2. Apple Imagewriter: narrow or wide carriage
 3. Apple Daisy Wheel Printer
 4. Cannon Ink Jet Printer
- E. Background printing: prints one or more documents while displaying another

12. Documentation: Reference guide (including tutorial).

Macintosh Pascal: Specifications (Discontinued)

Revised: 9/24/93
Security: Everyone

Macintosh Pascal: Specifications (Discontinued)

=====

I. Macintosh Pascal: M0523

--Includes: Master and backup diskette
Macintosh Pascal User's Guide
Macintosh Pascal Reference Manual
Macintosh Pascal Technical Appendix

1. Compatibility:

- A. Conforms to IEEE Numerics Standard (SANE)
- B. Compatible with Lisa Pascal:
 - Most differences arise from extensions to or generalizations of LisaPascal features: differences are documented.
- C. Compatible with American National Standard Pascal

2. Environment:

- A. Utilizes the Macintosh interface: windows, mouse cursor positioning, cutting and pasting, pull-down menus
- B. Interactive and interpretive: you don't have to recompile your program each time you modify it.

3. Maximum Size:

To minimize disk I/O, the system uses the greatest amount possible of RAM memory to keep Macintosh Pascal resident.

- A. 128K Macintosh: 35K or 500 lines
 - Shared amongst the program text, variables, pseudo code representation, debugging information, and libraires.
- B. 512K Macintosh or Macintosh XL: 64K or 1000 lines
 - Limited by pointers.

4. Error Checking:

- A. Bug Dialog Box: displayed when program encounters a bug
- B. Step Feature: executes program line by line
 - a. Automatic
 - b. Manual
- D. Syntax Scan
- F. Thumbs-down Symbol: displayed when syntax or run-time errors are discovered
- G. Trace: shows what statements are being executed

5. Editing Features:

- A. Enables user to stop the program, look at the variables, change the variables, then resume execution of the program
- B. Enables user to set break points

6. Libraries:

- A. Supports predefined libraries accessed via a uses-clause

7. Windows:

- A. Edit: for entering or modifying your program
- B. Text: for text input and output
- C. Drawing: for displaying graphics
- D. Instant: execute any valid Pascal statement anytime
- E. Observe: the current value of keyed-in expressions, usually variable names, appear in the window whenever the program stops.

8. File Access:

- A. Open (instead of reset or rewrite): Open a file for random read/write access to it
- B. Seek procedure: set for random access to file components

6. Special Features:

- A. SANE (Standard Apple Numerics Environment)
- B. Access to all QuickDraw routines, as well as the mouse, sound driver and other Macintosh ROM routines
- C. Change window size, modify the cursor, interact with the mouse and keyboard, perform file I/O, etc
- D. Search function
- F. Otherwise clause in case statement
- G. Automatic indentation of program text and boldfacing capabilities
- H. Macintosh Pascal works on the Macintosh XL with MacWorks.
Some functions, such as the sound driver, aren't supported.

NOTE: Though you can access the Macintosh Toolbox with the InLine function, this function is neither documented nor supported; furthermore, careless or erroneous use of the Inline function can be fatal to your diskettes or data. For documentation on the Toolbox, see "Inside Macintosh".

DuoDisk: Data damage caused by rebooting with OA-CTRL-RESET

=====

This article last reviewed: 1 July 1985

If you reboot with OA-CTRL-RESET, you can cause damage to data on a diskette in a DuoDisk. Software manufactured by PFS and Electronic Arts is especially prone to such damage. If a unit exhibits only this problem, check the part number on the analog board. Boards with part numbers 676-X101 and 676-X102 may have this problem. Macro is presently fixing all boards as they come in for repair.

The fix is to take the two capacitors labelled C29 and C30, found at locations B1 and A1, and cut them off the board. To complete the SRO form properly, use adjustment part number 011-7025 and write "DuoDisk capacitor fix" in the comment section.

LaserWriter: Using it with an IBM PC XT and Microsoft Word 2.0

Revised: 3/4/90
Security: Everyone

LaserWriter: Using it with an IBM PC XT and Microsoft Word 2.0

=====

This article last reviewed: 1 July 1985

This configuration does NOT support Diablo 630 Emulation on the LaserWriter;
to use the IBM PC XT with the LaserWriter, search this database for
"SUPERSPOOL".

I. IBM PC XT

1. Memory: 256K
2. Serial Interface: RS-232
3. Disk: DOS Version 2.1 or a further revision
 - A. DOS 2.1
 - B. DOS file: MODE.COM
4. Disk: Microsoft Word Utilities
 - A. File: MSSETUP.PS
 - B. File: APPLASER.PRD
5. Disk: Microsoft Word Version 2.00 (for IBM)
 - A. Copy onto this disk the file "APPLASER.PRD" from the Microsoft Word Utilities Disk.
6. File: Boot file
 - A. This file must be on either of two disks:
 1. On the program disk for Microsoft Word Version 2.00 for IBM. Copy onto this disk the file "MSSETUP.PS" from the Microsoft Word Utilities disk and the file "MODE.COM" from the DOS disk.

or

2. On a separate "boot" disk to precede the Microsoft Word program disk. To create this separate boot disk, either:
 - a. Make a duplicate disk of DOS 2.1 and copy onto this duplicate disk the file "MODE.COM" from DOS and the file "MSSETUP.PS" from the Microsoft Word Utilities disk.
 - or b. Format a disk by issuing the command "/S" and copy onto this disk DOS 2.1, the file "MODE.COM" from DOS, and the file "MSSETUP.PS" from the Microsoft Word Utilities disk.
- C. Load drive A of the IBM PC XT with the program disk from step 4.A.1 or boot disk from step 4.A.1.a or 4.A.1.b.
- D. Power on the IBM.
- E. Type the following lines. They will be the boot file. The lines are:

```
copy con autoexec.bat.  
mode com1:9600,n,8,1  
copy mssetup.ps com1:
```
- F. Hold down the Control Key and type "Z". Then touch the Return key. This closes the boot file "autoexec.bat" and copies it to the diskette in drive A.

II. The Connection

1. Turn off the Laserwriter.
2. DISconnect AppleTalk.
3. Get a standard 25-pin RS-232 cable and a modem eliminator cable.
4. Connect the standard RS-232 cable to the IBM PC XT communication port 1.
5. Connect the modem eliminator cable to the free end of the RS-232 cable.
6. Connect the the free end of the modem eliminator cable to the 25-pin connector on the Laserwriter.
7. If the IBM PC is on, power it off. Then turn it back on. This power off and on is necessary when the communication port is being used.

III. Laserwriter

1. Set the Mode Switch on the Laserwriter to 9600.

IV. Initializing the Laserwriter and IBM PC XT for operating Microsoft Word

1. Turn on the LaserWriter; it will print a page at start up as a test document.
2. Insert the disk with the boot file in drive A of the IBM PC XT.
3. Boot the IBM PC XT.
4. The LaserWriter will print "Ready for Microsoft Word Output".

Apple Writer IIe under ProDOS: Underlining center justify text

Revised: 7/15/86
Security: Everyone

Apple Writer IIe under ProDOS: Underlining center justify text

=====

If you center justify a line of text and use the backslash command to underline it, the leading spaces will also be underlined.

The work around is to use the Control-V sequence outlined in the second part of the article "Apple Writer IIe: How to underline words".

Here are the keystrokes if you are using an ImageWriter:

Underline

1. Begins: CTRL-V ESC X CTRL-V
2. Ends: CTRL-V ESC Y CTRL-V

C. Itoh ProWriter 8510 BCD printer: Using it with an Apple IIC

Revised: 7/9/85
Security: Everyone

C. Itoh ProWriter 8510 BCD printer: Using it with an Apple IIC

=====

The default switch settings of the ProWriter at time of purchase do not allow the printer to print successfully from a IIC. In order to solve this problem, you will need to reset some of the switches on the ProWriter--in some cases to non-standard settings. The most important switches to reset are those that deal with 7 or 8 data input, RS232-C protocol, and RDY/Busy signals. Once these are set properly, you should be able to use a normal printer cable with good results. The switch settings need to be as follows:

X = "OPEN"
O = "CLOSED"

Switch 1

1-OPEN
2-CLOSED
3-OPEN
4-OPEN
5-CLOSED (Processing of DC1 or DC3 signal is not necessary)
6-OPEN
7-OPEN
8-OPEN

Switch 2

1-CLOSED (Prints zero with a slash through it)
2-OPEN
3-OPEN
4-OPEN
5-OPEN
6-CLOSED (Set to ignore 8th bit so it will work correctly)
7-CLOSED
8-OPEN

Switch 21

1-OPEN (1 stop bit)

2-CLOSED
3-OPEN (NONE Parity)
4-CLOSED
5-OPEN
6-OPEN (8-Bit. This is important setting)
7-OPEN (RDY/BUSY)
8-OPEN

Switch 22

1-OPEN
2-OPEN (9600 Baud. All of these are important settings)
3-OPEN
4-OPEN

Switch 23

1-CLOSED (RS232-C)
2-OPEN
3-OPEN
4-CLOSED (3,4,5 are set to RS232-C)
5-OPEN
6-OPEN

Switch 24

1-CLOSED (RDY Busy)
2-OPEN
3-OPEN
4-CLOSED
5-CLOSED
6-OPEN
7-OPEN
8-CLOSED

--AppleWorks Printer Setting:

All the codes for the Apple ImageWriter work correctly in the ProWriter except for Proportional 2, subscripts and superscripts. Select ImageWriter as the printer you want to print to, but call it a "C.Itch."

LisaGraph: Specifications (Discontinued)

=====

I. LisaGraph: A6D0300 (Discontinued)

--Includes: LisaCalc, LisaProject, LisaDraw, LisaList, LisaWrite,
LisaTerminal and the Lisa Office System.

Available from Sun Remarketing,
P. O. Box 4059, Logan, Utah 84321
(801) 752-7631

1. Graph Types:

- A. Bar
- B. Line
- C. Mixed bar/line
- D. Clustered bar (up to 8 bars per cluster)
- E. Scatter
- F. Pie

2. Maximum Size:

- A. Data Points: More than 2,000
- B. Plots up to 9 columns (sets) of data

3. Titles:

- A. Graph title and subtitle
- B. X and Y axis title
- C. Footnotes and legends
- D. Free-floating: text may be placed anywhere on graph

4. Data Entry:

- A. Simple table for data entry
- B. Copy and paste data from LisaCalc and LisaList

5. Editing:

- A. Cut, Copy, and Paste: same as in other Lisa applications
- B. Editing of data within cells
- C. Edit graph titles
- D. Insert new or delete row or column in data table
- E. Paste into LisaDraw for further customizing

6. Formatting:

- A. Grid lines: on or off
- B. Legends: on or off
- C. Graph sizes: 1/4, 1/3, 1/2 or full page
- D. Axis: ranges and increments created manually or automatically
- E. Table:
 - 1. Variable width columns
 - 2. Left, right or center alignments
 - 3. Integer, decimal, scientific or money formats

7. Typestyles:

- A. Table: A variety of fonts available:
- B. Titles: A variety of fonts available plus bold, italic, underlined, shadow, hollow or any combination of styles

8. Performance:

- A. Time required to replot: usually less than one second

9. Special Features:

- A. Undo function: cancels effects of last operation
- B. Revert To Previous Version: undoes all changes made to the graph since it was last saved
- C. Display more than one document on the screen at the same time
- D. Enlarge or shrink viewing areas for graph or data-entry table
- E. Enter text anywhere on the screen
- F. Copy graph and Paste into LisaDraw for further embellishments

10. Printing:

- A. "What you see is what you get" fidelity
- B. Print graph and/or table
- C. Print in horizontal or vertical formats
- D. Print single or multiple copies
- E. Works with many printers:
 - a. Apple Dot Matrix Printer
 - b. Apple Imagewriter: narrow or wide carriage
 - c. Apple Daisy Wheel Printer
 - d. Cannon Ink Jet Printer
- F. Background printing: enables you to print one or more documents while working on another

MacProject: Specifications (Discontinued)

=====

This article last reviewed: 3 July 1985

I. MacProject: M0525

--Includes: MacProject manual
Program and backup diskette
Guided Tour cassette tape and diskette

1. Charts:

- A. Schedule
- B. Resource Timeline
- C. Task Timeline
- D. Task Cost Entry
- E. Resource Cost Entry
- F. Cash Flow Table
- G. Project Table

2. Maximum Capacity:

- A. Task Boxes:
 - a. 128K Macintosh: 200
 - b. Macintosh 512K or XL: 2,000
 - c. Title: up to 63 characters
- B. Resources:
 - a. Per task: 6
 - b. Per project: 50
 - c. May be assigned to unlimited number of tasks
- C. Size: 94 x 48"
- D. Holidays: unlimited
- E. Project time span: 11 years

3. Date/Calendar Options:

- A. Timeline scale: 1 minute, 30 min., 1 hr., 1 day, 1 or 2 weeks,

1 month or 1 quarter.

- B. Duration scale: minutes, hours, days, weeks, months or fractional durations: e.g., 1.5 days
- C. Work hours: up to 24 per day
- D. Work days: up to 7 per week
- E. Costs:
 - a. Fixed-one-time costs
 - b. Accumulating-resource costs
- F. Cash-flow table: tracks money period by period

4. Editing:

- A. Annotation: the user can annotate all of the chart
- B. Cut, Paste, Copy, Clear: same as with other Macintosh applications
- C. Autoscroll: facilitates selecting more than one screenfull
- D. Cut and Paste, into:
 - a. MacPaint: 1 screen full at a time
 - b. MacWrite: 1 screen full at a time
 - c. MacDraw: 1 vertical page width
 - d. Another MacProject: entire document
- E. Proportionally expand or shrink task boxes
- F. Able to select multiple task boxes

5. Typesyles: A variety of fonts, sizes and styles available

6. Printing:

- A. Print whole document or selected pages
- B. Print one or multiple copies
- C. Print in horizontal or vertical formats

7. Special Features:

- A. Recalculates the entire project after every change
- B. Smart redraw: only redraws the dates that have changed
- C. Capable of using the 15" Imagewriter
- D. MacProject works on the Macintosh XL with MacWorks
- E. Start and finish dates (early and late) for each project task as well as for the entire project calculated automatically
- F. Critical path distinguishable by highlighted task boxes

MacTerminal: Specifications (Discontinued)

=====

I. MacTerminal: M0521

--Includes: MacTerminal Manual
Program and back up diskette

1. Terminals Emulated:

- A. VT100/VT52
- B. TTY
- C. ANSI
- D. IBM 3278 (when used with AppleLine or Apple Cluster Controller)

2. Maximum Size: Dependent upon available storage space

3. Transmission:

- A. Speed (baud): 50, 75, 110, 134.5, 150, 200, 300, 600, 1200,
1800, 2000, 2400, 3600, 4800, 9600, 19200
- B. Asynchronous communication
- C. Full- or half-duplex

4. Terminal Settings:

- A. Character sets: United States, United Kingdom
- B. Line widths: 80 or 132 columns
- C. Status Lights: on/off
- D. Auto Repeat: on/off
- E. Auto Wraparound: on/off
- F. New Line: on/off
- G. On-line/Local option
- H. Answerback Message

5. Compatibility Settings:

- A. Supports either the modem or printer port

- B. Bits per character: 7 or 8
- C. Parity: Even, Odd, None
- D. Xon/Xoff

6. File Transfer Options:

- A. Text
- B. MacBinary
- C. XModem Text
- D. MacTerminal 1.1
- E. Straight XModem

7. Special Features:

- A. Cut and Paste text to or from MacTeminal
- B. Supports full Mac-to-Mac file transfer capability enabling you to send any Macintosh document to another Macintosh document or application using XModem protocol
- C. Dialog boxes and forms simplify the steps in configuring the program to communicate with other terminals
- D. Save data with the option Record Lines Off Top; scroll back through the data (not available in 3278 mode)
- E. Margin bell
- F. Supports Upper- and lower-case characters
- G. Print a selected area
- H. Reset to an empty document configured as when saved last
- I. Tab ruler
- J. MacTerminal works on the Macintosh XL with MacWorks
- K. Supports the Apple 300 and 1200 modems as well as most features of Hayes compatible modems

MacWrite 4.5: Specifications (Discontinued)

=====

This article last reviewed: 3 July 1985

I. MacWrite 4.5:

--Includes: MacWrite Manual
MacWrite diskette

A. Maximum Capacity Dependent upon available storage space

1. 128K Macintosh
 - a. 500 paragraphs
 - b. 2950 characters per paragraph
 - c. 1 return per paragraph
 - d. 60 pages
2. 512K Macintosh or Macintosh XL
 - a. 2047 paragraphs
 - b. 2950 characters per paragraph
 - c. 1 return per paragraph
 - d. 250 pages

B. Maximum Viewing Area:

1. Macintosh XL: 8-1/4"
2. Macintosh 128 or 512K: 7-1/8"

C. Typestyles:

1. Variety of fonts, sizes and styles available
2. Maximum font changes per line: no limit

D. Editing:

1. Inserting text: select location with the mouse and type
2. Edit any text length:
 - a. Single characters and words
 - b. Entire document
3. Search & Replace whole or partial words

E. Ruler Options:

1. Right, center, left and full-justification
2. Six lines per inch option (standard typewriter spacing)
3. Smallest scale of the ruler: 1/8"
4. Maximum number of tabs per line: 10
 - a. Decimal or
 - b. Regular left flush
5. Minimum space between tabs: 3/16"
6. Indent or outdent paragraphs
7. Margins:
 - a. Minimum left: 1"
 - b. Maximum right: 8 1/8"
 - c. Cannot be within 2" of one another
 - d. Cannot be within 3/8" of a tab

F. Header/Footers:

1. Size: up to 7 lines, approximately 1/3 of a page
2. Automatic pagination: able to set starting number

G. Page Layout:

1. Title page option: no header or footer on the first page
2. Scrolling:
 - a. single line
 - b. page, or
 - c. go to a specific page
3. Page breaks: automatic or manual

H. Printing Options:

1. Print whole document or selected pages
2. One or multiple copies
3. Horizontal or vertical formats
4. Imagewriter: 50% reduction option
5. LaserWriter: 25% reduction to 400% enlargement option
6. Macintosh display and Imagewriter printing are both bit-mapped, so the display accurately previews Imagewriter printing.

I. Special Features:

1. Page location recorded on vertical elevator
2. Accepts graphics or text from other Mac programs
3. Option to save document as text only: doesn't contain format or font information
4. Undo function cancels effects of last operation
5. MacWrite works on the Macintosh XL with MacWorks.

- H. Answer-back message on/off
- I. Margin bell
- J. On-line/local
- K. Serial Port A or B

5. Page Layout Options:

- A. Cursor: Block or bar shape
- B. Background: White or black
- C. 80 or 132 columns
- D. Status lights on/off
- E. Characters: Upper- and lowercase
- F. Tabs and rulers

6. Terminal Control:

- A. Function keys (such as RETURN, TAB, ESC)
- B. Cursor control codes (such as NUL, ENQ, FF, DEL)
- C. Supports all VT100 and VT52 function codes
- D. Special graphic character codes

7. Special Features:

- A. Supports communication while you use other Office System documents
- B. Cut and Paste text from and to other Lisa applications
- C. Dialog boxes and forms simplify the steps in configuring the program to communicate with other terminals.
- D. Save data with the Record Lines Off Top option; scroll back through the data (not available in 3278 mode)

8. Documentation: Reference Guide

LisaCalc: Specifications (Discontinued)

Revised: 10/7/93
Security: Everyone

LisaCalc: Specifications (Discontinued)

=====

I. LisaCalc: A6D0300 (Discontinued)

Available from Sun Remarketing,
P. O. Box 4059, Logan, Utah 84321
(801) 752-7631.

--Includes: LisaDraw, LisaList, LisaGraph, LisaWrite, LisaTerminal,
LisaProject and the Lisa Office System.

1. Maximum Size:

- A. Dimensions: 255 rows by 255 columns
- B. Visible: 15 columns (8 characters each) by 29 rows
- C. Memory (recommended limit): 400 blocks

2. Precision and Accuracy:

- A. Standard IEEE numerics for calculations
- B. 15 digits for high-precision calculations

3. Editing:

- A. Cut, Copy, Paste and Clear
- B. Insert new rows or columns
- C. Copy values or formulas from or into other models

4. Formatting:

- A. Left, right and center justification
- B. Variable column widths: 1 to 80 characters
- C. Numbers:
 - a. Integer, decimal, and exponential
 - b. Variable number of digits after decimal or exponent
- D. Money: commas, dollar signs, cents
- E. Negative money values may be displayed in brackets

F. Fill Pattern

5. Functions:

- A. Addition, subtraction, multiplication, division
- B. Sum, average, minimum, maximum, count, exponent
- C. NPV, compound interest factor, annuity factor
- D. Absolute value, integer portion, round
- E. Log, natural log, square root, sum of squares
- F. Sin, asin, cos, acos, tan, atan
- G. Lookup
- H. Integer division with remainder
- I. Boolean: and, or, not, if-then-else
- J. Equal, not equal
- K. Greater and less than, greater than or equal, less than or equal
- L. NA, error

6. Date/Calendar:

- A. Specify dates as mm/dd/yy
- B. Specify date parts as a number of days, months or years
- C. Add, subtract and compare dates of date parts
- D. Many functions work with dates or date parts

7. Calculation Features:

- A. Automatic or manual:
 - Calculates until convergence is achieved

8. Data Exchange:

- A. Move data and models between LisaCalc documents
- B. Move data and text into LisaGraph and LisaWrite

9. Special Features:

- A. "Protection" guards cells from being changed
- B. Circle Missing Values: cells that are referenced in a formula but do not contain valid data are highlighted
- C. Up to 6 vertical or horizontal splits of the window

10. Features:

- A. Undo function: cancels effects of last operation
- B. Revert To Previous Version: undoes all changes made to the document since it was last saved
- C. Display more than one document on the screen at the same time
- D. Horizontal and vertical scrolling

11. Typestyles:

- A. Variety of sizes available

12. Printing:

- A. "What you see is what you get" fidelity
- B. Fit as many as 132 columns on an 8 1/2 x 11-inch page
- C. Automatic or manual page breaks
- D. Print formulas or values
- E. Print in horizontal or vertical formats
- F. Print one or multiple copies
- G. Print whole drawing or selected pages
- H. Background printing enables you to print one or more documents while working on another
- I. Works with the following printers:
 - a. Apple Dot Matrix Printer
 - b. Apple Imagewriter: normal or wide carriage
NOTE: Only version 3.1 of the Office System makes full use of the wide-carriage ImageWriter, letting you print on 14" x 11" paper.
 - c. Apple Daisy Wheel Printer
 - d. Canon Ink Jet Printer

13. Documentation: Reference guide which includes a tutorial.

Macintosh 68000 Development System: Specs (Discontinued)

Revised: 9/24/93
Security: Everyone

Macintosh 68000 Development System: Specs (Discontinued)

=====

I. Programming Tools:

A. Mouse-based 68000 Macro Assembler

B. Editor: window-based, can examine and modify any text file, such as BASIC, MacWrite, C, as well as assembly source files

C. Linker

-- Strips out dead code for creating smaller applications

D. Debugger:

-- Window-based

E. Utilities: for manipulating icons, fonts and resources

F. Executive Processor

-- Automates editing, assembler, and linker functions

G. System definition files

-- Symbolically references ROM routines and data structures

H. Resource Compiler

-- Defines application-specific resources

II. Capacity:

A. Editor: file sizes limited only by disk space

III. Special Features:

A. Symbolic debugger: can be driven by a second Macintosh

- A significant benefit when the machine is being debugged since the program uses less space (Debugging Cable included).

- Debugger support for all 128K ROM calls.

B. Multiple windows display memory contents in various formats including instruction and symbolic disassembly

C. Macintosh toolbox and operating system trap calls are fully supported with macros and equate files

D. Editor:

- handles multiple files concurrently
- supports Undo and up to 9 Windows
- supports up to 9 Windows

E. Fully supports all ToolBox ROM calls.

F. Full support for HFS

- A Path Manager allows users to customize the way MDS applications search for files in HFS folders.

G. New equate and trap files which allow full access to the 128K ROM found in the Macintosh Plus and the Macintosh 512K enhanced (described in the recently published Inside Macintosh Volume IV).

IV. Package:

1. Development System Diskettes (single-sided)
2. User's Manual and Update
3. Programmer's Reference Manual
4. Debugging cable

V. Notes:

MDS 2.0 software is shipped on three single-sided Macintosh disks and will work on any Macintosh or Macintosh XL with at least 512K of RAM. Macintosh 128K owners who do not choose to get a memory upgrade can continue to use MDS 1.0.

MDS is now available from Consulair Corp.

The Macintosh 68000 Development System can be used in conjunction with "Inside Macintosh," a comprehensive technical description of the Macintosh ROM, user-interface considerations, and programming guidelines available from Addison-Wesley.

Okidata Microline 92A printer: Using it with a IIC

Revised: 7/9/85
Security: Everyone

Okidata Microline 92A printer: Using it with a IIC

=====

Before you attempt to use an Okidata Microline 92A printer with an Apple IIC, be aware that the configuration of the printer at shipment is such that the Apple IIC is initially unable to recognize whether the printer is busy. In other words, if you attempt to send text to the printer as it arrives from the factory, all text from your Apple IIC will indeed be sent, but only the text that first fills the printer buffer will actually be printed (about 2K). The remaining text will be lost.

This problem stems from the fact that the printer sends a "Supervisory Send Data (SSD)" signal when it needs to tell the Apple IIC to stop sending data--usually when the printer buffer is full and needs to be emptied before it can receive any more. If the IIC doesn't recognize that SSD signal and stop sending data, that data is lost. And, in fact, the IIC DOES ignore the SSD signal: it's used to looking at the "Data Terminal Ready" (DTR) signal to determine when and when not to send data. The Okidata printer, however, only uses the DTR signal to tell the Apple IIC when it's not on-line, when its power is off, or when it's out of paper--not when it's busy.

The solution to this problem is quite straightforward: simply connect the "busy signal" of the printer to the DTR signal of the IIC by making sure that "SP1" and "SP2" on the serial interface card in the rear inside of the printer are both set to SIDE B. (They are connected to the two leftmost pins of the connector.) This procedure switches the two signals so that the printer will operate correctly with the IIC. For further details, please refer to the Okidata manual, p. A-17, under 'Jumper Plug Functions'.

NOTE: To further enhance the printing capabilities of the printer, we suggest that you set the interface protocol on the serial card in the printer to "Printer Ready/Busy" (Centronics Unblocked) (SW9=OFF, SW10=OFF, SW11=ON). Doing so allows the IIC to access the 2K buffer in the printer, allowing the printer to print faster than if you used the "Printer Ready/Busy" (OKI Simplex Busy) protocol. When using the Centronics Unblocked protocol, there will be times when the printer will temporarily stop to fill its buffer with text before continuing printing. This is normal.

--Serial Interface Settings:

No changes need to be made to the Serial Interface settings. The defaults work perfectly.

--AppleWorks Printer Setting:

Printer codes for utilizing the features of this printer are as follows:

4 characters per inch	---->	CTRL-_
10 characters per inch	---->	CTRL-^
12 characters per inch	---->	CTRL-
17 characters per inch	---->	CTRL-]

6 lines per inch	---->	ESC-6
8 lines per inch	---->	ESC-8

Boldface Begin	---->	ESC-T
Boldface End	---->	ESC-I

Subscript Begin	---->	ESC-L
Subscript End	---->	ESC-M

Superscript Begin	---->	ESC-J
Superscript End	---->	ESC-K

Underline Begin	---->	ESC-C
Underline End	---->	ESC-D

Correspondence Quality	---->	ESC-1	These two codes may have to be exchanged for Bold Begin/End
Data Processing Quality	--->	ESC-0

Epson FX-80 printer: Using it with a IIC

Revised: 7/9/85
Security: Everyone

Epson FX-80 printer: Using it with a IIC

=====

Most Epson FX-80 printers are built to operate with parallel computers. In order for them to work with the Apple IIC, the Epson Intelligent Serial Interface Card must be installed in the printer. The default setting for baud rate on this card, however--19200 BPS--needs to be changed to 9600 BPS in order for the printer to communicate with the IIC.

Set the following switches on the SIC as shown below in order to change the card's baud rate to 9600 BPS:

SW1-5 = OFF
SW1-6 = ON
SW1-7 = OFF
SW1-8 = OFF

Apple II: Transferring Data to a Macintosh Without AFE (10/94)

Revised: 10/18/94
Security: Everyone

Apple II: Transferring Data to a Macintosh Without AFE (10/94)

Article Created: 09 July 1985
Article Reviewed/Updated: 18 October 1994

TOPIC -----

How can I transfer information from my Apple II to my Macintosh without Apple File Exchange or Macintosh PC Exchange?

DISCUSSION -----

The best way to transfer data files from an Apple IIe to a Macintosh, and vice versa, is to use Apple File Exchange (AFE) or Macintosh PC Exchange. However, AFE requires that the Apple II data first be put on 3.5" disks. If that isn't feasible, there's another way:

1. Connect the serial ports of the two computers, using a Macintosh Imagewriter cable. In the case of the Apple IIe, the connection is made a Super Serial Card. The Apple IIc, Apple IIgs, and all Macintosh computers have built-in serial ports.
2. Point the jumper block on the Super Serial Card to MODEM.
3. Run Access II (or comparable application) on the Apple II and MacTerminal (or comparable application) on the Macintosh.
4. Set one system up to send a file and the other to receive a file. Make sure both systems are set for the same baud rate, data bits, and so forth.

Sample Software Setup:

Apple II

TTY Mode
Line Feed + Carriage Return
8 Bits

Macintosh

TTY Mode
New Line
8 Bits

Xon/Xoff
9600 Baud
No Parity
Half Duplex
Normal Video
Wraparound

Xon/Xoff
9600 Baud
No Parity
Local Echo
Underline Cursor
Wraparound
80 Column
OnLine
Auto repeat
Modem Connection

Communications Interface Card: Initializing with POKEs (11/96)

Revised: 11/21/96
Security: Everyone

Communications Interface Card: Initializing with POKEs (11/96)

Article Created: 09 July 85
Article Reviewed/Updated: 18 November 1996

TOPIC -----

The following describes the use of POKEs instead of PR# or IN# commands to initialize the Communications Interface.

DISCUSSION -----

Neither the PR# nor IN# commands in Applesoft and Integer Basic initialize the Communications Interface. This situation can cause problems if you need to modify the parameters of the interface for your application.

The ROM on the Communications Interface card, upon receiving the first character, sets all parameters to their default settings. So, after you've POKEd the parameter you want, the first character you send will cause the ROM to overwrite all the parameter locations just set up.

To correct this, send a character through the card and then change the parameter locations by means of the following POKEs. (Please refer to the Communications Interface Card manual for additional information about what each POKE does.)

Replace all occurrences of "s" in the BASIC program below with the number of the slot that the Communications Interface Card is plugged into.

```
10 POKE 1784+s,32      lower case, page 17
20 POKE 1912+s,0       video echo, page 17
30 POKE 2040+s,17      STAT, page 27
40 POKE -16242+s*16,3   reset ACIA, page 27
50 POKE -16242+s*16,17 status, page 27
```

The next list of POKEs will replace the PR# and IN# commands. You must use these POKEs in order to benefit from the previous POKEs. You should use the CALL 1002 if you will be doing DOS commands while the interface is enabled.

..TIL01180-Communications_Interface_Card-Initializing_with_POKEs_11-96.pdf

If speed is of the essence, don't use CALL 1002 until after the data transfer is complete, since DOS slows down I/O. These POKEs must all be on one command line separated by colons to work in command mode. They can have separate line numbers in a program.

```
60 POKE 54,5          PR#s
70 POKE 55,192+s
80 POKE 56,7          IN#s
90 POKE 57,192+s
100 CALL 1002
```

The normal way to reset the I/O to the Apple video and keyboard from within a program is:

```
900 D$ = CHR$ (4): REM CTRL-D
910 PRINT D$;"PR#0"
920 PRINT D$;"IN#0"
```

This will only work after a PRINT and will be ignored after a GET or PRINT terminated with a comma or semicolon. To avoid having to do an extra PRINT, use:

```
900 CALL -375 : REM THIS IS IN#0
910 CALL -365 : REM THIS IS PR#0
920 CALL 1002 : REM THIS RECONNECTS DOS
```

Video Echo

Do not allow video echoing while sending information to the interface. Your program or variables may be damaged if video echo is not disabled for lines more than 40 characters long.

NEC Pinwriter P2 printer: Using it with a IIfc (10/94)

Revised: 10/18/94
Security: Everyone

NEC Pinwriter P2 printer: Using it with a IIfc (10/94)

Article Created: 09 July 1985
Article Reviewed/Updated: 18 October 1994

TOPIC -----

Is it possible to use an NEC Pinwriter P2 printer with my Apple IIfc?

DISCUSSION -----

The NEC printer works well with the Apple IIfc. Connecting it is quite simple; one minor adjustment may need to be made, though, to the printer as it comes from the factory. Switch 2-6 of the dip switches located inside the printer (underneath the printhead) should be set in the ON position for 7-bit data, which allows the printer to function correctly with AppleWorks and BASIC and most other programs.

NOTE: If you plan on using the graphic capabilities of this printer, you may have to change the 2-6 switch back to the OFF position for an 8-bit data format.

The recommended switch settings for most applications are:

SW1-1 = OFF	SW2-1 = OFF
SW1-2 = OFF	SW2-2 = OFF
SW1-3 = OFF	SW2-3 = OFF
SW1-4 = OFF	SW2-4 = OFF
SW1-5 = ON	SW2-5 = ON
SW1-6 = ON	SW2-6 = ON
SW1-7 = OFF	SW2-7 = ON
SW1-8 = OFF	SW2-8 = OFF

The dip switches on the P2/P3-7 Serial Interface (Model 6307) should be as follows:

SW1-1 = OFF	SW2-1 = ON SW3-1 = ON
SW1-2 = ON	SW2-2 = OFF SW3-2 = OFF

SW1-3 = OFF	SW2-3 = ON SW3-3 = OFF
SW1-4 = ON	SW2-4 = OFF SW3-4 = OFF
SW1-5 = OFF	SW2-5 = OFF SW3-5 = OFF
SW1-6 = ON	SW2-6 = OFF SW3-6 = OFF
SW1-7 = OFF	SW2-7 = OFF SW3-7 = ON
SW1-8 = OFF	SW2-8 = OFF SW3-8 = OFF

AppleWorks Printer Setting

The NEC printer is fully compatible with AppleWorks. When you add the printer as custom printer in the Printer Information section of AppleWorks, the print codes should be as follows:

5 CPI = CTRL-R ESC-h	(CPI = Characters per inch)
6 CPI = CTRL-R ESC-e	
8 CPI = CTRL-R ESC-Q	
10 CPI = CTRL-T ESC-h	
12 CPI = CTRL-T ESC-e	
17 CPI = CTRL-T ESC-Q	

Bold Begin = ESC-!
Bold End = ESC-"

Underline Begin = ESC-X
Underline End = ESC-Y

Subscript Begin = ESC-G CTRL-A
Subscript End = ESC-Z

Superscript Begin = ESC-G CTRL-@
Superscript End = ESC-Z

8LPI = ESC-B
6LPI = ESC-A

Set the printer specifications in AppleWorks not to have a Line Feed after every RETURN.

Apple Cluster Controller: Pinouts (10/94)

Revised: 10/18/94
Security: Everyone

Apple Cluster Controller: Pinouts (10/94)

Article Created: 09 July 1985
Article Reviewed/Updated: 18 October 1994

TOPIC -----

What are the pinouts and functions for the Apple Cluster Controller?

DISCUSSION -----

Apple Cluster Controller (ACC):

A. Asynchronous Direct Port Plug (port acts as a modem/DCE)

DB-25				
Connector	Function	Mnemonic	Data/Signal Direction	
1	Ground			
2	Transmit Data	(Tx)	In	
3	Receive Data	(Rx)	Out	
4	Request to Send	(RTS)	In	
5	Clear to Send	(CTS)	Out	
6	Data Set Ready	(DSR)	Out	
7	Ground			
8	Data Carrier Detect	(DCD)	Out	
20	Data Terminal Ready	(DTR)	In	

B. Modem Port Plug (port acts as a terminal/DTE)

DB-25				
Connector	Function	Mnemonic	Data/Signal Direction	
1	Ground			
2	Transmit Data	(Tx)	Out	
3	Receive Data	(Rx)	In	
4	Request to Send	(RTS)	Out	

..TIL01183-Apple_Cluster_Controller-Pinouts_10-94.pdf

5	Clear to Send	(CTS)	In
6	Data Set Ready	(DSR)	In
7	Ground		
8	Data Carrier Detect	(DCD)	In
20	Data Terminal Ready	(DTR)	Out

NOTES:

1. Macintosh XL users: connect the Apple Cluster Controller to port A.
2. If you configure you ACC port with the Modem Port Plug (for DTE) to communicate with any Apple except a Macintosh, use Modem Eliminator cable part #590-0166-A in line with your Apple serial cable part #590-0037.
3. To connect a Macintosh to a port configured with the Modem Plug, construct your own cable as Apple doesn't manufacture one. Alternatively, use the Asynchronous Direct Plug and the Macintosh printer cable part #590-0169.

ProFile: Formatting Compatibility (10/94)

=====

Article Created: 09 July 1985
Article Reviewed/Updated: 18 October 1994

TOPIC -----

For what operating systems is the Apple ProFile compatible?

DISCUSSION -----

ProFiles can be formatted for two main types of operating systems:

1. the Lisa Operating System for the Lisa

or

2. ProDOS for the Apple II, and SOS for the Apple III.

ProFiles are formatted at the factory with the Apple III SOS format and contain the Apple III System Utilities program. This format is completely compatible with the Apple II ProDOS format, and so can be used on either the Apple II or Apple III; additionally, these ProFiles can be used without difficulty on the Macintosh XL (running Lisa or Macintosh software).

Once a ProFile has been formatted by Lisa software, it will not be able to work any longer on an Apple II or III.

ProFiles don't need any special software to function with these systems other than the respective system formatters which accompany each system's operating system utilities, regardless of what system it was used on previously.

NOTES:

1. The Pascal ProFile Manager will not format a ProFile; the ProFile must already be formatted with ProDOS.
2. If you're unable to initialize a Profile for use with an Apple II or

..TIL01185-ProFile-Formatting_Compatibility_10-94_(TA29187).pdf

Apple III after it's been used with a Macintosh XL, check with a Level II service center: the ProFile may need reformatting.

Apple II and II+: Memory typically available to users

Revised: 7/9/85
Security: Everyone

Apple II and II+: Memory typically available to users

=====

After startup, Applesoft's FRE(0) statement reports the same amount, 48K, of free memory in the II Plus, the Apple IIe with 64K, and the Apple IIe or IIC with 128K. No matter how much the maximum memory of the CPU is, you will never have more than 48K of memory available to you, since the microprocessor lets BASIC have DIRECT access to only 48K in Apple II family computers with memory configurations equal to or greater than 48K.

This discrepancy stems both from the microprocessor's memory limit and from the demand placed on the system by the software. The Apple's 6502 microprocessor can directly access only 64K of memory (address 65536 (\$FFFF)). Some of the 64K has to be loaded with system software: the monitor, Applesoft, I/O, stacks, keyboard, vectors, and text display. The Apple's system monitor and Applesoft language routines reside in upper memory from \$D000 to \$FFFF. I/O ROM locations span from \$C000 to \$CFFF. Finally, the system uses \$0000 to \$07FF for its stack, keyboard input, system vectors and text display. This amount of software leaves you with 47103 bytes (the memory space between \$0800 and \$BFFF) that you can directly access through BASIC.

The user can then decide to give more of this memory to an operating system and high resolution graphics. For example, if you use DOS 3.3, you relinquish approximately 10.5K, the memory space from \$9600 to \$BFFF. Similarly, high resolution graphics page 1 or 2 takes another 8K for each page.

--> Adding more memory for the user

Adding memory allows you to load operating systems not dependent on BASIC; it also lets you take advantage of the full 64K from assembly language programs. Apple II and II+ users can add 16K to a 48K configuration if they install a RAM card in slot #0.

In the IIe, this 16K "RAM card" is built onto the motherboard and is addressed in the same way as the card in the II and II+; that's why there's no slot #0 on the Apple IIe. This additional 16K actually overlays the upper 16K of memory only by bank-switching between the ROM and RAM.

AppleWorks: Using it on the Apple II and Apple II Plus

=====

Videx makes 80-column boards and patch program disks that allow Appleworks to operate on an Apple II or II Plus.

A Videx card gives a normal Apple II or Apple II Plus the ability to run AppleWorks. The AppleWorks diskettes must also be modified with a special patch program in order to run on the Apple II or II Plus.

There are some technical considerations, though:

- a. The user must have purchased the Videx Ultraterm Card or the Videoterm Card with the Inverse Option chip.
- b. The shift key modification must also be in place; if it isn't, you can perform the modification yourself by referring to the manual.
- c. The program requires AppleWorks 1.3 to utilize the Apple RAM card. Titan and Legend RAM cards are supported with AppleWorks versions 1.1 and 1.2.

Applied Engineering, best known for its RamWorks board for the Apple IIe, also makes "RamFactor", a memory board for the Apple II, Apple II Plus, IIe, and Apple IIGS.

RamFactor comes with a set of patch disks for AppleWorks versions 1.2 and 1.3 and another set for 2.0. Patch disks from Videx are not required.

Technical requirements for an Apple II Plus are:

- a. 64K main memory in either:
 1. 48K + 16K language cardor

2. Applied Engineering Transwarp Accelerator

- b. 80 column card with inverse video capability
- c. Shift key wire from keyboard to main board (a common modification)
- d. RamFactor board with at least 256K (minimum configuration)
- e. One or more disk drives.

Such an Apple II Plus system has no trouble running AppleWorks 1.3.

The following key substitutions apply:

Apple II Plus	AppleWorks
Escape	Open Apple
Control-J	Up
Control-K	Down

UniDisk: Specifications (Discontinued)

=====

This article last reviewed: 9 July 1985

I. Technical Specifications

1. Recording Media

- a. Disk diameter: 5.25 inches
- b. Recording surfaces: 1
- c. Tracks per surface: 35

2. Capacities

- a. Formatted data capacity: 140 kilobytes, 16 sectors
 - 1. ProDOS: 137 KB
 - 2. Pascal: 137 KB
 - 3. DOS 3.3: 124 KB

3. Characteristics

- a. Seek/settle time (track to track): 30 milliseconds maximum
- b. Drive-motor start time: 0.5 seconds maximum
- c. Mechanism same as drive for Duodisk, IIc drive, and Disk IIc

4. Power Consumption

- a. +12 VDC with a tolerance of 0.6 V (plus or minus)
 - 1. Maximum ripple 120mV peak to peak
 - 2. 0.8 A typical
 - 3. 1.6 A maximum
- b. -12 VDC with a tolerance of 0.6 V (plus or minus)
 - 1. Maximum ripple 120mV peak to peak
 - 2. 0.01 A typical
 - 3. 0.02 A maximum
- c. +5 VDC with a tolerance of 0.25 V (plus or minus)
 - 1. Maximum ripple 120mV peak to peak

2. 0.2 A typical
3. 0.4 A maximum

5. Head positioning: Adjusted to a tolerance of 0.002 inches (plus or minus) maximum deviation from ideal on track

6. Environmental Characteristics

- a. Operating temperature:
 1. 50 to 115 degrees Fahrenheit
 2. 10 to 46 degrees Celsius
- b. Operating humidity: 20% to 80% (noncondensing)
- c. Maximum wet bulb:
 1. 85 degrees Fahrenheit
 2. 29.4 degrees Celsius

7. Drive Dimensions

	inches	millimeters
a. Length	8.50	216.0
b. Width	6.37	162.0
c. Height	3.13	79.6

	pounds	kilograms
d. Weight	4.62	2.1

8. Connection

For each controller card connected to a Unidisk, a second Unidisk drive can be "daisy chained" or connected to the back of the first.

II. System Configuration

1. Controller Card and

- a. Apple II
- b. Apple II Plus
- c. Apple IIe
- d. Apple IIGS

III. Package

1. Order number:
 - a. A9M0104: Unidisk drive with controller card
 - b. A9M0105: Unidisk drive

Extended 80-Column Text/AppleColor Card: Specs (11/96)

Article Created: 09 July 1985
Article Reviewed/Updated: 14 November 1996

TOPIC -----

This article provides technical specifications for the Extended 80 column/Text card for the Apple IIe. This product has been discontinued and is no longer available from Apple.

DISCUSSION -----

Technical Specifications
=====

Output

The card has a DB-15 connector which is compatible with the cable supplied with AppleColor Monitor 100.

Signals available support XRGB and negative sync. For 16 Apple colors: A summing network, like that built into the Apple Color Monitor 100, must follow to obtain Apple colors

Without summing network, colors may be limited to primary and secondary, differentiated only in intensity.

+5 volts DC for powering adapter devices for other monitors; 4 text colors: amber, green, blue, or white, and inverse and flashing text in white only are all supported.

Switches

For color display of text.

Software compatibility

IIf software included for BASIC and Double high-resolution graphics modes. Soft switches are the same as those on the Extended 80-Column Text Card.

Composite video compatibility

Composite video connector cannot be used simultaneously with RGB video connector, it must be used in lieu of an RGB monitor.

A diskette of machine-language driver software included with card supports the following video modes:16 colors: 140 by 192, 2 colors: 560 by 192, 16 colors: 140 by 192 with 80-column text

The card provides compatibility with composite video output, RGB video output and supports 15 Ampersand routines usable from Applesoft BASIC.

Memory

64K on card total available memory after installation 128K

System Requirements

Apple IIe with available Auxiliary Connector

High-resolution color video display such as the AppleColor Monitor 100 or other RGB (Red, Green, Blue) color monitors.

Package

-
1. Card: Extended 80-Column Text/AppleColor
 2. Diskette: DOS 3.3 and ProDOS double high-resolution driver software with complete demonstration software.
 3. Manual: Extended 80-Column Text/AppleColor Card.
 4. Cable assembly with DB-15 connector
 5. Cards: Warranty and product registration

High-Density Diskettes: Which Drives Support Them (10/94)

=====

Article Created: 16 November 1987
Article Reviewed/Updated: 18 October 1994

TOPIC -----

In what Apple floppy disk drives can I use high-density diskettes?

DISCUSSION -----

High-density diskettes (1.44MB only) are suitable for use in Apple SuperDrive (formerly Apple FDHD).

High-density diskettes are NOT suitable for use with:

- Macintosh 400K drives
- Macintosh 800K drives
- Apple II 3.5-inch drives

High-density diskettes are physically different from double-density diskettes and are tested to a different specification. The coating on a high-density diskette is thinner for higher data-packing density. Use in 400K or 800K drives is unreliable and can cause data loss.

Macintosh: Directory size

Revised: 7/17/85
Security: Everyone

Macintosh: Directory size

=====

Since the Macintosh's directory uses variable amounts of storage space to maintain file names, it's possible to run out of "disk space" to store file names when there is plenty of storage space for the data itself. In fact, you can run out of directory space just by changing the name of a file to a longer one.

To free up all available storage space for your files: 1) shorten the names of your files as much as possible, and then 2) move all documents to another diskette, then erase the original diskette and move the documents back onto it.

NOTE: Some third-party applications don't handle this situation in a very friendly manner: the system may bomb due to the lack of directory space and not inform you why it bombed. If you suspect that lack of directory space may be your problem--that is, if your disk is fairly full--perform the two steps described above before you assume the problem is something else.

Macintosh 400K Disk Drive: Specifications (Discontinued)

=====

This article last reviewed: 17 July 1985

I. Capacity

A. Unformatted disk space	437.5 K bytes
B. Formatted disk space	409.6 K bytes
C. Burst TRANSFER RATE	489.6 K bits per second

II. Access time

milliseconds

A. Track to track	15
B. Average*	415
C. Settling time	15
D. Head load time	60
E. Average latency	50

* Average access time = $1/3 \times (\text{Track Nos.}) \times (\text{Track to track}) + (\text{Settling Time})$

III. Functional

A. Rotational speed(s)	394, 429, 472, 525, 590 RPM
B. Recording density (inside track)	7610 BPI
C. Track density	135 TPI
D. Cylinders	80
E. Tracks	80
F. R/W heads	1
G. Encoding method	APPLE GCR
H. Component life	5 years
I. Media life	over 3 million passes track
H. Diskette Interchange	20,000 times minimum
J. Soft Read Error	1 per billion bits read
K. Hard Read Error	1 per trillion bits read
L. Seek Error	1 per billion seeks

IV. Heat Dissipation

A. Operating mode (head load)	7.5 W
B. Standby mode	3.3 W

V. Physical Dimensions

	inches	millimeters
A. Height	2.0	51
B. Width	4.0	102
C. Depth	5.1	130

	pounds	grams
D. Weight	1.5	65

VI. Power requirements

A. +12 Volts DC +/-5%	0.1V p-p	Max Ripple 0.1 V (max)
B. +5 Volts DC +/-5%	0.05V p-p	Max Ripple 0.1 V (max)

VII. Environmental limits (Operating)

	degrees Fahrenheit	Celsius
A. Temperature	40-140	5-45
B. Humidity	20% to 80% relative humidity (no condensation)

Lisa Office System 3.1: Installing with BASIC Workshop 3.0

=====

BASIC Workshop 3.0 is fully compatible with Lisa Office System Release 3.1.

If you wish to install the Office System 3.1 and BASIC Workshop 3.0:

1. Back up your documents currently stored on the hard disk.
2. Install the Office System 3.1. Follow the steps in Chapter 6 of the Lisa Office System manual. Select Erase, then select Share if you wish to share the hard disk with Macintosh software.
3. Install BASIC Workshop 3.0. Follow the steps in Chapter 1 of the Workshop manual. Select Don't Erase when prompted.

NOTE: Running StartUpdate is not required for the BASIC Workshop; as a matter of fact, running it will cause an error to be displayed. Although you must run StartUpdate to update Pascal 3.0, doing so will not harm BASIC.

Macintosh Pascal: Variable-reference parameter

Revised: 7/17/85
Security: Everyone

Macintosh Pascal: Variable-reference parameter

=====

The variable-reference parameter in a Macintosh Pascal RESET, REWRITE or OPEN command is a reference to the file being accessed. The syntax of these commands is:

```
RESET(F,P)
REWRITE(F,P)
OPEN(F,P)
```

where F is the variable-reference and P is the pathname of the file being accessed. For example, the command `Open(TheFile,'Volume1:Inventory')` opens the file 'Inventory' on the diskette named 'Volume 1'. That command also sets the variable-reference 'TheFile' so that it refers to that particular file, 'Volume1:Inventory'. Thereafter, commands such as `Get(TheFile)`, `Put(Thefile)` and `Close(TheFile)` all access this file, 'Volume1:Inventory'.

Apple IIGS: Installing Pascal on the RAM Disk

=====

This article last reviewed: 17 November 1987

To install Pascal on the Apple IIGS RAM disk, so that the system can start up from Pascal:

1. Enter the Control Panel and set the size of the RAM disk. (800K is suggested.)
2. Turn off the power to the Apple IIGS, then on again. This clears the RAM disk and resets its size.
3. Start up Pascal.
4. Use the FORMATTER program to format the RAM disk for Pascal. (RAM disk is device #5.)
5. Use the Filer to copy all files over to the RAM disk.
6. Go back to the Command level, and exit Pascal by pressing Q.
7. Quickly press Open-Apple, Control, and Escape all at once to enter the Classic Desk Accessories menu. This must be done before the Apple IIGS has a chance to start up from a floppy drive.
8. Enter the "Slots" section of the Control Panel, and select the RAM Disk as the start-up device.
9. Exit the Control Panel and Classic Desk Accessories menu. The Apple IIGS will continue its start-up procedure, restarting from the RAM Disk. And it will start up from the RAM disk every time -- until you either re-format the RAM Disk or turn off the computer.

Apple II Peripheral Cards: How Pascal identifies (2/97)

Revised: 2/12/97
Security: Everyone

Apple II Peripheral Cards: How Pascal identifies (2/97)

=====

Apple II Peripheral Cards: How Pascal identifies (2/97)

Article Created: 27 July 1985
Article Reviewed/Updated: 12 Feb 1997

TOPIC -----

This article discusses how Pascal v1.1 identifies peripheral cards.

DISCUSSION -----

Pascal 1.1 uses four firmware bytes to identify the peripheral card. Both the identifying bytes and the branch table are near the beginning of the \$Cs00 ROM space (where s = slot). The identifiers are listed in Table A-2.

Address	Value
\$Cs05	\$38 (like the old Serial Interface Card)
\$Cs07	\$18 (like the old Serial Interface Card)
\$Cs0B	\$01 (like Generic Signature of new FW cards)
\$Cs0C	\$ci (like Device Signature; see below)

Table A-2. Bytes Used for Device Indentification

The first digit, c, of the Device Signature byte indentifies the device class as listed in Table A-3.

Digit	Class
\$0	reserved
\$1	printer
\$2	joystick or other X-Y input device
\$3	serial or parallel I/O card

\$4	modem
\$5	sound or speech device
\$6	clock
\$7	mass storage device
\$8	80-column card
\$9	network or bus interface
\$A	special purpose (none of the above)
\$B-F	reserved for future expansion

Table A-3. Device Class Digit

The second digit, i, of the Device Signature byte is a unique identifier for the card, assigned by Apple Developer Technical Support. For example, in the Device Signature of the SSC--\$31--the 3 signifies that the device is a serial or parallel I/O card; the 1 is Apple Developer Technical Support's unique identifier for that card.

Security: Everyone

SANE: Technical product description (1 of 2) (10/94)

=====
Article Created: 22 July 1985
Article Reviewed/Updated: 18 October 1994

TOPIC -----

This article describes the Standard Apple Numeric Environment (SANE).

DISCUSSION -----

I. Introduction

Apple supports SANE on several current products and plans to support SANE on future products. SANE gives you access to numeric facilities unavailable on almost any computer of the early 1980's--from microcomputers to extremely fast, extremely expensive supercomputers. The core features of SANE are not exclusive to Apple; rather they are taken from Draft 10.0 of Standard 754 Binary Floating-Point Arithmetic [10] as proposed to the Institute of Electrical and Electronics Engineers (IEEE). Thus SANE is one of the first widely available products with the arithmetic capabilities destined to be found on the computers of the mid-1980's and beyond.

The IEEE Standard specifies standardized data types, arithmetic, and conversions, along with tools for handling limitations and exceptions, that are sufficient for numeric applications. SANE supports all requirements of the IEEE Standard. SANE goes beyond the specifications of the Standard by including a data type designed for accounting applications and by including several high-quality library functions for financial and scientific calculations.

IEEE arithmetic was specifically designed to provide advanced features for numerical analysts without imposing an extra burden on casual users. (This is an admirable but rarely attainable goal: text editors and word processors, for example, typically suffer increased complexity with added features, meaning more hurdles for the novice to clear before completing even the simplest tasks.) The independence of elementary and advanced features of the IEEE arithmetic was carried over to SANE.

II. Data Types:

SANE provides three APPLICATION data types (single, double, and comp) and the ARITHMETIC type (extended). Single, double, and extended store floating-point values and comp stores integral values.

The EXTENDED type is called the arithmetic type because, to make expression evaluation simpler and more accurate, SANE performs all arithmetic operations in extended precision and delivers arithmetic results to the extended type. SINGLE, DOUBLE, and COMP can be thought of as space-saving storage types for the extended-precision arithmetic. (In this article, we shall use the term EXTENDED PRECISION to denote both the extended precision and the extended range of the extended type.)

All values representable in single, double, and comp (as well as 16-bit and 32-bit integers) can be represented exactly in extended. Thus values can be moved from any of these types to the extended type and back without any loss of information.

SANE: Technical Product Description (2 of 2) (10/94)

=====
Article Created: 22 July 1985
Article Reviewed/Updated: 18 October 1994

TOPIC -----

This article describes the Standard Apple Numeric Environment (SANE).

DISCUSSION -----

III. Choosing a Data Type:

Typically, picking a data type requires that you determine the trade-offs between:

- * fixed - or floating-point form
- * precision
- * range
- * memory usage
- * speed

The precision, range, and memory usage for each SANE data type are shown in the table of SANE types below. Effects of the data types on performance (speed) vary among the implementations of SANE.

Most accounting applications require a counting type that counts things (pennies, dollars, widgets) exactly. Accounting applications can be implemented by representing money values as integral numbers of cents or mils, which can be stored exactly in the storage format of the COMP (for computational) type. The sum, difference, or product of any two comp values is exact if the magnitude of the result does not exceed $2^{63} - 1$ (that is, 223,372,036,854,775,807). This number is larger than the U.S national debt expressed in Argentine pesos. In addition, comp values (such as the results of accounting computations) can be mixed with extended values in floating-point computations (such as compound interest).

Arithmetic with comp-type variables, like all SANE arithmetic, is done

internally using extended-precision arithmetic. There is no loss of precision, as conversion from comp to extended is always exact. Space can be saved by storing numbers in the comp type, which is 20 percent shorter than extended. Non-accounting applications will normally be better served by floating-point data formats.

IV. Values Represented:

The floating-point storage formats (single, double and extended) provide binary encodings of a SIGN (+ or -), an EXPONENT, and a SIGNIFICAND. A represented number has the value

$$\pm \text{significand} \times 2^{\text{exponent}}$$

where the significand has a single bit to the left of the binary point (that is, $0 \leq \text{significand} < 2$).

V. Range and Precision of SANE Types:

The table below describes the range and precision of the numeric data types supported by SANE. Decimal ranges are expressed as chopped two-digit decimal representations of the exact binary values.

SANE DATA TYPES				
TYPE CLASS	APPLICATION			ARITHMETIC
Type Identifier	Single	Double	Comp	Extended
Size (bytes:bits)	4:32	8:64	8:64	10:80
Binary exponent range				
Minimum	-126	-1022	---	-16383
Maximum	127	1023	---	16383
Significand precision				
Bits	24	53	63	64
Decimal digits	7-8	15-16	18-19	19-20
Decimal range (approximate)				
Min negative	-3.4E+38	-1.7E+308	9.2E18	-1.1E+4932
Max neg norm	-1.2E-38	-2.3E-308		-1.7E-4932
Max neg denorm	-1.5E-45	-5.0E-324		-1.9E-4591
Min pos denorm	1.5E-45	5.0E-324		1.9E-4591
Min pos norm	1.2E-38	2.3E-308		1.7E-4932
Max positive	3.4E+38	1.7E+308	9.2E18	1.1E+4932
Infinitive	Yes	Yes	No	Yes
NaNs	Yes	Yes	Yes	Yes

Usually numbers are stored in a normalized form, to afford maximum precision for a given significant width. Maximum precision is achieved if the high order bit in the significand is 1 (that is, $1 \leq \text{significand} < 2$).

Security: Everyone

ProDOS Assembler Tools: Technical product description

=====

The ProDOS Assembler Tools is designed for programmers who want to write assembly-language programs for the Apple II, II+, IIC, IIE or IIE enhanced. All five of these computers are based on the 6502 microprocessor, whose command set is supported by the Assembler Tools. Before you attempt using the Tools, we recommend that you be fairly familiar with BASIC or Pascal on the Apple computer system and that you read one or more books on 6502 assembly-language programming.

The ProDOS Assembler Tools include four programming tools that will help you create and execute assembly-language programs to run on any Apple II computer. These tools are the Editor, the Assembler, the Bugbyter debugger, and the Relocating Loader:

- Use the EDITOR to create and modify program source files and to store them on disk. You can also use the Editor to edit ProDOS EXEC files and BASIC program source files.
- Use the ASSEMBLER to generate an executable program.
- Use the BUGBYTER debugger to test and verify the execution of your programs. Also use the Bugbyter to help you locate and fix any errors that might creep into your programs.

Further details can be found in the ProDOS Assembler Tools User's Manual.

Apple IIGS: Graphics Modes (10/94)

Revised: 10/18/94
Security: Everyone

Apple IIGS: Graphics Modes (10/94)

=====

Article Created: 23 October 1986
Article Reviewed/Updated: 18 October 1994

TOPIC -----

What are the available graphics modes available on the Apple IIgs?

DISCUSSION -----

The Apple IIGS can perform graphics under a number of different types of graphics displays: Lo-res and Hi-res modes found on all Apple II systems, the double Hi-res mode available on the Apple IIe and IIc, and new Super Hi-Res modes.

Both Lo-res and Hi-res modes are unchanged from the Apple II, and the manual "Applesoft on the IIGS" shows the commands for using those modes. The IIGS ROM doesn't have routines for the use of double Hi-res graphics; a programmer must add assembler routines that will properly draw lines, locate points, etc., in double Hi-res mode. Commercially available packages include these routines.

Only on the Apple IIGS performs in Super Hi-Res graphics modes with a resolution of 320 X 200 or 640 X 200. Using 320 X 200 mode permits a full 16 colors per line. 640 X 200 mode can also use 16 colors per line, but each pixel is limited to a choice of 4 of the 16 colors. Both modes are supported by the Apple IIGS QuickDraw II tools. To make programming easier, screen memory is mapped contiguously in Super Hi-Res mode.

320 X 200 Super Hi-Res mode

Each line of pixels in 320 mode is associated with a table of 16 entries that correspond to the 16 colors to be shown on that line. Each entry represents one of the possible 4096 colors available on the Apple IIGS. There may be as many as 16 color tables defined, permitting 256 colors on the screen at one time.

Within each line, a byte determines two pixels' colors. The high 4 bits of a byte contain a number from 0 to 15, which is used as an offset into the color

table for that line. The pixel mapped to that memory location will have the color found at the appropriate table location. Similarly, the low 4 bits of that byte will determine the color of the adjacent pixel.

Pixels in 320 mode are almost square. The aspect ratio in this mode is 5:6 on an Apple Monochrome Monitor, an AppleColor Monitor, or an Apple RGB Monitor.

640 X 200 Super Hi-Res Mode

640 mode also allows 16 colors per line, but each pixel is limited to one of four colors (this mode is sometimes called Limited 16 Colors). As in 320 mode, each line addresses one of up to 16 color tables. However, each pixel in the line is represented by only 2 bits, so that each byte contains information about 4 pixels.

To represent 4 adjacent pixels, bits 7 and 6 choose from among colors 0 through 3 in the appropriate color palette, bits 5 and 4 choose colors 4 through 7, bits 3 and 2, from colors 8 through 11, and the last two bits choose from colors 12 through 15. Therefore, each pixel can be one of four colors, but there may be a total of 16 colors on each line.

The pixel aspect ratio in 640 mode is 5:12 on an Apple monitor, so that each pixel's height is approximately twice the width.

Color Fill Mode

The Apple IIGS can also use 320 X 200 mode with color fill. If this mode is chosen, the color zero (0) takes on a special meaning. A pixel with color 0 will have the same color as the preceding pixel, so that a series of bytes with value 80 00 00 would all be shown in the color represented by the eighth entry in the color palette. Using 0 to represent no color change limits the selection to only 15 colors per line, but does save time for the programmer.

Apple III and ProFile: Running Them on an Inverter (10/94)

Revised: 10/18/94
Security: Everyone

Apple III and ProFile: Running Them on an Inverter (10/94)

=====

Article Created: 22 July 1985
Article Reviewed/Updated: 18 October 1994

TOPIC -----

Can I run my Apple /// and ProFile on an inverter?

DISCUSSION -----

The Apple III and ProFile may both be run on an inverter that produces either a square or a sinusoidal wave.

The Apple III itself works on an inverter without any problems, as long as the inverter has sufficient current capacity. The Apple III has a switching power supply and will therefore tolerate power fluctuations and line noise without any trouble, as long as it's receiving a minimum of 95 volts.

The ProFile, on the other hand, is somewhat more sensitive to power fluctuations and line noise. If you use your ProFile with an inverter that produces a square wave, take care that:

1. Make sure that the inverter can supply at least 8 amps, since 5 amps is the minimum power required to start up the ProFile.
2. If you wish to use square-wave power, which is by nature quite noisy, use a noise suppression kit so that no unnecessary noise reaches the ProFile power supply and prevents the ProFile from coming Ready. Your noise suppressor must have a minimum capacity of 10 amps.

NOTE:

You can avoid the necessity of noise suppressors by running your ProFile on DC power if you wish. To do so, however, you will need to regulate the +12V from a car battery, as well as generate and regulate +5V and -12V.

Enhanced IIE: What to do When Interrupts Don't Work (10/94)

Revised: 10/18/94
Security: Everyone

Enhanced IIE: What to do When Interrupts Don't Work (10/94)

=====
Article Created: 22 July 1985
Article Reviewed/Updated: 18 October 1994

TOPIC -----

I notice that interrupts no longer function on my Enhanced IIE, is there a workaround?

DISCUSSION -----

Interrupts pass through the 80-column firmware in the Enhanced IIE, and so interrupts will not work if you have no 80-column card installed. There are three ways to solve the problem:

1. Install an 80 column-card
2. Make sure your disk contains ProDOS 1.1.1
3. If neither of the above solutions seem to work, use the BASIC command
POKE 49162,0 to fool your IIE into thinking that it contains an
80-column card.

Apple Daisy Wheel Printer: Compared to Qume Sprint 11 (10/94)

Revised: 10/18/94
Security: Everyone

Apple Daisy Wheel Printer: Compared to Qume Sprint 11 (10/94)

=====

Article Created: 22 July 1985
Article Reviewed/Updated: 18 October 1994

TOPIC -----

Is the Apple Daisy Wheel Printer the same as the Qume Sprint 11?

DISCUSSION -----

The Apple Daisy Wheel Printer (DWP) bears a superficial resemblance to the Qume Sprint 11 Plus. In fact, the Apple DWP is manufactured by Qume to our own custom specifications. As such, there are very few interchangeable parts between the DWP and Qume Sprint 11 Plus.

Perhaps the greatest difference between the Apple DWP and most other daisy wheel printers is that our print wheels contain 130 characters, rather than the normal 96. Our print wheels are therefore larger and contain characters at different locations on the wheel from most other wheels.

To operate successfully, then, the Apple DWP requires different hardware, a special print head, and special control software.

ImageWriter: Interface Specifications (8/94)

=====

Article Reviewed/Updated: 31 August 1994

TOPIC -----

This article gives the interface specifications for the Apple Imagewriter printer.

NOTE: This product is discontinued and is no longer available.

DISCUSSION -----

1. Data Input Form:
 - 7-bit or 8-bit serial: 1 start bit
 - 7 or 8 data bits
 - 1 stop bit (no parity bit)
2. Data Input Codes:
 - Characters: ASCII, 8- or 7- bit
 - Graphics: 8-bit binary
3. Transmission Speed: 300, 1200, 2400, or 9600 baud
4. Input Buffer Size: 1K bytes
5. Printer Connector: DB-25 male, or equivalent
6. Mating Connector: DB-25S female, or equivalent
7. Printer Pin Out

Pin No.	Symbol	Description	Direction
1	FG	Frame Ground	
2	SD	Send Data	Output
3	RD	Receive Data	Input
4	RTS	Request to Send	Output

7	SG	Signal Ground
14	FAULT	FaultOutput
20	DTR	Data Terminal Ready Output

8. Signal Description

9. Frame Ground: Grounding line for circuit protection.

10. Send Data: Serial dot transmission line to the computer from the printer. False when no data is being sent; true when data is being sent.

11. Receive Data: Serial data transmission line to the printer from the computer. False when no data is being sent; true when data is being sent.

12. Request to Send: Output signal from the printer; true when the printer is turned on.

13. Fault: Output signal from the printer. False when the printer is deselected; true when selected.

14. Data Terminal Ready: Output signal from the printer. True when the printer is on and able to receive data; false when unable to receive data.

15. Signal Levels:

RD: Maximum +15 Volts, minimum +5 Volts.

SD, RTS, DTR, and FAULT signal levels: Normal +7 Volts.

16. Protocol

The printer is capable of two types of data protocol: XON/XOFF or Data Terminal Ready (DTR). The DTR protocol uses the DTR signal to indicate the printer state. The XON/XOFF protocol uses the serial ASCII codes for XON and XOFF.

Apple III: Interfacing a LaserWriter and III E-Z Pieces (10/94)

Revised: 10/18/94
Security: Everyone

Apple III: Interfacing a LaserWriter and III E-Z Pieces (10/94)

Article Created: 22 July 1985
Article Reviewed/Updated: 18 October 1994

TOPIC -----

The following describes the connection between III E-Z Pieces on the Apple III and the LaserWriter.

DISCUSSION -----

I. Apple III:

A. Driver: .RS232

1. Data Configuration Block:

0	1	2	3	4	5	6	7	8	9	A	B
--	--	--	--	--	--	--	--	--	--	--	--
0E	00	00	00	00	80	13	11	DF	84	50	00

No parity is set automatically in the Printer Mode.

II. The Connection

1. Cables

- Connect Modem Eliminator Cable (Part #590-0166) to the connector on the back panel of the Apple III.
- Connect the Serial and Communications Cable (Part #590-0037) to the connector on the Laserwriter.
- Connect the remaining ends of the two cables together.
- Here is a diagram of the connection:

From:					To:
Apple III					LaserWriter
Back panel Serial Port					
DB-25 connector					DB-25 connector
signal	-	pin	wiring	pin	- signal
Frame Ground	1		<->	1	Frame Ground
Tx	2		<->	3	Rx (Receive Data)
Rx	3		<->	2	Tx (Transmit Data)
RTS	4		<->	4	RTS (Ready To Send)
Signal Ground	7		<->	7	Signal Ground
DTR	20		<->	20	Tx (Transmit Data)

III. LaserWriter

1. Set the Selector Switch on the LaserWriter to "Special". This can be done without turning off the printer. In Diablo 630 emulation mode the LaserWriter uses 9600 baud, XON/XOFF protocol, and no parity.

IV. Verification

1. To verify the connection, turn on the III, video monitor, and LaserWriter. Boot III E-Z Pieces and choose "Other Activities" from the Main Menu. Add a custom printer, naming it LaserWriter.

Use these settings for this custom printer:

- | | |
|---------------------------------------|------------|
| 1. Needs line feeds after each Return | No |
| 2. Accepts top-of-page commands | Yes |
| 3. Stop at end of each page | No |
| 4. Platen width | 8.0 inches |
| 5. Printer codes | Yes |

The printer codes for the Diablo Emulation are in the LaserWriter Technical Description. If you specify no printer codes, the typeface will default to Courier standard, 12 characters per inch, monospaced.

2. Return to the Main Menu and try to print a document.
3. Be aware that when you use the 3E-Z Pieces command OA-H (for hard copy), you will have to print a document using OA-P before you may use the OA-H command again. This is because the command OA-H does not issue the form feed the LaserWriter needs to clear its Diablo emulation settings.

Apple IIC: Using it With Direct Current (10/94)

Revised: 10/18/94
Security: Everyone

Apple IIC: Using it With Direct Current (10/94)

=====
Article Created: 22 July 1985
Article Reviewed/Updated: 18 October 1994

TOPIC -----

Can I run my Apple IIC from a dc power supply, bypassing the Apple power supply?

DISCUSSION -----

To power the Apple IIC with a source of direct current, you must:

1. Use a 7 pin DIN connector.
2. Check the DC power source for the proper voltage level, +9 to +20 volts DC.
3. Use wire rated for 1.2 amps (regular lamp cord is fine) to:
 - a. Connect the positive terminal lead of the power source to pins 5 and 6
 - b. Connect the negative terminal lead of the power source to pins 2, 3, and 4. Pins 2 and 3 are signal ground; pin 4 is chassis ground.

Please refer to the Apple IIC Reference Manual for more information on "The External Power Connector".

Applesoft: Editing files

Revised: 7/27/85
Security: Everyone

Applesoft: Editing files

=====

These keystrokes can be used to edit Applesoft files on a IIe, Enhanced IIe, IIc, and (to a limited degree, depending on what keys are available) on a II or II+ in 40- or 80-column display mode.

<CTRL>X	Cancel an input line
<ESC>E	Clear from cursor to the end of the line
<ESC>F	Clear from cursor to the end of the text window
<ESC>@	Clear entire text window and home cursor to top left of screen
Left Arrow, <CTRL>H	Backspace (As you backspace over each character, Applesoft removes it from memory.)
<ESC>B	Left cursor one position at a time
<ESC>Left Arrow, <ESC>J	Left cursor one position with repeat mode
<ESC>A, Right Arrow, <CTRL>U	Right cursor one position at a time
<ESC>K, <ESC>Right Arrow	Right cursor one position with repeat mode
<ESC>C, Down Arrow, <CTRL>K	Down cursor one line at a time
<ESC>M, <ESC>Down Arrow	Down cursor one line with repeat mode
Up Arrow, <CTRL>J	No effect in Applesoft
<ESC>D	Up cursor one line at a time
<ESC>I, <ESC>Up Arrow	Up cursor one line with repeat mode

Notes:

1. Keys you press with the Escape key may be either upper- or lowercase.
2. To get out of the repeat (Escape) mode, press the space bar. Pressing any other key will also get you out of Escape mode, except the escape keys A, B, C, D, I, J, K, M, E, F, @, or the arrows; so, to avoid confusion, get into the safe habit of pressing the space bar.
3. About the right arrow key and POKE 33,33, it is a fact that, once you start editing a statement, you must use the right arrow key for two functions: to re-establish the statement in memory and to save your edits to memory.

The first consequence of this fact arises when you edit statements that are longer than 40 columns: Applesoft breaks the lines automatically and puts blanks after each break to display the statement conveniently as multiple lines. As you use the right arrow key to edit a multi-line statement, Applesoft inconveniently puts those spaces into memory. So, since you are more interested in efficient editing than readable display, issue an immediate POKE 33,33 statement; this prevents Applesoft from putting in spaces.

The second consequence is that, before you edit the statement in any way, you must get the cursor to the beginning of the statement, which is the first digit of the statement number. Once you get the cursor at the beginning, you can start editing, moving the cursor with the right arrow key and typing your edits to change the statement in memory. So, before editing a particular statement, get the cursor to the beginning of the statement as follows:

- a. Issue a LIST (statement number) command, which will display the entire statement--for example, LIST 100.
- b. Press <ESC>.
- c. Press the arrow keys to position the cursor over the first digit of the statement number.
- d. Press the space bar to get out of Escape mode.
- e. Start editing.

For a longer explanation of Applesoft editing, refer to the Applesoft Tutorial, pages 73-86.

Macintosh: Connecting to a DEC VAX (2/95)

Revised: 2/2/95
Security: Everyone

Macintosh: Connecting to a DEC VAX (2/95)

Article Created: 22 July 1985
Article Reviewed/Updated: 2 February 1995

TOPIC -----

Is it possible to connect a Macintosh to a DEC VAX computer?

DISCUSSION -----

You can connect your Macintosh to a VAX computer from DEC (Digital Equipment Corporation), either directly or via a modem, and use a terminal emulator with the VT100 tool to access the VAX. Below are the pinouts for the cable you'll need to make if you decide to connect directly.

Mini DIN-8 to RS-232

The Macintosh Mini DIN-8 port pins have the following correspondent functions required to use them for RS-232:

DIN-8			
Pin#	Function	RS-232	Pin#
1	HSKo (Handshake input)	DTR	20
2	HSKi (Handshake output)	DCD	8
3	TxD- (Transmit data, negative going component)	TXD	3
4	GND (Chassis/Signal ground)	GND	7
5	RxD- (Receive data, negative going component)	RXD	2
6	TxD+ (Transmit data, positive going component)	GND	7
7	GPi (General-Purpose input)	NC	
8	RxD+ (Receive data, positive going component)	GND	7

DB-9 to DB-25

	Macintosh	VAX	
	DTE	DCE	
signal (in/out)	DB-9	DB-25	signal (in/out)

Gnd Chassis ground	*1	1	Gnd Chassis ground
Rx+ Receive data,positive going component	*8		
Gnd Signal ground	3	7	Gnd Signal ground
Tx- (in) Transmit data, negative going component	5	2	Tx (out) Transmit data
+12V +12-Volt line	6	20	DTR (in) Data Terminal Ready
HSK (in) Handshake	7	6	DSR (out) Data Set Ready
Rx- (out) Receive data, negative going component	9	3	RxD (in) Receive data
	2		no connection
	4		no connection

* NOTE: There are many variations on connecting pins 1, 3 and 8, but the basic intent is to bring all three of those pins to ground on the Macintosh side. Connect Signal Ground to Chassis Ground if you want a slightly better noise margin.

If this configuration doesn't work, try these additional cable connections:

+12V +12-Volt line	6	4	RTS (in) Request to Send
HSK (in) Handshake	7	8	DCD (out) Data Carrier Detect
HSK (in) Handshake	7	5	CTS (out) Clear to Send

Article Change History:

02 Feb 1995 - Added Mini Din-8 to DB-25 pinouts.

Laserjet Printer: Using it with AppleWorks (10/94)

Article Created: 22 July 1985
Article Reviewed/Updated: 18 October 1994

TOPIC -----

How can I print to my HP printer from AppleWorks?

DISCUSSION -----

In configuring Apple IIe to an H.P. Laserjet Printer, you will need the following equipment:

1. H.P. Laserjet Printer
2. Apple Super Serial Card
3. Male to Female Standard RS-232C Cable

Set the dip switches on the Super Serial Card as follows:

SW1:	1	2	3	4	5	6	7	SW2:	1	2	3	4	5	6	7
ON				X		X	X	ON	X			X	X		
OFF	X	X	X		X			OFF	X	X			X	X	
	1	2	3	4	5	6	7		1	2	3	4	5	6	7

From AppleWorks main menu, choose:

5. Other Activities
7. Specify Information on your Printer
2. Add a Printer
11. Custom Printer

Specify the slot from which the printer will be accessed, and then make the following further specifications:

1. Needs line feed: YES
2. Accepts top of page: YES

3. Stop at end of page: NO

4. Platen width: 8

5. Printer codes:

a. Characters per inch (CPI)

	CPI	Code
1.	10	Escape (s10H
2.	12	Escape (s12H
3.	15	Escape (s15H
4.	17	Escape (s17H

b. Lines per inch (LPI)

	LPI	Code
1.	6	Escape &l6D
2.	8	Escape &l8D

c. Underlining: Choose 'Printer has start/stop underline commands'

--Begin: Escape &dD
--End: Escape &d@

d. Boldface

--Begin: Escape (s3B
--End: Escape (s0B

e. Subscript

--Begin: Escape &a+25V
--End: Escape &a-25V

f. Superscript

--Begin: Escape &a-25V
--End: Escape &a+25V

Super Serial Card: Cable for Okidata 82A, 83A, 92, 93A (11/96)

Article Created: 27 July 1985
Article Reviewed/Updated: 21 November 1996

TOPIC -----

Listed below is the information needed to connect the Super Serial card to an Okidata 82A, 83A, 92 or 93A printer.

DISCUSSION -----

82A and 83A Cable

Super Serial Card (SSC)	Cable	Printer Connector
Frame Ground(FG)..... 1	<----->	1.....(FG)
Transmit Data (Tx) 2	<----->	3.....(Rx)
Receive Data (Rx) 3		
Request to send (RTS) 4		
Clear To Send (CTS) 5		
Data Set Ready (DSR) 6	<----->	11
Signal Ground(SG)..... 7	<----->	7.....(SG)
Data Carrier Detect (DCD) 8		
Secondary Clear To Send (SCTS) ... 19		
Data Terminal Ready (DTR) 20		

82A and 83A Dip Switch Settings

FRONT		BACK	
1 - OPEN		1 - CLOSED	
2 - OPEN		2 - CLOSED	
3 - OPEN		3 - OPEN	
4 - OPEN		4 - CLOSED	
5 - CLOSED		5 - OPEN	
6 - OPEN		6 - CLOSED	

- 7 - OPEN
- 8 - CLOSED

* Jumper blocks should be in position A. Refer to Okidata owners manual for more information on the jumper blocks.

92 & 93A Cable

The 92 & 93A high-speed serial interface may be connected to the Super Serial Card by means of a standard Apple serial cable.

92 and 92A Printer Setup

Set the printer to 9600 baud, 8 data bits and no parity. Check the owners manual for this information.

Super Serial Card Setup

Set the Super Serial Card's dip switches as you would for the ImageWriter, except for switch 1-7, which should be set to OFF for secondary clear-to-send.

* For more information refer to Tech Info Library article "Super Serial Card: Configuring for ImageWriter I".

Okidata 82 & 83 series printers: Using them with an Apple IIf

Revised: 7/27/85
Security: Everyone

Okidata 82 & 83 series printers: Using them with an Apple IIf

=====

The Okidata 82 and 83 series printers come with a standard parallel interface and a low-speed serial interface on the same board. You may use your IIf to run the printer from either interface, as follows:

-->Running the printer from the serial interface:

You may connect the IIf to the printer by means of the standard IIf serial cable. Since the interface in the IIf doesn't support all the handshaking signals provided by common serial interfaces, though, the data send rate must be slowed to 300 baud or less in order to keep the buffer from overflowing during printing. To configure the IIf's serial port for the same speed, change the Product Identification Number on the System Utilities disk, and then boot from that disk whenever you wish to print to the Okidata.

NOTE: This option makes for VERY slow printing. You may wish to purchase a high-speed serial interface to speed things up; the cost of such an interface ranges from \$100 to \$150.

-->Running the printer from the parallel interface:

The only way to run the Okidata parallel from the IIf is to obtain a serial-to-parallel converter.

AppleWorks: Not enough room on disk to save file

Revised: 4/9/91
Security: Everyone

AppleWorks: "Not enough room on disk to save file"

=====

When attempting to resave a previously-saved file on AppleWorks, you may occasionally be told that there is "Not enough room on disk" to comply with your request, even though you've made only minor changes to the file. The cause of the problem has to do with how Appleworks saves files.

AppleWorks saves the new copy of a file before deleting the old copy. Therefore, if the file you wish to save is 12K long (for example), you must have at least 12K of additional space available on the disk to which you wish to save. If that space is not available, you will get the error message.

The remedy is simply to free up a bit more space by deleting a file or two.

Apple IIC: Defeating the keyboard's repeat function

Revised: 8/5/85
Security: Everyone

Apple IIC: Defeating the keyboard's repeat function

=====

Certain users, such as those with physical disabilities, can find it advantageous to defeat the repeat function of the Apple IIC keyboard so that it's easier to use. The following procedure defeats the repeat function without changing the keyboard in any other way.

WARNING: The following procedure voids the warranty on the Apple IIC.

1. Open case of Apple IIC
2. Remove top cover of Apple IIC. Do not remove the logic board from the base or remove the disk drive.
3. Lift the keyboard and set it back on top of disk drive.
4. Locate the IOU chip (Part number 344-0021). It's the 40 pin IC to the right of the keyboard socket at location E14.
5. Carefully remove the IC.
6. Locate the small dot or indentation on the corner of the IC. That's PIN 1. Count to pin 31. (Pins 1 to 20 are all on the same side; pins 21 to 40 are all on the other side.)
7. Carefully bend out pin 31 from the side of the IC. This unhooks the AKD line from the IOU.
8. Carefully insert the IOU back into its socket making sure that pin 31 is the only one not inserted into its hole and that no other pins are bent.
9. Test the Apple IIC before you put the cover back on.
10. If it all works, reassemble the IIC.

Try the repeat function; it should no longer operate.

AppleWorks: Some cells lost in row.... error

Revised: 8/5/85
Security: Everyone

AppleWorks: "Some cells lost in row...." error

=====

Apple Works allocates a fixed amount of RAM space on a row-by-row basis for each row, allowing you to fill any given row with single digit values or small formulae. AppleWorks may not, however, allow you to fill the entire row with these small amounts of data because of the limited amount of RAM. Also, as a result of the limited RAM, the larger the amount of data for each cell, the fewer available cells per row. AppleWorks has an easier time with lots of large values and complex formulae stored vertically.

The overall size of the entire spreadsheet, then, isn't the problem--the layout is. Avoid the problem by planning your spreadsheet in a more columnar fashion, making it tall, not wide.

Macintosh System 4.1: Summary of Changes (3 of 3)

Revised: 2/23/89
Security: Everyone

Macintosh System 4.1: Summary of Changes (3 of 3)

=====

This article last reviewed: 17 November 1987

This is a part 3 of a summary of the changes made in the Macintosh System version 4.1.

Patches

-
- The Macintosh II Palette Manager is added. Among other things, it allows applications to display multiple windows simultaneously, even when they don't all use the same 256 colors.
 - System 4.1 corrects problems that occurred when using pointers to unlocked records.
 - System 4.1 fixes TextEdit problems with scrolling and justification.
 - The TextEdit changes added to the Macintosh SE and Macintosh II ROMs are also patched into the Macintosh Plus. These changes support TextEdit runs and style changes within a TextEdit record. See Inside Macintosh Volume V for details.
 - A SysEnvirons trap is added for applications to use to check on information concerning the hardware and System the application is running under.
 - The SCSI Select timeout is increased to 250 milliseconds.
 - The SCSI routines added to the Macintosh SE and Macintosh II are added to the System file.
 - External file systems can handle non-Macintosh volumes on disk drives designated for Macintosh volumes.
 - Macintosh Plus patches include changes to SANE routines.

Windows

- The standard document window defproc (WDEF 0) and rounded-corner window defproc (WDEF 1) check the identity of the Macintosh on which it is being used and supports drawing window structures in color when appropriate. Both defprocs have version number 10.

Miscellaneous System Resources

- "cctl" is the system default control colorTable.
- "cicn" is the Color Mac icon used on startup.
- Color dialogs are found in "dctl" resources.
- The new resource "mitq" holds information for MakeITable about the amount of memory to allocate for internal temporary structures.
- The system default window colorTable is found in "wctl".

LaserWriter: Printing long documents from an IBM PC

Revised: 3/4/90
Security: Everyone

LaserWriter: Printing long documents from an IBM PC

=====

This article last reviewed: 29 September 1987

As part of the revision that took place in PostScript that is in the 2.0 ROMs, DTR handshaking was implemented. Any LaserWriter that shows 2.0 on the test page supports hardware handshaking on either DB connector. Realize that this is only available in Interactive or Diablo mode.

Characters are sometimes missing from long documents printed by a LaserWriter with the older ROMs when the LaserWriter is in in Diablo 630 Emulation mode and connected to an IBM PC. The characters are missing because the two devices support different protocols. The IBM PC only supports hardware handshaking; the Laserwriter with ROM's before 2.0, XOn/XOff handshaking.

If you do not want to upgrade the LaserWriter ROMs, there are two workarounds: an intermediary device and a spooling program.

1. Intermediary device

Use a Quadram Buffer Box as an intermediary device between the IBM PC AT and the LaserWriter. The Quadram will do the necessary protocol conversion.

2. Spooling program

Use a spooling program to command the IBM PC to redirect the output for the LaserWriter to a communications port and set the handshaking to XOn/XOff. One such program, Superspool, comes with AST multi-function boards.

The Superspool command

```
superspl lpt1:=com1:/rate=9600,n,8,1/on=xon/off=dcd,cts,dsr/m=4
```

redirects printer output to communications port 1, sets the communications port for 9600 baud, no parity, 8 data bits, 1 stop bit, turns on XON/XOFF handshaking, turns off all hardware handshaking, and sets aside 4K bytes of memory for a print buffer.

This command should be used instead of MODE commands which redirect the printer output and set the communications parameters.

Macintosh Office: Glossary of standard terms

Revised: 5/11/89
Security: Everyone

Macintosh Office: Glossary of standard terms

=====

For general clarity and consistency, use these Macintosh Office terms in the contexts demonstrated:

Disk Server: Another name for a large disk, usually a multi-MegaByte Winchester. You can access it like a floppy or microdisk. A disk server cannot intelligently control of file access or disk space allocation. Users control allocation via a master disk.

File Server: An intelligent controller for dynamically allocating and de-allocating disk space as needed by the user. Additionally, it can perform functions similar to those associated with Electronic Mail: it can lock a file from a user and, while one user has a file open, it can allow read access but not write access to other users.

Comm Server: An intelligent controller for communicating with other systems or networks over a telecommunications link. It can handle conversions for speed, protocol, and limited file formats.

Gateway: A way for AppleTalk to communicate with another type of network through a direct connection between both types. Decnet and Wangnet are examples of other types of networks. The gateway involves conversions for speed, protocol, and limited file formats.

Bridge: A way for two AppleTalk networks to communicate via a direct connection. No conversions for speed or protocol are involved.

Half-Bridge: A way for two AppleTalk networks to communicate via a telecommunications link. A conversion for speed occurs; there are no conversions for protocol or file format.

Apple IIC: Pinouts & Switch Settings To Hayes Modem (9/95)

Article Created: 5 August 1985
Article Reviewed/Updated: 19 September 1995

TOPIC -----

Following are the pinouts and switch settings for interfacing an Apple IIC and Hayes modem.

DISCUSSION -----

Begin_Table

Pinouts:

Hayes Modem		Apple IIC
2	<->	4
3	<->	2
6	<->	1
7	<->	3
20	<->	5

Modem switch settings for 1200 baud:

1	2	3	4	5	6	7	8
down	up	down	up	down	down	up	down

300 baud: Same settings

These settings are not for the Hayes 2400 Baud Modem.

End_Table

Access II: Volume Not Found error

Revised: 5/25/89
Security: Everyone

Access II: "Volume Not Found" error

=====

When formatting a disk under Access II, make sure that you enter the volume name in UPPER CASE. Version 1.0 does allow you to enter a volume name in lower case, but a disk formatted with a lower-case volume name can't be accessed. After attempting to access such a disk, you'll get a "Volume Not Found" error, even though the attempt was made with a valid volume name and correct pathname syntax.

This problem was fixed in later versions of Access II.

IEEE-488 Interface Card: Product Description (11/96)

Revised: 11/21/96
Security: Everyone

IEEE-488 Interface Card: Product Description (11/96)

Article Created: 05 August 1996
Article Reviewed/Updated: 14 November 1996

TOPIC -----

This article describes the Apple IEEE-488 Interface Card. This card has been discontinued and is no longer available from Apple.

DISCUSSION -----

Technical Specifications
=====

As a Listener/Talker/Controller, the Apple IEEE-488 Interface card provides a fully compatible subset of the IEEE-488 standard. (Its only limitation is that it cannot pass control to another IEEE-488 controller.)

The interface card can also function as a device on the IEEE-488 bus. With a user-defined program, the card can be used to attach non-IEEE-488-compatible instruments to the bus.

General Purpose Instrument Bus Commands

WRITE	Write Data Out
WRITECNT	Write Data Out with Count
READ	Read Data In
READCNT	Read Data In with Count
XFER	Transfer Data
TRIGR	Group Execute Trigger
CLRAL	Clear All Devices
CLEAR	Clear Selected Devices
REMAI	Remote Enable All
LLKAL	Local Lockout All Devices
LOCAL	Local Mode All Devices
LOCDV	Local Mode Selected Devices

SRQD	Service Requested
SPOOL	Serial Poll
PPOLL	Parallel Poll
PPENB	Parallel Poll Enable
PPDIS	Parallel Poll Disable
PPDIS	Parallel Poll Disable
PPUAL	Parallel Poll Unconfigure All Devices
DEVICE	Controller Device Number
LINEFEED	Line Feed Control
EOS	End of String Character
SCREEN	Screen Control
ABORT	Clear All Interfaces
UNTALK	Universal Untalk

Device Capabilitie

SH1, AH1, T3, L1, DC1, DT1, C1, C2, C3, C4, C25.

Operating Life

To increase operating life, devices on the bus not in use should be turned off. However, proper operation of the bus requires some of the devices be turned on. The rule of thumb is the computer plus at least half of the devices connected to it must be powered on.

Software

The following software is supported by on-board, ROM-based firmware and signal protocol on the bus is handled by the resident software.

1. BASIC
2. Assembly macro commands
3. Pascal and FORTRAN through assembly language routines

Maximum Devices

Per card: 14

Maximum cards

Per computer: 7

Package

=====

Apple IEEE-488 Interface Card terminates in standard IEEE-488 socket.

..TIL01258-IEEE-488_Interface_Card-Product_Description_11-96.pdf

Back-panel bracket connects to Apple case ground (for low RFI systems)

Instruction manual includes GPIB connections, listener addresses, talker addresses, secondary addresses, and control codes.

System Configuration

Access II: Common problems with recording files

Revised: 5/25/89
Security: Everyone

Access II: Common problems with recording files

- =====
1. Start the recording by pressing CTRL-R. When through recording, you must press CTRL-R again to stop recording and to close the file properly so that other programs can read it.
 2. While in recording mode, Access II may display a file error message, such as "Disk Full" or "Bad Pathname". "Bad Pathname" means that you must get to the setup menu's option to Change Recording File Name and start a new recording file with a valid ProDOS Pathname.

To avoid the error message "Disk Full" in systems with two drives, use a blank disk in the second disk drive as the volume of the recording file. To avoid the error in systems with one drive, make and use a copy of the program disk, first removing from the copy the unnecessary sample files and 40- or 80-column files. NEVER attempt to record onto a program disk or a copy of one if the disk contains very little room.

3. If you unsuccessfully attempt to use "Receive A File", the sending computer may not be using the XModem protocol required by that feature. If the sending machine is indeed not using Xmodem, you must create a recording file and record the file from terminal mode.
4. If a recording file cannot be read by another program, the file is probably not properly closed, as described in (1) above; or, there may be control characters in the recorded file that the program simply cannot deal with.

EtherTalk Interface Card: General Troubleshooting (Part 2 of 2)

Revised: 1/30/92
Security: Everyone

EtherTalk Interface Card: General Troubleshooting (Part 2 of 2)

=====

This article last reviewed: 16 November 1987

o TWO-CARD TEST

Materials Required:

MacTest II diskette
Macintosh II
Known-good EtherTalk Interface Card
Terminator kit (077-0256)
Thin Net Test Cable (077-0257)

Procedure:

1. If you are not using a known-good Macintosh II to test the EtherTalk Interface Card, start up MacTest II and run the logic, drive, and monitor tests. (See Section 3, Diagnostics, of the Macintosh II Technical Procedures.) Complete any needed repairs before you continue.

2. Turn the Macintosh II power off.

3. Put on your grounded wriststrap and set the EtherTalk Interface Card on the grounded workbench pad. Set the jumper on both EtherTalk Interface Cards for thin cable, and install the cards in the Macintosh II. (See the "Setting the Jumper", later in this article.)

NOTE: Record the slot numbers used by the card under test and by the known-good card. The slot numbers are 1 (which is next to the power supply) through 6 (which is farthest from the power supply).

4. Assemble and install the loopback cable as follows:

a) Select two T-connectors and two terminators from the terminator kit (Figure

2). For each T-connector, connect the female end of one terminator to one of the male ends on the T-connector.

b) Connect each end of the thin net test cable to the remaining male end on each T-connector.

c) Locate the male connector on each EtherTalk Interface Card. Join the remaining female connector on each T-connector to the connector on each card.

5. To start the diagnostic, insert the MacTest II diskette into drive one (right), and turn on the power. (For MacTest II operating instructions, see Section 3, Diagnostics, of the Macintosh II Technical Procedures.)

6. Select the two-card test as follows:

a) Pull down the Options menu and select Test Selections.

b) Click on the EtherTalk Interface Card check box until an X is displayed in the check box. In the box to the right of the test name, enter the expansion slot number for the card under test.

c) Click on the known-good card check box until an X is displayed in the check box. In the box to the right of the test name, enter the expansion slot number for the known-good card.

d) Click OK. (You may want to turn off all other tests to reduce testing time.)

7. Click on the Start button.

NOTE: If you did not install the loopback cable in Step 4, or if you did not install it properly, MacTest II displays a window asking you to install the connector. Turn the power off (to reset the EtherTalk Interface Card), install the loopback cable as described in Step 4, and continue this procedure at Step 5.

MacTest II runs until the test passes, or until a failure is detected. If the test fails, MacTest II displays a window with troubleshooting instructions. For additional information, see Section 3, Troubleshooting.

o SETTING THE JUMPER

1. Locate the jumper and see if it is set for thick cable or thin cable.

2. If the jumper is set for thick cable, remove the jumper, and install it in the position for thin cable. (Do not forget to reset it before you return it to the customer.)

Section 3 Troubleshooting

o CONTENTS

- 3.1 Using the Flowchart
- 3.2 Troubleshooting Flowchart

o USING THE FLOWCHART

The flowchart includes references to notes on this page. These notes provide additional instructions or referrals to other procedures.

Starting at the top of the flowchart, answer the questions and proceed down the chart. When you arrive at a rectangular box containing a list of actions, perform the actions in the sequence listed. Upon completion of each action, test again to see if the action corrects the problem. If the problem remains, reinstall the original module before you go to the next action.

o TROUBLESHOOTING FLOWCHART

1. Refer to Section 2, Diagnostics.
2. If you suspect intermittent problems, repeat the test several times.

Apple Hardware: Radio and Television Interference

Revised: 6/22/92
Security: Everyone

Apple Hardware: Radio and Television Interference

=====

Article Created: 9 August 1985
Article Last Reviewed: 19 June 1992
Article Last Updated:

TOPIC -----

This article contains information on troubleshooting radio and television interference.

DISCUSSION -----

Apple equipment generates and uses radio-frequency energy. If the equipment is not installed and used properly, that is, in strict accordance with FCC instructions, it may cause interference with radio and television reception.

All Apple equipment has been tested and complies with the limits for a Class B computing device in accordance with the specifications in Subpart J, Part 15 of FCC rules. These rules are designed to provide reasonable protection against such interference in a residential installation. However, there is no guarantee that the interference will not occur in a particular installation, especially if you use a 'rabbit-ear' television antenna.

It's not difficult to determine whether your computer is causing interference: simply turn it off. If the interference stops, your equipment is indeed the culprit. To further isolate the problem, disconnect all peripheral devices and their input/output cables one at a time. (Connect or disconnect peripheral devices only after powering them, and the system, off.) If any disconnection causes the interference to stop, the problem is either the peripheral device or its I/O cable. Peripherals usually require shielded I/O cables; for Apple peripheral devices, you can obtain the proper shielded cable from your dealer. For non-Apple peripheral devices, contact the manufacturer or dealer for assistance.

If your computer causes interference to radio or television reception, you can try to correct the interference by using one or more of the following measures:

- Realign the TV or radio antenna until the interference stops.
- Move the computer farther from the TV, radio, or antenna.
- Plug the computer into an outlet that is on a different electrical circuit than the TV or radio.
- Consider installing a rooftop television antenna with coaxial cable lead-in between the antenna and TV.

If necessary, you should consult your dealer or an experienced radio or television technician for additional suggestions. You may find helpful the following booklet, prepared by the Federal Communications Commission,

"How to Identify and Resolve Radio-TV Interference Problems"
U.S. Government Printing Office
Washington, DC 20402

Macintosh External Drives: Proper Location Next to Compact Macs

Revised: 3/31/94
Security: Everyone

Macintosh External Drives: Proper Location Next to Compact Macs

=====

Article Created: 9 August 1985
Article Reviewed/Updated: 2 September 1993

TOPIC -----

Does it matter where I put my external floppy drive? I have a Macintosh Plus and because of space considerations, I'd like to put the drive on top of the Macintosh.

DISCUSSION -----

The power supply board, in your Macintosh Plus, is located on the left side of the computer and emits radio frequency interference (or RFI). RFI can damage the software in your external drives if you place them too near the power supply--to the left of your Macintosh Plus, for example, or on top of it. Such damage manifests itself in diskette read errors such as "Unable to recognize diskette" or "The file is damaged".

Placing drives on top of your Macintosh Plus is especially unwise: the drives will block the cooling vents, which for your Macintosh means overheating and a shortened lifespan. The proper place for external drives is to the right of the Macintosh. This information applies to all earlier and current compact Macintosh models.

EtherTalk Interface Card: General Troubleshooting (Part 1 of 2)

Revised: 1/30/92
Security: Everyone

EtherTalk Interface Card: General Troubleshooting (Part 1 of 2)

=====

This article last reviewed: 16 November 1987

Section 1 Basics

o INTRODUCTION

The EtherTalk Interface Card allows you to connect a Macintosh II to an Ethernet local area network.

When the EtherTalk Interface Card is installed and connected to the Ethernet cable, you can send and receive files over the Ethernet network using the A/UX operating system or the EtherTalk Installer software.

Section 2 Diagnostics

o CONTENTS

- 2.2 Introduction
- 2.3 One-Card Test
- 2.3 Materials Required
- 2.3 Procedure
- 2.5 Two-Card Test
- 2.5 Materials Required
- 2.5 Procedure
- 2.8 Setting the Jumper

o INTRODUCTION

MacTest II provides a one-card test and a two-card test for the EtherTalk Interface Card. The two-card test uses a known-good card in addition to the suspect card, and tests communications between the two cards.

Both tests check the functional areas of the suspect card independently. The two-card test also checks to see if each of the functional areas works properly with the other functional areas.

If possible, always run the two-card test. The one-card test cannot locate all problems. If the customer reports that the card cannot transmit or receive data, and if the card passes the one-card test, you need to run the two-card test.

NOTE: Neither test checks the DB-15 connector (which is used for thick Ethernet cable) on the EtherTalk Interface Card.

o ONE-CARD TEST

Materials Required:

- MacTest II diskette
- Macintosh II
- Terminator kit (077-0256)

Procedure:

1. If you are not using a known-good Macintosh II to test the EtherTalk Interface Card, start up MacTest II and run the logic, drive, and monitor tests. (See Section 3, Diagnostics, of the Macintosh II Technical Procedures.) Complete any needed repairs before you continue.)

2. Turn the Macintosh II power off.

3. Put on your grounded wriststrap and set the EtherTalk Interface Card on the grounded workbench pad. Set the jumper on the EtherTalk Interface Card for thin cable and install the card in the Macintosh II. (See the Setting the Jumper, in the article EtherTalk Interface Card: General Troubleshooting (Part 2 of 2) in the Technical Information Library.)

4. Assemble and install the loopback connector as follows:

- a) Select a T-connector and two terminators from the terminator kit. Connect the female end of each terminator to one of the male ends on the T-connector, and give the female connector barrel a twist to the right to secure the connection.

- b) Locate the male connector on the EtherTalk Interface Card, and join the female connector on the T-connector to the connector on the card.

5. To start the diagnostic, insert the MacTest II diskette into drive one (right), and turn on the power. (For MacTest II operating instructions, see Section 3, Diagnostics, of the Macintosh II Technical Procedures.)

6. If you do not know what expansion slot the EtherTalk Interface Card is in, pull down the Options menu and select Configuration. Note the expansion slot number of the EtherTalk Interface Card for use in Step 7.

7. Pull down the Options menu and select Test Selections. Click on the EtherTalk Interface Card check box until an X is displayed in the check box, and then enter the expansion slot number in the box to the right of the test name. (You may want to turn off all other tests to reduce testing time.) Then click on OK.

8. Click on the Start button.

NOTE: If you did not install the loopback connector in Step 4, or if you did not install it properly, MacTest II displays a window asking you to install the connector. Turn the power off (to reset the EtherTalk Interface Card), install the connector as described in Step 4, and continue this procedure at Step 5.

MacTest II runs until the test passes or until a failure is detected. If the test fails, MacTest II displays a window with troubleshooting instructions. For additional information, see Section 3, Troubleshooting.

IMPORTANT

For the two-card troubleshooting section, setting the jumper section, and the rest of the General Troubleshooting Procedures, refer to the article "EtherTalk Interface Card: General Troubleshooting (Part 2 of 2)".

Lisa 2: Failing To Respond On Large AppleTalk Networks

=====

This article last reviewed: 9 November 1988

A number of Lisa 2s--not 2/10s--were produced with pull-up and pull-down resistors on the input line of the serial port that AppleTalk uses. These resistors can create a problem for Lisas that are part of large AppleTalk networks, such as one 1800' long and containing 32 nodes. In such complex networks, these Lisas can fail to "hear" messages addressed to them and consequently can fail to respond.

To remedy the situation:

- On the Lisa I/O board, part #690-0117, cut the trace running pin 3 of RP4 (the resistor pack located to the left of the batteries).

- Remove R38 (the 10K ohm resistor located above the upper left-hand corner of the battery pack).

The pull-up/down resistors are now disabled; the Lisa will now respond properly to the network.

Monitors: An Explanation of Contrast and Brightness

=====

This article last reviewed: 16 November 1987

Brightness -

Brightness adjusts the overall level of the screen. The relationship between the level of white and black, or of colors, does not change; that is, white is still white, black is still black, and yellow is still yellow. It either dims or brightens the entire screen. There is very little change in the screen when the brightness is adjusted.

Contrast -

The contrast adjustment controls the overall gain of the video amplifier. Adjusting the contrast to its maximum "on" position will make the whites appear whiter and the blacks appear blacker. Contrast will make both white and black (also colors, if applicable) move toward each other, i.e. makes the relationship between the white level and the black level change. Turning the contrast down will tend to make both the whites and the blacks look grey. You will see a large swing from very light to very dark when adjusting contrast (the screen will appear to get darker or lighter).

Example -

Consider a room that is painted half black and half white. It has two controls, one for brightness and one for contrast.

If the brightness control is adjusted, it acts like a light dimmer, controlling whether the amount of light in the room brightens or darkens. However, the black half of the room stays black and the white half of the room stays white. There is just less light in the room.

If the contrast control is adjusted, the relationship between the black and white colors of the room actually changes. When the contrast is turned down, the white half of the room will actually become greyer or move toward black, and the the black half of the room will become greyer or move towards white;

making it harder to differentiate between black and white, as they both now look the same (grey). Turning the contrast up will make a greater difference between the black and white colors, which makes it easier to differentiate between black and white.

Apple IIC: Setting serial port 2's firmware from BASIC (1 of 2)

Revised: 3/10/86
Security: Everyone

Apple IIC: Setting serial port 2's firmware from BASIC (1 of 2)

=====

If DOS or ProDOS is in RAM, you can access the firmware of serial port 2 from BASIC using the list of command codes below.

- To change a firmware setting when the port is in terminal mode, issue a CTRL-D (hex 04), IN#2, the command character CTRL-A, and the command code.
- To change a firmware setting when the port is in non-terminal or local mode, issue a CTRL-D (hex 04), IN#2 or PR#2, the command character CTRL-A, and the command code.
- To change the firmware setting without DOS or ProDOS, leave CTRL-D out of the string and issue the IN#2 or PR#2, command character, and code.

As soon as you issue the command character, the serial port firmware displays a flashing question mark cursor to indicate that it's awaiting a command code. If you press RETURN, you get the current video cursor again. You do not have to press RETURN after command codes.

Subsequent input and output are routed to the modem (or other communications device) connected to serial port 2 until the next IN# commands that the input be routed to another port. You can therefore issue the CTRL-D and IN#2 and then a string of command codes, each beginning with the command character CTRL-A, to change more than one setting of the port firmware.

We recommended two substitutes to the command character CTRL-A: CTRL-V and CTRL-W. To make the substitution, issue the current command character and follow it with the substitute command character, e.g. CTRL-A CTRL-V.

For example, to set the port and startup AppleWorks:

1. Write a program to set the Apple IIC port and end the program with the line:

```
50 D$=CHR$(4)
100 PRINT D$;"-APLWORKS": REM Launch AppleWorks
```

2. Save the program as STARTUP on the AppleWorks startup disk.
3. Rename the file /APPLEWORKS/APLWORKS.SYSTEM as /APPLEWORKS/APLWORKS to match the named file in line 100 in step 1 above.
4. Copy the file BASIC.SYSTEM to the AppleWorks startup disk.
5. Boot the AppleWorks startup disk. STARTUP will set the port and then pass control to AppleWorks.

Apple IIC: Setting serial port 2's firmware from BASIC (2 of 2)

Revised: 3/10/86
Security: Everyone

Apple IIC: Setting serial port 2's firmware from BASIC (2 of 2)

=====

--Modem Port Command Codes:

1. Line width
 - a. Code: A number from 1 through 255 followed by a carriage return.
 - b. Code: A number from 1 through 255 followed by the letter N. This form of the command code also means that output will not be echoed to the screen.
 - c. To turn off automatic generation of carriage return, either:
 1. use the Z command,
 2. use the System Utilities Disk.

2. Baud rate

Code	Rate
1B	50
2B	75
3B	110 (109.92)
4B	135 (134.58)
5B	150
6B	300
7B	600
8B	1200
9B	1800
10B	2400
11B	3600
12B	4800
13B	7200
14B	9600
15B	19200

3. Data format

Code	Data bits	Stop bits
0D	8	1

1D	7	1
2D	6	1
3D	5	1
4D	8	2
5D	7	2
6D	6	2
7D	5	2

4. Echo output on the screen

Code	Effect
I	Output is echoed on the screen.

5. Line feed after carriage return.

Code	Effect
K	A line feed is not sent after a carriage return.
L	A line feed is sent after a carriage return.

6. Parity

Code	Parity
0P	None
1P	Odd
2P	None
3P	Even
4P	None
5P	MARK (1)
6P	None
7P	SPACE (0)

7. Terminal Mode

Code	Effect
T	Enter Terminal Mode. Use this command after IN#2 only. If you follow this command by PR#2, the Apple IIC will echo input to output. If the other device does so too, the first character entered will loop endlessly, locking up the system. Use CTRL-RESET to get out.
Q	Quit terminal mode.

8. Reset

Code	Effect
R	Reset port 2 and exit from serial port 2 firmware.

9. Break

Code	Effect
------	--------

S	Send a 233 millisecond BREAK character.
---	---

10. Ignore

Code	Effect
------	--------

Z	Zap (ignore) further command characters until CTRL-Reset. NOTE: Do not format output or insert carriage returns into output stream.
---	--

11. Terminal mode command codes from remote devices

Code	Effect
------	--------

CTRL-T	If IN#2 is already in effect, this command puts the Apple IIC in terminal mode, just as does the local command T.
--------	---

CTRL-R	This command undoes the remote terminal mode command. If IN#2 and PR#2 are in effect, the remote keyboard and display become the input and output devices of the local Apple IIC.
--------	---

WARNING: Apple IIC firmware DOES NOT allow you to use control characters B, C, H, I, J, L, M, or Y: doing so may cause unpredictable effects.

MacTest 6.0: Wrong Error Number During Test Of External Drive

Revised: 11/9/88
Security: Everyone

MacTest 6.0: Wrong Error Number During Test Of External Drive

=====

This article last reviewed: 9 November 1988

MacTest 6.0 displays an erroneous error number during the external drive test when it's run for the first time. You can perform a valid test without rebooting simply by running the external drive test a second time.

Follow these steps when you want to use MacTest 6.0:

1. Boot MacTest 6.0 on either a 512K or 128K Macintosh. Run all tests by choosing Start.
2. If all is well, Pass will be highlighted. Choose Select Test, then specify that only the external drive test be run.
3. Click on Start. MacTest will return a Failed message with the number 50010.0004.
4. Click on Start again. This time the drive test should run properly. If the external drive is good, the test will indicate "Pass"; if the test returns a "Failed" message again, the drive is indeed faulty.

Disk II: Specifications (Discontinued)

=====

This article last reviewed: 16 August 1985

I. Technical Specifications

A. Format

1. Sectoring: Soft (hard-sectored disks may be used)
2. Recording Surfaces: 1
3. Tracks per surface: 35
4. Sectors per track: 16
5. Bytes per sector: 256

B. Capacity

1. Formatted data capacity: 140K
 - a. 16 sector
 - b. Under: Pascal, DOS 3.3, and ProDOS
2. Available data capacity:
 - a. 16 sector
 - b. 137K under Pascal
 - c. 124K under DOS 3.3 and ProDOS

C. Characteristics

1. Head movement time:
 - a. 25 milliseconds track to track
 - b. 600 milliseconds across all tracks
2. Head load time: 50 milliseconds

3. Average rotational delay: 100 milliseconds

D. Packaging

1. Controller: Printed circuit board that plugs into one of the expansion slots.
 - a. Drives per controller: 2

2. Drive dimensions:

	inches	centimeters
a. Height:	3.25	8.3
b. Width:	5.75	14.6
d. Depth:	8.0	20.3
	pounds	kilograms
e. Weight:	3.0	1.36

3. Power source for drives: Apple system power supply

II. System Configuration

A. Apple II, II Plus, IIe, or Enhanced IIe

1. Recommended minimum memory: 32K
2. Controller card

Printer Paper: Correlating Thickness with Weight

Revised: 5/17/89
Security: Everyone

Printer Paper: Correlating Thickness with Weight

=====

Though paper is usually be ordered by its "weight", Apple printer manuals often specify a required type of paper by its thickness. The following table will help you determine, from the paper's thickness, the proper weight of paper to order.

Weight	Thickness	Thickness
(Pounds)	Original	Original + 3 Copies
	(Inches)	(Inches)
12	0.0025	0.01
15	0.0029	0.0116
18	0.0036	0.0144
20	0.0040	0.016

NOTE: This table lists thicknesses of only one typical sample of tractor paper; thicknesses of other types of paper, such as NCR paper, may be different.

Apple II Plus: How to Identify a Revision 7 Motherboard?

Revised: 11/20/87
Security: Everyone

Apple II Plus: How to Identify a Revision 7 Motherboard?

=====

This article last reviewed: 19 November 1987

Here's how to determine whether an Apple II Plus has a revision 7 motherboard or a pre-revision 7 motherboard:

- Look at the motherboard's part number. As you face the front of the computer, it's in the upper-left corner of the motherboard. The number begins with nnn-nnnn.
- If the part number ends with 07, or with A, B, or C -- the motherboard is revision 7. Otherwise, it's pre-revision 7.

ProDOS Assembler: INA and DEA commands

Revised: 4/9/91
Security: Everyone

ProDOS Assembler: INA and DEA commands

=====

Two of the new mnemonics available for use with the 65C02 are INA and DEA: Increment Accumulator and Decrement Accumulator. The ProDOS Assembler does not recognize these mnemonics. Therefore, after using the x6502 directive to support the 65C02 command, you must use the mnemonics INC and DEC without any parameters if you want to increment or decrement the accumulator. INC and DEC will assemble into the object code that uses the machine instructions associated with INA and DEA.

LOGO: Converting files to LOGO II

Revised: 9/5/85
Security: Everyone

LOGO: Converting files to LOGO II

=====

Apple LOGO is out in two versions: Apple LOGO and LOGO II. The later LOGO II does read conversions of program files of the earlier Apple LOGO. The CONVERT utility makes these conversions; CONVERT is on the ProDOS System Utilities and IIc Utilities Disks.

Keep in mind, however, these two facts:

1. Some commands are different in the later version, LOGO II. You must check each line of the file converted from Apple LOGO for commands that LOGO II does not recognize. If LOGO II doesn't know how to do an Apple LOGO command, you will have to update the command to the appropriate LOGO II command.
2. The converted files may contain references to the names of LOGO procedures that have different names in LOGO II. There may also be references to procedures that perform functions you do not want performed. These problems with names came with the addition of new built-in procedures or primitives in LOGO II. Again, as with the commands, you must check each line of the converted file for procedure name references that are erroneous or unintentional.

WPL: Using it to personalize form letters

Revised: 9/5/85
Security: Everyone

WPL: Using it to personalize form letters

=====

You can use WPL to personalize a form letter directly from the keyboard. Use the following sample Applewriter WPL program: it inserts text into a form letter or contract, allowing you to enter names, dates and other data into a preset form. The program then prints the final form with all the new data in place.

```
NY
L filename,D2
PIN Enter Date:   =$A
F/(DATE)/$A/A
PIN Enter Date:   =$B
F/(NAME)/$B/A
PIN Enter Sales Order #:   =$C
F/(SONU)/$C/A
PIN Enter Customer #:   =$D
F/(CUNU)/$D/A
PIN Enter Due Date:   =$A
F/(DUOT)/$A/A
PNP
```

Notes:

1. You're only allowed four variables in WPL (\$A,\$B,\$C,\$D). If you need more than four variables, simply use them over. \$A, for example, is assigned twice in the preceding program: once with the date, and then again with the due date.
2. There is a 64-character limit for each variable. Refer to your WPL manual for more information on programming in WPL.
3. The second line in the program is written for the DOS version of AppleWriter. For the SOS version, change the second line to L .D2/filename. For the ProDOS version, change it to: L /volumename/filename.

Below is a sample letter that demonstrates the way to set up a form to use with the WPL program shown above.

(DATE)

Dear (NAME)

Customer Number: (CUNU)

It has come to our attention that you have overpaid the invoice sent to you on sales order number (SONU). We will send you a check or credit your account for the overpayment. Please let us know by (DUDT) whether you would like a check or have your account credited.

Sincerely,

Freddy Friendly

Account Manager

Note that, as in the program AUTOLETTER in the WPL manual, the replacement strings (DATE), (NAME), (SONU), (CUNU), and (DUDT), must be exactly the same in both the program and the form letter.

Macintosh 128K & 512K: Specifications (Discontinued)

=====

Date Created: 16 June 1985
Article Reviewed/Updated: 26 September 1995

TOPIC -----

This article provides specifications for the Macintosh 128K and 512K.

DISCUSSION -----

MICROPROCESSOR

- Motorola MC68000, 32-bit architecture, 8 (7.8336) MHz clock speed

MEMORY

- 128K or 512K of RAM (Random Access Memory)
- 64K of ROM (Read Only Memory)

DISK DRIVE

- One built-in 400K disk drive. Optional external 400K disk drive.

SCREEN

- Built-in 9-inch diagonal, 512 by 342-pixel high-resolution bit-mapped monochrome display

INTERFACES

- Mouse port, DB-9 connector
- One eight-bit keyboard bus, 300 baud, RJ11 connector for Macintosh keyboard
- Two RS-232/RS-422 serial ports, 230.4K baud maximum (up to 0.920 Mbit per second if clocked externally), DB-9 connector
- External Disk Drive interface
- Sound port for external audio amplifier or headphones

CLOCK/CALENDAR

- CMOS custom chip with 4.5 volt battery backup (Eveready No. 523 or equivalent)

ELECTRICAL REQUIREMENTS

- Line voltage: 105 to 125 volts AC
- Line frequency: 50 to 60 hertz
- Maximum power: 60 watts

ENVIRONMENTAL REQUIREMENTS

- Operating temperature: 50 to 104 degrees F (10 to 40 C)
- Storage temperature: -40 to 122 degrees F (-40 to 50 C)
- Relative humidity: 5% to 90% relative humidity
- Altitude: 15,000 feet (4615 meters)

SIZE AND WEIGHT

- Height: 13.5 inches (34.6 cm)
- Width: 9.7 inches (24.6 cm)
- Depth: 10.9 inches (27.6 cm)
- Weight: 16 lb. 8 oz. (7.5. kg)

ImageWriter: MacWrite Form Feed Feature

Revised: 2/24/92
Security: Everyone

ImageWriter: MacWrite Form Feed Feature

=====

This article last reviewed: 16 September 1985

The Finder 4.1 update disk includes Imagewriter code that was revised and released in March 1985. When MacWrite starts to print documents with the "no breaks between pages option", MacWrite assumes that the pinch rollers are at the starting edge of the paper. The paper is rolled backward from this standard starting position whenever there is information in the top half-inch of the page, as is the case with labels, or when the "no breaks between pages " option is in effect. When the starting edge of the paper is rolled backward, this starting edge may slip out from between the pinch rollers and the platen; the edge of the paper may then cause a jam when it's moved forward as printing continues.

The Finder 4.1 disk, therefore, includes special new Imagewriter code that sends a form feed to the Imagewriter before MacWrite begins to print. This puts extra paper beyond the pinch rollers so that the Imagewriter can back up the paper without losing of control of it.

To avoid the form feed, either don't enter information in the top half-inch of the page or don't select "no breaks between pages", selecting "normal pages" instead.

ImageWriter General Troubleshooting

Revised: 1/30/92
Security: Everyone

ImageWriter General Troubleshooting

=====

This article last reviewed: 23 November 1987

DESCRIPTION:

Follow this procedure to determine whether the IW is functional.

YOU WILL NEED:

1. Apple IIe computer
2. Super Serial Card
3. Printer cable
4. the Level I Tech Procedures
5. ImageWriter User's Manual
6. Pencil and paper

BEFORE YOU START:

1. If replacement or adjustment procedures are needed, refer to the Tech Procedures.
2. If location for IW controls are needed, refer to the User's Manual.

CHECK 1: PRE-PRINT

- 1.1 Disconnect the printer cable at the back of the IW.
- 1.2 Check that the top panel is installed correctly.
- 1.3 Check that paper is installed.
- 1.4 Turn the platen knob.

PROB: The platen binds or doesn't turn consistently.

FIX: Pull off the platen knob and check for obstructions in the gears

- 1.5 Move the carriage to its rightmost position.

PROB: The carriage binds or doesn't move consistently.

FIX: Check that:

- * carrier wire is strung properly or out of tension specification as described in the Tech Procedures.

- * carrier bar is not too worn and is coated with thin

film of oil (oil type specified in the Tech Procedures).

CHECK 2: POWER ON INITIALIZATION

As you turn on the printer, check for 2.1, 2.2, 2.3, and 2.4.

- 2.1 The power lamp lights.
- 2.2 The platen should rotate one line backward and then one line forward.
- 2.3 The carriage should move smoothly to its leftmost position and stop.
- 2.4 The SEL lamp lights.

If any of the above do not occur as described, search on "HTS and ImageWriter and Initialization". The document you will obtain contains fixes for IW power on initialization problems.

CHECK 3: SELF TEST

To initiate Self Test: turn the printer off, and press Form Feed while you turn it back on. The printer should begin printing CHARACTER SETS.

If the printer prints character sets and the print quality is good, go to CHECK 4.

If the printer doesn't print character sets or the print quality is poor, search on "HTS and Imagewriter and Self Test". The document you will obtain contains fixes for IW Self Test problems.

CHECK 4: HOST PRINT

- 4.1 Turn off the printer, write down the customer's Super Serial Card and printer DIP switch configurations. Set the DIP switches as shown below:
(Note: Op = open, Cl = closed, up = On, dn = Off)

IW	_____SW2_____				_____SW1_____							
	Cl	Cl	Op	Op	Op	Op	Op	Op	Cl	Cl	Op	Cl
	1	2	3	4	1	2	3	4	5	6	7	8

S/S Card	_____SW1_____							_____SW2_____							MODEM/TERM
	Off	Off	Off	On	Off	On	On	On	Off	Off	On	On	Off	Off	jumper plug
	1	2	3	4	5	6	7	1	2	3	4	5	6	7	to term

- 4.2 Remove all peripheral cards from the IIe. Install the Super Serial card in slot 1. Connect the IW to the S/S card via the printer cable. Turn on the IW (make sure cover is installed). Turn on the IIe and press the RESET key while you press the CONTROL key (DO NOT BOOT A DISK). The cursor should blink.

Type the program exactly as shown below.

```
10 PR#1
20 FOR A = 1 TO 100
30 FOR I = 32 TO 126
```

```
30 PRINT CHR$(I);:NEXT I:PRINT
40 NEXT A
50 PR#0
60 END
```

4.3 Type RUN and press the <RETURN> key. The printer should print out about 100 character sets like the one shown below. If it does, the IW communicates with the computer OK.

```
!#$%&'()*+,-./0123456789:;<>?@ABCDEFGHIJKLMNPOQRSTUVWXYZ[\]^_`abcdefghijklmnopqrstuvwxyz{|}
```

If the printout is not OK, look below for problems.

- * If you get a SYNTAX ERROR on the computer, you may have mis-typed a line. To correct the syntax error perform the following:
 - (1) Type LIST and press <RETURN>. The program should appear on the screen.
 - (2) Examine the program for accuracy. Spaces, colons, etc. are important.
 - (3) To correct a line, simply retype the line and press <RETURN>. LIST again to make sure the correction is OK.
- * If nothing happens on the printer or the computer, press the RESET key while you press the CONTROL key. Then LIST your program as described above in the SYNTAX ERROR explanation to look for typing errors.
- * If no syntax errors occurred and the cursor is blinking again, then the program has probably run OK. Search on HTS and IMAGEWRITER and COMMUNICATIONS the document you will obtain contains fixes for IW hardware communications problems.

ImageWriter Power On Initialization Problems

Revised: 11/7/88
Security: Everyone

ImageWriter Power On Initialization Problems

=====

This article last reviewed: 11 Novmber 1988

DESCRIPTION:

When the printer is turned on, it should automatically perform a series of electromechanical operations that initialize it before printing.

The following table is composed of fixes for typical problems which may occur during power-on initialization.

YOU WILL NEED:

1. the Level I Tech Procedures
2. ImageWriter User's Manual

BEFORE YOU START:

1. If replacement or adjustment procedures are needed, refer to the Tech Procedures.
2. If a replacement doesn't fix the problem, reinstall the original module/part before continuing with the procedure.
3. If location for IW controls are needed, refer to the User's Manual.

INSTRUCTIONS

1. Turn on the IW, it should perform the following initialization actions:
 - (1) Light the Power lamp.
 - (2) Rotate the platen one line backwards and then one line forwards.
 - (3) Move the carriage to its leftmost position and stop.
 - (4) Light the SEL lamp.
2. If a problem occurs, find it below and perform the corresponding FIX.

- - - - -

PROB: The power lamp doesn't light when the IW is turned on.

FIX: Recheck for the problem after each of the following steps:

- (1) Check that power is turned on.
- (2) Check that the power cord is plugged in.
- (3) Check the power fuse at the back of the printer.
 - * If it is burned out, replace it and turn power on again.

* If the fuse blows a second time, replace components in this order (recheck for the problem after each replacement):

- a. CPU PC board
- b. Carrier motor
- c. Transformer
- d. power switch
- e. carrier motor
- f. transformer

(4) If the fuse is OK, swap the power cord.

(5) Check the three fuses on the CPU board and replace any if blown.

(6) Replace components in this order (recheck for the problem after each replacement): power switch, carrier motor, transformer.

PROB: When the printer is turned on, the platen doesn't rotate one line backward and then one line forward.

FIX: Recheck for the problem after each of the following steps:

(1) Pull off the platen knob and check for obstructions in the gears

(2) Check for loose connectors as you follow the procedure to replace the main logic PCB (found in the Tech Procedures binders).

* If you find a loose connector, don't replace the main logic PCB but instead install the connector securely.

* If you don't find a loose connector, replace the main logic PCB.

(3) Replace the mechanical assembly.

PROB: As the printer is turned on, the printer doesn't move the carriage smoothly from its rightmost to its leftmost position and stop.

FIX: Recheck for the problem after each of the following steps:

(1) Check if the carrier wire is strung properly.

(2) Check for loose connectors as you follow the procedure to replace the main logic PCB (found in the Tech Procedures binders).

* If you find a loose connector, don't replace the main logic PCB but instead install the connector securely.

* If you don't find a loose connector, replace the main logic PCB.

(3) Replace the carrier motor.

PROB: There is a burning odor, erratic carrier motion, or erratic platen rotation when the printer is turned on.

FIX: Recheck for the problem after replacing each of the following parts:

(1) CPU PC board

(2) Carrier motor

(3) Mechanical assembly

ImageWriter Self Test Problems

Revised: 11/7/88
Security: Everyone

ImageWriter Self Test Problems

=====

This article last reviewed: 1 November 1988

DESCRIPTION:

This table is composed of fixes for typical Imagewriter Self Test problems.

YOU WILL NEED:

1. Level I Tech Procedures
2. Imagewriter User's Manual

BEFORE YOU START:

1. If replacement or adjustment procedures are needed, refer to the Tech Procedures.
2. If a replacement doesn't fix the problem, reinstall the original module/part before continuing with the procedure.
3. If locations for ImageWriter controls are needed, refer to the User's Manual.

INSTRUCTIONS:

1. To initiate Self Test, press Form Feed while you turn on the printer.

* The printer should repeatedly print out end to end CHARACTER SETS like the one shown below. If it does and the print quality is good, the IW has passed Self Test.

!#\$%&'()*+,-./0123456789:;<>?@ABCDEFGHIJKLMN OPQRSTUVWXYZ[\]^_`abcdefghijklmnopqrstuvwxyz{|}

2. Find the problem below and perform the appropriate FIX.

- - - - -

PROB: There is a burning odor, or erratic carrier motion, or erratic platen rotation.

FIX: Recheck for the problem after replacing each of the following parts:

- (1) CPU PC board
- (2) Carrier motor

(3) Mechanical assembly

PROB: The printer doesn't repeatedly print sets of characters when Self Test is initiated.

FIX: Perform the following steps. Retry Self Test if a problem is found.

- (1) Check that the top cover is seated properly. If it isn't, close it. Then press SEL and re-try self-test.
- (2) Check if the PE lamp is lit on switch panel. If it is, reload the paper and try self-test.
- (3) Check the connectors between the carrier and carrier motor and the CPU PC board. If any of the connectors are loose, connect them.
- (4) Replace the CPU PC board.
- (5) Replace the carrier motor.

PROB: The printer prints character sets when Self Test is initiated but the print quality is poor.

FIX: Find your print quality problem in the tables below.

* DOTS MISSING

- (1) Make sure the dot head is in place.
- (2) Make sure the dot head is not clogged with dirt.
- (3) Make sure the dot head connector is properly plugged into CPU PC board.
- (4) Check impression control lever properly set. Push it away from you to its forwardmost position if using a single sheet of paper.
- (5) Replace the dot head.
- (6) Replace the CPU PC board.

* PRINT TOO LIGHT OR OF VARYING INTENSITY

- (1) Check that the impression control lever's position is properly set. If using a single sheet of paper, push the lever away from you to its forwardmost position.
- (2) Substitute a new ribbon cartridge.
- (3) Check if ribbon wire tension is too loose and adjust as necessary.
- (4) Adjust intensity pot located under the clear plastic sheet that covers the configuration switches. Locate VR2 IMPRES and adjust for optimum print density.
- (5) Replace the ribbon cartridge.
- (6) Replace the dot head.
- (7) Replace the CPU PC board.

* HORIZONTAL SPACING PROBLEM

- (1) Check if carrier wire is strung properly or out of tension specification.
- (2) Replace the carrier wire.
- (3) Replace the carrier motor.
- (4) Replace the CPU PC board.

* CHARACTERS DO NOT ALIGN VERTICALLY

Locate VR1 ALIGN under the clear plastic sheet that covers the configuration switches. Adjust for optimum vertical alignment.

ImageWriter Hardware Communication Problems

Revised: 11/7/88
Security: Everyone

ImageWriter Hardware Communication Problems

=====

This article last reviewed: 1 November 1988

DESCRIPTION:

This table is composed of typical Imagewriter communication problems and fixes. If your problem matches a symptom, perform the appropriate fix.

YOU WILL NEED:

1. Apple IIe computer
2. Super Serial Card and printer cable
3. Level I Tech Procedures
4. Imagewriter User's Manual
5. Pencil and paper

BEFORE YOU START:

1. If replacement or adjustment procedures are needed, refer to the Tech Procedures.
2. If a replacement doesn't fix the problem, reinstall the original module/part before proceeding with the procedure.
3. If location for IW controls are needed, refer to the User's Manual.

INSTRUCTIONS: In order to isolate a hardware communications problem, you first need to eliminate the possibility of a software or DIP switch configuration problem. To do this perform the following:

1. Turn off the printer, write down the customer's Super Serial Card and printer DIP switch configurations. Set the DIP switches as shown below:
(Note: Op = open, Cl = closed, up = On, dn = Off)

IW-SW2				IW-SW1							
Cl	Cl	Op	Op	Op	Op	Op	Op	Cl	Cl	Op	Cl
1	2	3	4	1	2	3	4	5	6	7	8

SSC-SW1							SSC-SW2							
Off	Off	Off	On	Off	On	On	On	Off	Off	On	On	Off	Off	MODEM/TERM jumper
1	2	3	4	5	6	7	1	2	3	4	5	6	7	block to TERM

2. Remove all peripheral cards from the IIe. Install the Super Serial card in slot 1. Connect the IW to the S/S card via printer cable
Turn on the IW (make sure cover is installed). Turn on the IIe and press the RESET key while you press the CONTROL key (DO NOT BOOT A DISK). The cursor should blink.

Type the program exactly as shown below.

```
10 PR#1
20 FOR A = 1 TO 100
30 FOR I = 32 TO 126
30 PRINT CHR$(I);:NEXT I:PRINT
40 NEXT A
50 PR#0
60 END
```

3. Type RUN and press the <RETURN> key. The printer should print out about 100 character sets like the one shown below. If it does, the IW communicates with the computer OK.

```
!#$%&'()*+,-./0123456789;:<>?@ABCDEFGHIJKLMN O PQRSTUVWXYZ[\]^_`abcdefghijklmnopqrstuvwxyz{|}
```

If the printout is not OK, look below for problems.

- * If you get a SYNTAX ERROR on the computer, you may have mis-typed a line. To correct the syntax error perform the following:
 - (1) Type LIST and press <RETURN>. The program should appear on the screen.
 - (2) Examine the program for accuracy. Spaces, colons, etc. are important.
 - (3) To correct a line, simply retype the line and press <RETURN>. LIST again to make sure the correction is OK.
- * If nothing happens on the printer or the computer, press the RESET key while you press the CONTROL key. Then LIST your program as described above in the SYNTAX ERROR explanation to look for typing errors.
- * If no syntax errors occurred and the cursor is blinking again, then the program has probably run OK so check for the problems below:

PROB: The printer does not print a set of characters.

FIX: Recheck for the problem after each of the following steps. If no problem is found, go to step 4.

- (1) Check that the computer is properly powered on and initialized.
- (2) Check that the SEL light is on. If it's not, press SEL and try to print from the computer again using the program above. If it prints while the SEL light is off, replace the switch panel.
- (3) Make sure that the interface cable between the printer and the

computer is connected and secured at both ends.

(4) Replace main logic PCB.

PROB: The printer prints a set of characters but print quality is poor.

FIX: Do a word search for "Imagewriter and HTS and Self Test Problems" to obtain the print quality FIX.

4. Reset the DIP switches to the customer's original configuration. Then refer to the User's Manual and the Appendix in the Imagewriter section of the Tech Procedures to see if the customer's DIP switch configuration caused the problem.

Disk II PROBLEM/CURE: Repeated Calibration (Constant Clacking)

Revised: 1/30/92
Security: Everyone

Disk II PROBLEM/CURE: Repeated Calibration (Constant Clacking)

=====

This article last reviewed: 28 April 1988

PROBLEM DESCRIPTION: When booting a known good system disk, the drive continually tries to calibrate at track 0. This causes a loud click clacking sound.

CAUSE: Recalibration is normal whenever a disk is booted. Then track 0 is read into memory. If the computer cannot read from track 0, the head is recalibrated again and again, until it succeeds in reading.

If the computer cannot read information on track 0; either the head is not arriving exactly at track 0, or something in the signal path is broken.

POSSIBLE CURE/S

- The disk speed is wrong - Perform D-Speed adjustment in Tech Procedures
- Track 0 stop is missing or bent - Replace the mechanical assembly
- The head is defective - Replace the mechanical assembly
- The stepper motor is malfunctioning - Replace the mechanical assembly
- Collet hub is out of adjustment - Check adjustment as specified in Tech Procedures

If problem is still not found, search on HTS, the disk drive's product name and GENERAL to obtain the General Troubleshooting procedure for the disk drive.

Apple III Hardware: 5-volt Confidence RAM Test

Revised: 11/9/88
Security: Everyone

Apple III Hardware: 5-volt Confidence RAM Test

=====

This article last reviewed: 9 November 1988

There is a Confidence RAM Test for Apple IIIs on the Confidence Disk and the Dealer Diagnostic Disk. With this test, you can locate bad chips on a 5-volt board.

--> NOTE: Before running the Confidence RAM test, remove all peripheral cards from the Apple III, especially any ProFile interface cards and Grappler printer cards.

The test results show the bank, address, and test expectations and actual performance. For example, after the test, say the console displays:

BNK 82, ADR 37AF, EXP 40, GOT 48.

To locate the bad chip, you must translate these results into a map that corresponds to the 2 banks of 16 chips on the memory board.

1. The bad chip is in bank 2. The bank number comes from the last digit of the BNK field.

BANKS: 0, 1, 2	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X
BANKS: 3, 4, 5, 6	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

2. The bad chip is in the right side of the bank. The side is determined by the range into which the address--37AF, the number in the ADR field--falls.

ADDRESS RANGE:
4000-7FFF

ADDRESS RANGE:
2000-3FFF
8000-9FFF

BANKS: 0, 1, 2	x	x	x	x	x	x	x	x	X	X	X	X	X	X	X
----------------	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---

ADDRESS RANGE:

ADDRESS RANGE:

4000-7FFF

2000-3FFF

8000-9FFF

BANKS: 3, 4, 5, 6 x x x x x x x x x x x x x x x x

3. The bad chip is D5. The bad chip shows up in the comparison of the binary representation of the hexadecimal values in the fields EXP and GOT, which contain the test expectations and performance. Any difference between the two indicates where to find the bad chip or chips.

hexidecimal binary hexidecimal binary hexidecimal binary

0	0000				
1	0001	6	0110	B	1011
2	0010	7	0111	C	1100
3	0011	8	1000	D	1101
4	0100	9	1001	E	1110
5	0101	A	1010	F	1111

EXP = 40 (hexadecimal) = 01000000 (binary)

GOT = 48 (hexadecimal) = 01001000 (binary)

EXP = 40 (hexadecimal) = 0 1 0 0 0 0 0 0 (binary)

GOT = 48 (hexadecimal) = 0 1 0 0 1 0 0 0 (binary)

ok ok ok ok ! ok ok ok

ADDRESS RANGE:

2000-3FFF

BANK 1 x x x x x x x x x x x x x X x x x

In the chip location number D5, the letter comes from the letter of the banks of chips on the memory board:

LETTER: D

BANKS: 0, 1, 2 x x x x x x x x x x x x X x x x

LETTER: C

BANKS: 3, 4, 5, 6 x x x x x x x x x x x x x x x

The number comes from the number of the chip on the memory board:

NUMBER: 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2

LETTER: D x x x x x x x x x x x x X x x x (BANKS 0, 1, 2)

C x x x x x x x x x x x x x x x (BANKS 3, 4, 5, 6)

Replace the bad memory chip(s) and run the test again. If the system fails the memory board test, exchange the memory board itself. If that dosen't help, exchange the main logic board.

Apple III Hardware: 12-volt Confidence RAM Test

Revised: 11/9/88
Security: Everyone

Apple III Hardware: 12-volt Confidence RAM Test

=====

This article last reviewed: 9 November 1988

A Confidence RAM Test for Apple IIIs is on the Confidence Disk and the Dealer Diagnostic Disk. With this test, you can locate bad chips on a 12-volt board.

--> NOTE: Before running the Confidence RAM test, remove all peripheral cards from the Apple III, especially any ProFile interface cards and Grappler printer cards.

The test results show the bank, address, and test expectations and actual performance. For example, after the test, say the console displays:

BNK 82, ADR 67AF, EXP 40, GOT 48.

To locate the bad chip, you must translate these results into a map that corresponds to the 3 banks of 16 chips on the memory board.

1. The bad chip is in bank 2. The bank number comes from the last digit of the BNK field.

BANK: 0	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
BANK: 1	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
BANK: 2	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X

2. The bad chip is in the right side of the bank. The side is determined by the range that the address, 67AF, the number in the ADR field, falls into.

	ADDRESS RANGE:	ADDRESS RANGE:													
	2000-3FFF	4000-7FFF													
	8000-9FFF

	ADDRESS RANGE:	ADDRESS RANGE:													
	0800-0FFF	0000-07FF													

	1800-1FFF	1000-17FF
	C000-C7FF	A000-BFFF
	D000-D7FF	C800-CFFF
	E000-FFFF	D800-DFFF
BANK 1	x x x x x x x x x	x x x x x x x

	ADDRESS RANGE:								ADDRESS RANGE:							
	2000-5FFF								6000-9FFF							
BANK 2	x	x	x	x	x	x	x	x	X	X	X	X	X	X	X	X

3. The bad chip is in location number B5. The bad chip shows up in the comparison of the binary representation of the hexadecimal values in the fields EXP and GOT, which contain the test expectations and performance. Any difference between the two is a map of where to find the bad chip or chips.

hexidecimal	binary	hexidecimal	binary	hexidecimal	binary
0	0000				
1	0001	6	0110	B	1011
2	0010	7	0111	C	1100
3	0011	8	1000	D	1101
4	0100	9	1001	E	1110
5	0101	A	1010	F	1111

```
EXP = 40 (hexadecimal) = 01000000 (binary)
GOT = 48 (hexadecimal) = 01001000 (binary)
```

```

EXP = 40 (hexadecimal) = 0 1 0 0 0 0 0 0 (binary)
GOT = 48 (hexadecimal) = 0 1 0 0 1 0 0 0 (binary)
                        ok ok ok ok ! ok ok ok

```

ADDRESS RANGE:
6000-9FFF

BANK 2 x x x x x x x x x x x x x X x x x

In the chip location number B5, the letter comes from the letter of the banks of chips on the memory board:

LETTER: D
BANK: 0 x x x x x x x x x x x x x x x x x x

LETTER: C
BANK: 1 x x x x x x x x x x x x x x x x

LETTER: B
BANK: 2 x x x x x x x x x x x x X x x x

The number comes from the number of the chip on the memory board:

NUMBER: 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2
LETTER: D x x x x x x x x x x x x x x x (BANK 0)

C	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	(BANK 1)
B	x	x	x	x	x	x	x	x	x	x	x	x	X	x	x	x	(BANK 2)	

Replace the bad memory chip(s) and run the test again. If the system fails the memory board test, exchange the memory board itself. If that dosen't help, exchange the main logic board.

AppleWriter WPL: Using AUTOLETTER to print mailing labels

Revised: 9/27/85
Security: Everyone

AppleWriter WPL: Using AUTOLETTER to print mailing labels

=====

You can use AppleWriter to print out mailing labels, using the address list of the WPL program AUTOLETTER that resides on the AppleWriter master diskette. Modify AUTOLETTER so that it reads as follows:

```
START    PSX1
LOOP     NY
        L .D1/FORMLLETTER
        B
        F/(ADDRESS)//
        Y$
        L .D1/ADDRS!<(X)>!<N
        PGO FOUND
        PGO QUIT
FOUND    PNP
        PSX +1
        PGO LOOP
QUIT     PIN Done at address (X) (press return)
        NY
```

1. Save this as AUTOLABELS on the disk with the form letter and address list.
2. Press CTRL-N, type y, and press RETURN.
3. Type in the following four lines, which show carriage returns:

```
(ADDRESS)]
]
]
]
```

4. Save this file as FORMLLETTER on the disk with AUTOLABELS.
5. Press CTRL-N, type y, and press RETURN.
6. Make sure that your printer parameters are set at the following:

Printed Lines (PL)=4
Page Interval (PI)=4

The rest of the printer parameters must be set in accordance with the printer you are using.

You can now run the AUTOLABELS program in the same way you run any WPL program.

Remember, the file to run is AUTOLABELS, not AUTOLETTER. Make sure that the disk with AUTOLABELS, FORMLETTER AND ADDRS is in the internal drive on an Apple III or in the current prefix volume on a IIe or IIc.

Apple II Pascal: Disk directory structure

Revised: 9/27/85
Security: Everyone

Apple II Pascal: Disk directory structure

```
=====

Const
  maxdir=    77;  {Maximum number of entries in directory}
  vidleng=    7;  {Number of characters in volume ID}
  tidleng=   15;  {Number of characters in title ID}
  fblksize= 512;  {Standard disk block length}
  dirblk=     2;  {Directory starts at this disk-block address}

TYPE
  datarec=
    PACKED RECORD
      month: 0..12;  {0 implies meaningless data}
      day:   0..31;  {Day of the month}
      year:  0..100; {100 implies the dated volume is temporary}
    END {datarec};

  vid=
    string[vidleng];

  dirrange=
    0..maxdir;

  tid=
    string[tidleng];

  filekind=
    {untyped, xdskfile, codefile, textfile, infofile, datafile,
     graffile, fotofile, securedir};

  direntry=
    PACKED RECORD
      dfirstblk: integer; {1st physical disk address}
      dlastblk: integer;  {Points at block following last used block}
      CASE DFKind: filekind of
        Securedir, untypedfile: {Only in dir[0] - this is volume info}
          [Filler1: 0..2048; {waste 13 bits for compatability}
           dvid:     vid;    {name of disk volume}
        else
          ;
```

```
    deovblk:    integer;      {last block in volume}
    dnumfiles:  dirrange;     {number of files in directory}
    dloadtime:  integer;      {Time of last access}
    dlastboot:  daterec];     {Most recent date setting}

    xdskfile, codefile, textfile, infofile, datafile,
    graffile, fotofile:      {regular file info}
    [filler2:    0..1024;     {waste 12 bits for compatability}
    status:      boolean;     {for filer wildcards}
    dtid:        tid;         {title of file}
    dlastbyte:   1..fblksize; {Number of bytes in files last block}
    daccess:     daterec];     {date of last modification}
    END; {case dfkind; direntry}
```

```
directory =
    ARRAY[dirrange] of direntry;
```

To use this information, do a UNITREAD on the desired volume.

For example,

```
PROGRAM ShowHow;
```

All of the above declarations plus:

```
VAR
    DirInfo: Directory;
    UnNum: Integer

BEGIN
    UnNum:=4;
    UNITREAD(UnNum,DirInfo,SIZEOF(DirInfo),2);
END.
```

This program reads the directory information on volume 4 and stores it in the Directory variable DirInfo. The last parameter, 2, indicates to UNITREAD to start reading with block 2, where the directory information starts.

With Pascal 1.3, you can chain to and from the filer and thereby easily handle files within programs.

Apple II, II+, IIe, IIc: ASCII characters, values & keystrokes

Revised: 10/23/86
Security: Everyone

Apple II, II+, IIe, IIc: ASCII characters, values & keystrokes

=====

The following table contains the ASCII codes generated by pressing a key or combination of keys on the Apple II, Apple II Plus, Apple IIe, Apple IIc, and Enhanced Apple IIe. The character names come from the American Standard Code for Interchange of Information. Certain peripherals or programs or functions, such as the BASIC function CHR\$, may require the decimal values; certain peripherals or programs may require the hexadecimal values as well.

The fourth column in the table below is for simple keystrokes or those made with the SHIFT key held down; the fifth and sixth columns are for those made either with the CTRL key held down or with both the SHIFT and CTRL keys held down simultaneously.

NOTE: An asterisk next to keystrokes or character names means that the Apple II and Apple II Plus can't generate that character from its keyboard. The double asterisk indicates a special case.

The comments column defines the non-printing ASCII characters.

Char	Dec	Hex	Keystrokes		Holding down:	Comments
			Regular		CTRL SHIFT-CTRL	
NUL	00	00			@ **	null character

ColorMonitor IIC, ColorMonitor IIE: Specs (Discontinued)

Revised: 9/14/93
Security: Everyone

ColorMonitor IIC, ColorMonitor IIE: Specs (Discontinued)

=====

I. Technical Specifications

A. Picture Tube

1. 14-inch diagonal (13 inch view)
2. Dot pitch: 0.52mm
3. High contrast (black matrix)

B. Input Signal:

1. Composite (NTSC) only
2. Synchronous negative
 - 1.0 +/- 0.5-volts peak to peak
 - internally terminated with 75 ohm resistor.
3. Input connector: RCA (phono) jack

C. User Controls:

1. Front:
 - Power switch
 - High resolution (white only) button
 - Brightness
 - Contrast
 - Color (hue intensity)
 - Tint
2. Rear:
 - Vertical size
 - Vertical hold
 - Horizontal hold
3. Side: Power switch of ColorMonitor IIC

D. Scanning Frequencies

	Horizontal Scan	Vertical Scan
1. NTSC/60	15.734 kHz	60 Hz

2. NTSC/50-PAL/50 15.659 kHz 50 Hz

E. Color Reference Frequency

1. NTSC/60 Hz: 3.579545 MHz
2. NTSC/50 Hz: 3.562456 MHz
3. PAL/50 Hz: 4.433618 MHz

F. Video Bandwidth

	Text Video (Monochrome)	Graphics Video (Color)
1. NTSC	8.0 MHz	3.0 MHz
2. PAL	8.0 MHz	3.8 MHz

G. Physical Dimensions:

1. Weight: 27.56 lbs (12.5kg) maximum

	inches IIE/IIc	centimeters IIE/IIc
2. Width:	14.4/13.4	36.7/34.0
3. Height:	12.4	31.5
4. Depth:	14.4	36.5

H. Power Consumption:

1. 50 watts normal at 120VAC
2. 75 watts maximum
3. Fuse Protection:
 - The monitor contains internal power line fuse protection.
This fuse should be replaced with the same type by a
qualified service technician.

I. Input Voltage

	Model	Operating Range	Power Frequency
1.	120v	108-132	50-60 Hz
2.	220v	198-242	50-60 Hz
3.	240v	216-264	50-60 Hz

NOTE: Input voltage is not adjustable within the monitor.

J. Environment:

	Degrees	
	Fahrenheit	Celsius
1. Operating:	41 to 86	5 to 30
2. Storage:	-31 to 140	-35 to 60

II. System Configuration

A. ColorMonitor IIE:

1. Apple II
2. Apple II Plus
3. Apple IIE

B. ColorMonitor IIC: Apple IIC

Copyright 1989 Apple Computer, Inc.

ImageWriter II: Specifications

Revised: 6/28/94
Security: Everyone

ImageWriter II: Specifications

=====

This article last reviewed: 29 September 1987

I. Technical Specifications

A. Printing Specifications:

1. Method: Impact dot matrix, logic seek (line by line)
2. Maximum Speed (characters per second at characters per inch):
 - a. Draft mode: 250 cps @ 10 cpi
 - b. Correspondence mode: 180 cps @ 10 cpi
 - c. Near Letter Quality mode: 45 cps @ 10 cpi
3. Maximum Line Length: 8 inches
4. Paper Feed Direction: Forward and reverse
5. Maximum Line Feed Speed: 24 lps @ 6 lpi
6. Paper Feed Method:
 - a. friction
 - b. friction/pin-feed
7. Ribbon:
 - a. Black ribbon
 - continuous fabric
 - 13 by 13000mm
 - Capacity: 2 million characters
 - b. Color ribbon
 - Four colors: magenta, cyan, yellow, black
 - continuous
 - 21 by 18000mm

B. Character Specifications:

1. Dot Matrices for each Character Format:

	dots wide	dots high
a. Standard:	7	8
b. Draft:	12	8
c. Near Letter Quality:	16	16
d. Custom:	16 max.	8 max.

-- Custom fonts are user-programmable and loaded down to the ImageWriter II.

2. Standard Character Sets:

- a. ASCII (alphanumeric and symbols): 96
- b. European language characters: 28
- c. Mouse Text characters: 32

3. Vertical Dot Spacing: 1/72 of an inch

4. Horizontal Pitches and Graphic Densities:

	Characters per inch	Characters per line	Dots per inch (approx)
a. 17	136	136	136
b. 15	120	120	120
c. 13.4	107	107	107
d. 12	96	96	96
e. 10	80	80	80
f. 9	72	72	72
g. Proportional-1	variable	160	160
h. Proportional-2	variable	144	144

5. Line Spacing:

- 1/144 to 99/144 of an inch
- selectable in increments of 1/144 of an inch

C. Paper Specifications

1. Width:

- 3.5 to 9.5 inches pin to pin (pin feed),
- 10 inches maximum

2. Thickness:

- 0.002 - 0.011 inch or 0.05 - 0.28 millimeters
- Original + 3 copies maximum

3. Types:

- a. Single sheets
- b. Pin-feed paper
 - 4.0 to 9.5 inches between hole centers

D. Power Specifications:

1. Options:

- a. American 120 VAC +/- 10%, 60 Hz; amp requirements (maximum

power utilization): 2 amps

b. Universal:

1. 100 VAC +/- 10%, 50/60 Hz
2. 120 VAC +/- 10%, 50/60 Hz
3. 140 VAC +/- 10%, 50/60 Hz
4. 200 VAC +/- 10%, 50/60 Hz
5. 220 VAC +/- 10%, 50/60 Hz
6. 240 VAC +/- 10%, 50/60 Hz

2. Consumption:

- a. Operating: 180 watts maximum
- b. Standby: 20 watts maximum

E. Interface Specifications:

1. Data Input Form: RS-232 8-bit asynchronous serial

- 1 start bit
- 8 data bits
- 1 stop bit (no parity)

2. Data Input Codes:

- a. Characters: ASCII, 8- or 7-bit
- b. Graphics: 8-bit binary

3. Transmission speeds: 300, 1200, 2400, or 9600 baud

4. Input Buffer Size: 2K bytes, 32K bytes with 32K Memory Option

5. Connections: Mini-circular connector, 8-pin socket or equivalent

6. Cable Connector: Mini-circular connector, 8-pin plug or equivalent

F. Physical Dimensions:

1. Weight: 25 pounds (11.36 kilograms)

inches millimeters

2. Width: 17.0 431.8

3. Height: 12.0 304.8

4. Depth: 5.0 127.0

G. Environmental Specifications:

1. Ambient Temperature:

Degrees

Fahrenheit Celsius

a. Operating: 50 to 104 10 to 40

b. Storage: -40 to +116 -40 to 40

2. Humidity:

- a. Operating: 20% to 95% relative humidity, noncondensing
- b. Storage: 10% to 95% relative humidity, noncondensing

3. Acoustics, Operating:

- 55 dBa maximum sound pressure at by-stander position
(as defined in American National Standard document
ANSI S1.29-1979)

Omnis: Printing Labels With ImageWriter

Revised: 11/20/87
Security: Everyone

Omnis: Printing Labels With ImageWriter

=====

This article last reviewed: 18 November 1987

To print labels from Omnis 3 or Omnis 3 Plus to any type of ImageWriter, you must set up the application to override form feeds. (It's not necessary to modify the printer driver.)

1. Go into Report Parameters and change the lines per page from the default value of 66 lpp to 0 lpp.
2. In the report layout, for every record, define the report to have as many lines as you desire on the label (at six lines per inch).
3. When setting label (page) size, make sure the size specified is the same distance from the top of one label to the top of the next.

Apple Personal Modem: Specifications (Discontinued)

Revised: 9/10/93
Security: Everyone

Apple Personal Modem: Specifications (Discontinued)

=====

I. Technical Specifications

A. FCC registration Number: BCG794-12381-DM-E

B. Ringer Equivalence Number: 0.4B

-- The total number of ringer equivalence numbers on any one telephone line may not exceed 5.0.

C. Self-test:

-- The modem executes a brief self-test when first powered up, and sounds a short "BEEP" if all tests pass. This test and response cannot be disabled.

D. Data format

1. Protocol: Asynchronous

2. Character Length:

a. 7 data bits:

1. Stop bits: 1 or 2

2. Parity: Odd, even, fixed: mark, space, or none

b. 8 data bits:

1. Stop bits: 1 or 2

2. No parity

4. Mode: Full duplex with echo back

E. Transmission speeds:

1. 1200 baud

a. Tolerance in character asynchronous format (DTE data rate):

1. Plus 1.0%

2. Minus 2.5 %

b. Tolerance in modulation rate: Plus or minus 0.01%

-- Frequency Shift Keying (FSK) signal modulation

2. 0-300 baud

-- Phase Shift Keying (PSK) signal modulation

-- Data and handshaking modes

-- Automatic adjustment to correct baud rate for receiving

-- Bell System Tech Reference 412145 - 103 / 212A modem specification

F. Interface: RS-232-C, with mini-circular 8-pin connector

G. Operating modes:

1. Auto or manual dial (including redial)

a. Tone: DTMF (Dual Tone Multi-Frequency - "Touch Tone")

1. Frequency tolerance: +/- 1/0%

2. Tone Balance: Within 3dB

b. Pulse (Rotary)

1. Dialing Rate: 10 pps

2. Dialing Duty Cycle = 40%/60% Mark/Break Ratio

2. Auto or manual answer

H. Receiver Dynamic Range: -10 to -45 dBm full duplex

I. Transmitter level:

-- -10dB, fixed

-- as per FCC Interconnect Specification, Part 68

J. Environmental specifications:

	Degrees	
	Fahrenheit	Celsius
1. Operating:	13 to 13	0 to 45
2. Storage:	-4 to 149	-20 to 65

K. Line monitoring:

1. Audio

-- Adjustable volume

2. Software

-- Prints status messages to computer

3. Visual

-- A single small indicator on the modem lights when the unit is

"on line", or communicating with another modem. It serves the function of a RS-232 DCD (Data Carrier Detect) status indicator.

L. Connectors:

1. Two RJ-11 modular telephone jacks

-- Either jack can be connected to the telephone line, since the modem internally configures itself when it detects the telephone system voltage so that the other jack can be used for a telephone set.

2. Detachable head AC plug

3. Mini-circular 8-pin jack

M. Compatibilty

1. Complete set of Hayes modem command instructions

II. System Configuration

A. Computer

1. Apple II, Apple II+, or Apple IIe

-- with Super Serial Card or compatible serial interface

2. Apple IIc with a serial number of 510,000 or lower

-- Contact Authorized Apple Dealer for information on a free upgrade.

3. Apple IIc with a serial number greater than 510,000

4. Apple III, Macintosh, Macintosh XL, or Lisa

5. A computer with an RS-232 port

B. Interface cable

-- Shielded cable from Apple (using any other type of cable might violate the FCC specification (Class B, Part 15)).

1. For Apple II, Apple II+, IIe, III, or Macintosh XL: 590-0331

2. For Apple IIc: 590-0332

3. For Macintosh = 590-0333

C. Standard single-line telephone outlet with RJ-11 modular jack

D. Appropriate communications software:

1. Access II
2. MacTerminal
3. Hayes-compatible programs

Apple Personal Modem: The commands and what they do

Revised: 8/3/89
Security: Everyone

Apple Personal Modem: The commands and what they do

=====

The Apple Personal Modem uses the Hayes instruction set--that is, the modem has a microprocessor inside it that controls all the functions of the unit. Any of the operating parameters, such as full/half duplex or number of rings before answer, can be set by a short command sequence; you can use similar command sequences for resetting and dialing. The modem also allows you to define certain text controls, such as line feed, carriage return, and escape characters, a very useful feature for defining specific terminal emulation for file transfer.

Command Instruction

AT	The command prefix
A	Answer command
A/	Again (repeat last) command
B	Balance (Transmit Carrier Level) command
C	Transmitter Carrier On / Off command
,	Pause (Value in S8 Register) command
D	Dial command
E	Local Echo (In Command Mode) command
F	Full Duplex (Local Echo in Data Mode) command
H	On-Hook (Terminate Call / Hang Up) command
I	Inquiry (Troubleshooting) command
M	Monitor Speaker command
O	On-Line (Used with +++ command)
P	Pulse Dialing Mode command
+++	Escape command
Q	Quiet (Response Codes) command
R	Reverse Mode (Originate to Answer Only) command
S	Set Register command (see following table)
;	Return to Command Mode
T	Touch-Tone Dialing Mode command
V	Verbalize (Verbal or Terse) Responses command
X	Extend Result Codes Set command
Z	Zap (Reset) command

Registers: Default

S0	Auto-Answer	
S1	Ring Counter	
S2	Escape Character	
S3	Carriage Return Character	
S4	Line Feed Character	
S5	Backspace Character	
S6	Initial Wait	
S7	Carrier Wait	30 seconds (range 1-255 seconds)
S8	Define Pause	
S9	Carrier Detect Response Time	0.6 seconds (non-adjustable)
S10	Disconnect Timing	
S11	Touch Tone Speed	
S12	Escape Code Guard Time	
S16	Self-Test Mode;	
	Analog Loopback Test

Hard Disk 20: Specification (Discontinued)

Revised: 9/14/93
Security: Everyone

Hard Disk 20: Specification (Discontinued)

=====

This article last reviewed: 27 September 1985

I. Technical Specifications

A. Storage Characteristics

1. Data Capacity: 20,769,280 Bytes (formatted)
2. Data Surfaces: 4
3. Heads per surface: 1
4. Blocks
 - a. Total: 39,040
 - b. Size: 532 bytes
 1. 512 bytes user data
 2. 20 bytes system data
5. Tracks
 - a. Per surface: 305
 - b. Spacing: 600 tracks per inch
6. Sectors
 - a. Per Track: 32
 - b. Per Surface: 9760

B. Drive Characteristics:

1. Average seek time: 85 milliseconds
2. Head-to-disk transfer rate: 7.5 million bits per second
3. Rotational speed: 2744 RPM
4. Drive startup time: 15 seconds

5. Drive spin-down time: 25 seconds

6. Stepper motor

C. Power Requirements:

1. Line voltage: 85 to 270 volts AC, RMS

2. Frequency: 47 to 64 Hz

3. Power: 30 watts

4. Amp requirements (maximum power utilization): 0.25 amps

D. Environmental Characteristics:

1. Temperature:

	Degrees	
	Fahrenheit	Celsius

a. Operating:	50 to 104	10 to 40
---------------	-----------	----------

b. Storing:	-104 to 122	-40 to 50
-------------	-------------	-----------

2. Relative Humidity: 20% to 80% (noncondensing)

3. Altitude: -1000 to 10,000 feet

E. Interface:

-- Transfer Rate: 500 Kilobits per second (serial)

1. DB-19 connector (to Macintosh External Disk Drive port)

2. Expansion port: DB-19 connector

-- Compatible with Macintosh external disk drive

F. Physical Specifications

1. Weight: 7 pounds (3.2 kilograms)

	inches	millimeters
--	--------	-------------

2. Width:	9.7	246
-----------	-----	-----

3. Height:	3.1	78.5
------------	-----	------

4. Depth:	10.5	266
-----------	------	-----

II. System Configuration

The Hard Disk 20 with Startup Disk can be used with any Macintosh 512K, Macintosh 512Ke, Macintosh Plus, or Macintosh SE.

Apple UniDisk 3.5: Specifications (Discontinued)

Revised: 9/13/93
Security: Everyone

Apple UniDisk 3.5: Specifications (Discontinued)

=====

Article Created: 27 Septemebr 1985

I. Technical Specifications

A. Recording Media:

1. Disk diameter: 3.5 inches
2. Recording surfaces: 2

WARNING: Disks used in UniDisk 3.5 must contain certified
DOUBLE-SIDED media.

3. Tracks per surface: 80

B. Capacities:

1. Formatted data: 800 kilobytes
2. Unformatted data: 1,246 kilobytes

C. Driver Characteristics:

1. Access Time:
 - a. Seek time (track to track): 6 milliseconds maximum
 - b. Settle time: 30 milliseconds maximum
 - c. Drive-motor start time: 600 milliseconds maximum
2. Transfer Rate: 500 Kilobits
3. Eject time: 2 seconds maximum

D. Power Consumption:

1. +12 volts

- a. Standby: 10 microamps
- b. Typical: 120 milliamps
- c. Peak: 600 milliamps during eject

2. +5 volts

- a. Standby: 170 milliamps
- b. Typical: 360 milliamps

E. Head Position Tolerance: Plus or minus 0.035 mm

F. Environmental Requirements:

1. Temperature:

	Degrees	
	Fahrenheit	Celsius
a. Operating:	40 to 120	5 to 50
b. Nonoperating:	40 to 140	-40 to 60

2. Humidity: 5% to 90%

- a. Maximum wet bulb temperature: 85 F, 29 C
- b. No condensation

G. Physical Dimensions:

	inches	millimeters
1. Length:	7.87	200
2. Width:	4.72	120
3. Height:	2.01	51

II. System Configuration:

A. Apple IIc

- A second UniDisk 3.5 can be plugged into the first
- An additional Disk IIc can be plugged into the first (or second) UniDisk 3.5

B. Apple II, Apple II Plus, Apple IIe

- With UniDisk 3.5 Apple IIe Accessory Kit
- A second UniDisk 3.5 can be plugged into the first.

Apple FORTRAN: Installing and using it on an Apple IIe

Revised: 10/21/85
Security: Everyone

Apple FORTRAN: Installing and using it on an Apple IIe

=====

To install Apple FORTRAN on an Apple IIe with 2 drives and 64K, you will need these diskettes:

1. FORTRAN diskettes:

- a. FORT1:
- b. FORT2:

2. Pascal diskettes:

- a. APPLE1:
- b. APPLE2:

--> Installing FORTRAN

1. Put APPLE1: in drive 1 and FORT1: in drive 2.
2. Turn on the Apple.
3. When the command line comes up, type F for Filer.
4. Type T for Transfer to transfer the following files from APPLE1: to FORT1:. Respond to the question Transfer what file?, by typing

APPLE1:?,FORT1:\$

Answer Y to the question to transfer files:

SYSTEM.APPLE
SYSTEM.PASCAL
SYSTEM.MISCINFO

5. Leave APPLE1: in drive 1.
6. Replace FORT1: with FORT2: in drive 2.

7. Type T for Transfer to transfer the following files from APPLE1: to FORT2:. Respond to the question Transfer what file?, by typing

APPLE1:?,FORT2:\$

Answer Y to the question to transfer files:

SYSTEM.EDITOR
SYSTEM.FILER
SYSTEM.CHARSET

8. Leave FORT2: in drive 2.

9. Replace APPLE1: with APPLE2: in drive 1.

10. Type T for Transfer to transfer the following file from APPLE2: to FORT2:. Respond to the question Transfer what file?, by typing

APPLE2:SYSTEM.LINKER,FORT2:\$

11. Leave FORT2 in drive 2.

12. Replace APPLE2: with FORT1: in drive 1.

13. Type T for Transfer to transfer the following files between FORT2: and FORT1:. Respond to the question Transfer what file?, by typing

FORT2:SYSTEM.LIBRARY,FORT1:\$
FORT1:FORTLIB.CODE,FORT2:\$

14. At the conclusion of the transfer process, FORT1: and FORT2: should contain the following files:

a. FORT1:

1. SYSTEM.APPLE
2. SYSTEM.PASCAL
3. SYSTEM.MISCINFO
4. SYSTEM.LIBRARY

b. FORT2:

1. SYSTEM.COMPILER
2. SYSTEM.LINKER
3. SYSTEM.EDITOR
4. SYSTEM.FILER
5. SYSTEM.CHARSET
6. FORTLIB.CODE1

You can check this by typing L for list, put FORT1: in drive 1 and FORT2: in drive 2. Respond to the question Dir listing of what vol? by typing

#4: (for drive 1)
#5: (for drive 2).

15. Make Backup diskettes. Refer to the Apple FORTRAN manual, page 159.

--> Using FORTRAN

1. Place FORT1: in disk drive #4: (slot 6, drive 1), and FORT2: in disk drive #5: (slot 6, drive 2). Please note at this point that diskette FORT1: will always be your boot or system diskette.

2. Turn on your Apple.

3. When the command line appears, type E to select the Edit option.

4. When this message appears:

```
>EDIT
NO WORKFILE IS PRESENT. FILE?  (<RET> FOR NO FILE <ESC-RET> TO EXIT)
```

Press RETURN for new file.

5. When this prompt line appears:

```
>EDIT: A(DJST C(PY D(LETE F(IND I(NSRT J(MP R(PLACE Q(UIT X(CHNG Z(AP
```

Type I for Insert.

6. When this prompt line appears:

```
>INSERT: TEXT[<BS> A CHAR, <DEL> A LINEII<EXT> ACCEPTS, <ESC> ESCAPES]
```

Type in this demo program starting with the FORTRAN comment line:

```
C FORTAN DEMO.
```

The format, punctuation, and spelling must be exactly as shown.

The indentation of the lines is important in FORTRAN. The indented lines must start in column seven.

```
          1          2
123456789012345678901234
C FORTAN DEMO
      DO 10 I = 1, 10
10    WRITE (*,'(I5)')I
      WRITE (*,'(I5)')I
      END
```

7. Type Control-C at end by holding down the control key first and typing C.

8. Type Q for Quit.

9. Type U to update the system work file

10. Now type R to Run the program

11. Respond to the question Listing File? by typing CONSOLE:

WARNING: If you are using Pascal 1.2, you will get an error message saying that the version numbers are incompatible. You must run the FORTRANFIX program.

To get the FORTRANFIX program, see the article FORTRAN: Using Fortran 1.0 with Pascal 1.2.

To use the FORTRANFIX program:

1. At the command line, type X for Execute.
2. Respond to the question, Execute what file? by typing
 - a. the volume name of the volume the program is on
 - b. one colon at the end of the volume name
 - c. the name of the program, FORTRANFIX
 - d. a carriage return

for example, FORT0:FORTANFIX<cr>

3. Follow the directions as they appear on the console.

Apple DMP: Connecting It With An IBM PC, XT, AT, PS/2

Revised: 11/9/88
Security: Everyone

Apple DMP: Connecting It With An IBM PC, XT, AT, PS/2

=====

This article last reviewed: 9 November 1988

To configure the Apple Dot Matrix Printer (DMP) with an IBM PC, use the standard IBM PC parallel interface and cable to the DMP with the standard switch settings. The Apple Dot Matrix Printer has a Centronics-style 36-pin parallel printer connector. This connector is also used on all IBM parallel printers manufactured for use with the IBM PC or PS/2 product lines.

The cable needed is the IBM Parallel Printer Cable, available from IBM authorized dealers.:

Switch 1	8	7	6	5	4	3	2	1
	0	0	0	0	0	0	0	0

Switch 2	8	7	6	5	4	3	2	1
	0	0	1	0			0	0

Key: 1 = Switch Closed; 0 = Switch Open

The DMP does not use the third and fourth switches on the second bank of switches; it doesn't matter how those two are set.

Use the IBM PC parallel interface compatible with Centronics printers.

IMPORTANT: You must clip off pin 16 on the DB-25 pin cable of the interface card. The printer will only print about one page and then start printing garbage if you don't clip off pin 16, which carries the signal Init Printer.

ProDOS and DOS from BASIC

Revised: 10/21/85
Security: Everyone

ProDOS and DOS from BASIC

=====

The following guidelines apply equally to DOS, the predecessor of ProDOS.

Using a ProDOS command from a BASIC program extends the capability of your programs in several ways. For example, you might use deferred execution ProDOS commands to automatically display a disk's catalog, to save a backup copy of records in a file, or to save an unfinished game so you can continue it later.

To use a ProDOS command from a program, use the BASIC statement PRINT followed by the string you want to print. In this case, the string will contain a ProDOS command. To indicate that you're printing a ProDOS command rather than text, type the control character CTRL-D as the first character of the string.

This is the general form:

```
PRINT CTRL-D "ProDOS command"
```

--> ProDOS and DOS from Integer BASIC

In Integer BASIC, there is only one way to get a CTRL-D into your program: type CTRL-D right after you type the quote marks that begin the string you want to print:

```
10 PRINT "CATALOG" (There is a CTRL-D between " and C.)
```

The CTRL-D is there, although you can't see it.

CAUTION: Using the right arrow key to copy a BASIC statement will NOT copy invisible control characters. In effect, the right arrow key deletes control characters.

--> ProDOS and DOS from Applesoft

To get a CTRL-D into your program with Applesoft, you can use (1) the method above, or (2) the Applesoft CHR\$ function in the expression CHR\$(4). "4" is the argument the CHR\$ function takes to return CTRL-D in a one-character ASCII string. Set any string variable to CHR\$(4) at the

beginning of your program and print that string variable before each ProDOS command. This gives you the advantage of seeing the CTRL-D in your code and the convenience of fixing it in only one place if you've declared it improperly. Using the variable in a PRINT statement, CTRL-D from a CHR\$ functions looks like this:

```
5 REM VALID ONLY WITH APPLESOFT
10 D$=CHR$(4)
20 PRINT D$;"CATALOG"
```

The string variable name is D as a reminder of the control character it contains.

You can omit the semicolon. The semicolon after D\$ is optional. When your program has many ProDOS commands in PRINT statements, you'll save typing time and memory space by omitting the semicolon. Without a semicolon, line 20 looks like this:

```
20 PRINT D$"CATALOG"
```

There are three things you should watch out for while using ProDOS commands from Applesoft programs

1. Be sure you have only one ProDOS command per PRINT statement
2. Be sure a carriage return is the last character printed before printing a CTRL-D. If the statement before a ProDOS command ends with a semicolon, a tab character, or a comma, the ProDOS command will not go to the ProDOS command interpreter. When your program unexpectedly prints a ProDOS command instead of executing it, look for a program statement that ends with a semicolon

If you set your D\$ variable to precede CTRL-D with a carriage return (i.e., 10 D\$=CHR\$(13)+CHR\$(4)), this D\$ WILL CAUSE PROBLEMS WHEN YOU WRITE OR APPEND TEXT, INTRODUCING UNWANTED CARRIAGE RETURNS.

3. Remember that some ProDOS commands work only in programs. The ProDOS commands that can be issued only in deferred execution are APPEND, OPEN, POSITION, READ, and WRITE.

Racal-Vadic VA212LC modem: Using it with Apple Computers

Revised: 2/10/93
Security: Everyone

Racal-Vadic VA212LC modem: Using it with Apple Computers

=====

Article Created: 21 October 1985

Article Change History

02/09/93 - UPDATED

- Racal-Vadic changed name to Racal Datacom.

Modem type:

AT&T 103/212A series; 1200 or 300 bps

Instruction set used:

None.

Hardware configuration:

Five front panel status indicators. Modem is answer-only, with external dial telephone needed to originate call. Control buttons on front select either voice or data mode/voice mode disables answer operation.

Software configuration:

No software controls for modem.

Interface type:

RS-232 DB-25S (DCE) connector, full or half duplex operation.

Modem interface packages, by computer:

Apple IIe (Super Serial card):

Access II or other terminal software; straight through DB-25 cable interface (serial card configured as DTE equipment) for hardware connection.

Apple IIc:

Access II or other terminal software; Apple IIc to Imagewriter cable with modem eliminator cable for hardware connection.

Apple III:

Access III or other terminal software; straight through DB-25 cable for hardware connection.

Macintosh:

MacTerm or other terminal software,;Macintosh to Imagewriter cable with modem eliminator cable for hardware connection.

Macintosh XL:

MacTerm or other terminal software; straight through DB-25 cable for hardware connection.

NOTE: This modem cannot originate calls - external telephone is needed if user wishes to dial out.

Racal-Vadic is now Racal Datacom.

Anderson Jacobson AJ 1259 modem: Using it with Apple Computers

=====

Modem type:

Vadic 3400 and AT&T 103/212A series; 1200 (2 modes), 0-300 bps.

Instruction set used:

None.

Hardware configuration:

Eight LED indicators and two switches on front panel give modem/data status and control modem functions. Telephone set is needed to originate calls using telephone for dialing. Once number has been dialed, modem is selectable to either high speed (Vadic 3400 or AT&T 212) or low speed modes.

Software configuration:

No command structure..

Interface type:

RS-232 DB-25S (DCE) connector, full or half duplex operation.

Modem interface packages, by computer:

Apple IIe (Super Serial card):

Access II or other terminal software; straight through DB-25 cable interface (serial card configured as DTE equipment) for hardware connection.

Apple IIc:

Access II or other terminal software; Apple IIc to Imagewriter cable with modem eliminator cable for hardware connection.

Apple III:

LaserWriter: Issues About Using It with a VAX

Revised: 3/4/90
Security: Everyone

LaserWriter: Issues About Using It with a VAX

=====

This article last reviewed: 6 January 1988

If you wish to use a LaserWriter as a spooled printer from a VAX 780, spooling PostScript files, here are some problems you may encounter:

When you connect the printer to the VAX, each PostScript file gets appended with an EOT character to reset the printer. The EOT is echoed by the printer to the VAX. The VAX sends back a BEL character, which is often in the midst of the next job's PostScript commands. The printer flags this modified command as an error and flushes the rest of the job. The reset EOT, at the end of that job, repeats the confusion.

If the EOT is omitted, the printer's Job Timeout period elapses and it sends error messages to the VAX's spooler, which further confuses it.

There is no way to suppress the printer's acknowledgement. From the PostScript Language Reference Manual: "Certain character codes serve special purposes, such as Control-D to mark end-of-file. The server performs a job by reading and executing a PostScript program from the serial channel. When it reads the end-of-file character and the program terminates, the server sends an end-of-file character, and ends the job, and starts a new one."

Q. Can the printer's timeout messages be suppressed?

A. The printer's timeout and job flush message is being generated by the LaserWriter in response to the Control-G from the spooler. The LaserWriter's PostScript command interpreter does not understand the Control-G and generates an error. And, unfortunately, the spooler does not know the printer is in a timeout/flush mode and continues to send data to the printer. Error messages from the LaserWriter are generated spontaneously and are directed to the standard output file and can not be suppressed.

Q. Is it possible to switch to and from the Diablo emulation mode via Postscript commands, or can an emulation program be download as part of a job?

A. Yes, you can change the LaserWriter into Diablo 630 mode from PostScript mode. Below is a short PostScript routine that places the LaserWriter into Diablo 630 emulation mode for the remainder of the job (until ^D is received). This is the same Diablo emulation that can be selected with the side-panel switch setting, except for one limitation: when Diablo mode is selected from software, the serial port remains sensitive to the seven control characters ^C^D^T^S^Q and CR,LF. Diablo 630 output uses some of these codes, so the potential for problems is fairly high.

The Diablo emulator has some limitations, such as portrait mode only. If you want to get landscape printing, to change the type size or lines-per-page, or to emulate some other daisywheel printer, search this database under POSTSCRIPT AND DAISYWHEEL EMULATOR to get a generalized PostScript program that provides a framework for building any daisywheel emulator.

```
--
%!
%PostScript code to call Diablo emulator from AppleTalk or serial input stream
% This code should go on the front of a Diablo file.
```

```
/doDiablo {/printpageflag false def
    {statusdict begin
        62 eescratch fontname
        61 eescratch dup 0 eq {pop 1} if fontname
        60 eescratch
        59 eescratch
                                /diablo load
    end
    exec
} stopped pop
printpageflag {showpage} if
    } def

/fontname {$idleTimeDict begin
    dup ROMnames length ge {pop 0} if
    ROMnames exch get
end
    } def
```

```
doDiablo
```

```
--
```

Q. The printer is connected via a serial 9600-baud line and may be shared by PCs via either a manual switch or a "smart" Logical connection printer sharer. Is there a better way to make this connection?

A. You may want to consider using DTR for the handshake, which eliminates the need for two-way communications with the LaserWriter. This way, the spooler can neither confuse nor be confused with extra control characters. To use DTR on the LaserWriter, the LaserWriter's ROMs must be rev 2.0.

LisaTest 2.2: Errors When Testing Macintosh Hard Disks

Revised: 11/9/88
Security: Everyone

LisaTest 2.2: Errors When Testing Macintosh Hard Disks

=====

This article last reviewed: 9 November 1988

Under the following situations, LisaTest 2.2 can't test a hard disk formatted for Macintosh software:

1. If a Macintosh-formatted hard disk is attached to the system when you startup LisaTest 2.2. (The system will hang.)
2. If you connect your Macintosh-formatted ProFile after booting LisaTest, and afterwards choose test ProFile. (Error message #3 is displayed.)

Two later releases of LisaTest fix this problem:

1. LisaTest Version 3.0, which can test Macintosh-formatted hard disks.
2. Macintosh XL/Lisa Modification Test Version 1.0, which can test Macintosh-formatted hard disks and contains the square pixel screen driver for use on those Lisas or Macintosh XLs that have the Macintosh XL Screen Kit installed in them.

Anchor Signalman Express modem: Using it with all Apples

=====

Modem type:

AT&T 103/212A series, 1200/300 bps.

Instruction set used:

Fully HAYES compatible.

Hardware configuration:

Eight LED indicators on front panel give modem and data status. Internal back-up battery provides RAM power for auto-dial number storage in memory. Modem runs off of external +12V plug in power supply. Built-in speaker with front panel volume control is used to monitor operation and diagnostics.

Software configuration:

Microprocessor controlled intelligent modem with number storage, auto-dial and auto-answer functions.

Interface type:

RS-232 DB-25S (DCE) connector, full duplex operation.

Modem interface packages, by computer:

Apple IIe (Super Serial card):

Access II or other terminal software; straight through DB-25 cable interface (with serial card configured as DTE equipment) for hardware connection.

Apple IIc:

Access II or other terminal software; Apple IIc to Imagewriter cable with modem eliminator cable for hardware connection.

Anderson Jacobson AJ 1212-AD1 modem: Using it with all Apples

=====

Article Created: 21 October 1985
Article Reviewed/Updated: 22 August 1994

TOPIC -----

This article describes the Anderson Jacobson AJ 1212-AD1 modem and how it can be used with a variety of Apple computers.

DISCUSSION -----

Modem type:
AT&T 103/212A series; 1200, 0-300 bps.

Instruction set used:
Proprietary Anderson Jacobson command control structure.

Hardware configuration:

Eight LED indicators and six switches on front panel give modem/data status and control modem fuctions and tests. Modem runs off of external plug-in power supply. Non-volatile memory retains stored numbers and configuration data. Built-in speaker is used to monitor operation and diagnostics.

Software configuration:

Microprocessor-controlled intelligent modem with stored number, auto-dial, and auto-answer functions.

Interface type:

RS-232 DB-25S (DCE) connector, full or half duplex operation.

Modem interface packages, by computer:

Apple IIe (Super Serial card):

Access II or other terminal software; straight through DB-25 cable interface
(with serial card configured as DTE equipment) for hardware connection.

Apple IIc:

Access II or other terminal software; Apple IIc to Imagewriter cable with modem
eliminator cable for hardware connection.

Apple III:

Access III or other terminal software; straight through DB-25 cable for hardware
connection.

Macintosh:

MacTerm or other terminal software; Macintosh to Imagewriter cable with modem
eliminator cable for hardware connection.

Macintosh XL:

MacTerm or other terminal software; straight through DB-25 cable for hardware
connection.

NOTE: Pull-down functions of MacTerm will not work, since they're Hayes
instruction set commands. Typing in the correct command will work,
though; refer to the modem commands provided in the user manual.

Datec PAL 212 modem: Using it with all Apples

Revised: 10/21/85
Security: Everyone

Datec PAL 212 modem: Using it with all Apples

=====

Modem type:

AT&T 103/212A series; 1200, 0-300 bps.

Instruction set used:

Limited implementation of the HAYES command set. Only the S0, S2 and S7 registers are used, as well as other abbreviations in the command control structure.

Hardware configuration:

Five LED indicators on front panel give modem and data status. Modem runs off of external plug-in power supply. Built-in speaker is used to monitor operation and diagnostics.

Software configuration:

Microprocessor controlled intelligent modem with auto-dial and auto-answer functions.

Interface type:

RS-232 DB-25S (DCE) connector, full or half duplex operation.

Modem interface packages, by computer:

Apple IIe (Super Serial card):

Access II or other terminal software; straight through DB-25 cable interface (serial card configured as DTE equipment). for hardware connection.

Apple IIc:

Access II or other terminal software; Apple IIc to Imagewriter cable with modem eliminator cable for hardware connection.

Apple III:

Access III or other terminal software; straight through DB-25 cable for hardware connection.

Macintosh:

MacTerm or other terminal software; Macintosh to Imagewriter cable with modem eliminator cable for hardware connection.

Macintosh XL:

MacTerm or other terminal software; straight through DB-25 cable for hardware connection.

Security: Everyone

Datec PAL 212SA modem: Using it with all Apples

=====

Modem type:

AT&T 103/212A series; 1200, 0-300 bps.

Instruction set used:

Fully HAYES compatible.

Hardware configuration:

Ten LED indicators on front panel give modem and data status. Internal memory allows up to 10 user phone numbers to be stored. Modem runs off of external plug-in power supply. Internal jumpers and switches allow the modem to be hard-wired to any specific configuration otherwise supported by the command set. Built-in speaker is used to monitor operation and diagnostics.

Software configuration:

Microprocessor controlled intelligent modem with number storage, auto-dial and auto-answer functions.

Interface type:

RS-232 DB-25S (DCE) connector, full or half duplex operation.

Modem interface packages, by computer:

Apple IIe (Super Serial card):

Access II or other terminal software; straight through DB-25 cable interface (serial card configured as DTE equipment) for hardware connection.

Apple IIc modem eliminator cable for hardware connection.

Apple III:

Access III or other terminal software;. straight through DB-25 cable for hardware connection.

Macintosh:

MacTerm or other terminal software; Macintosh to Imagewriter cable with

modem eliminator cable for hardware connection.

Macintosh XL:

MacTerm or other terminal software; straight through DB-25 cable for hardware connection.

Datec PAL 212SC modem: Using it with all Apples

=====

Modem type:

AT&T 103/212A series; 1200, 0-300 bps..

Instruction set used:

Fully HAYES compatible.

Hardware configuration:

Rack-mounted (up to 16 units per rack) or stand-alone modem has ten LED indicators on front panel that give modem and data status. Non-volatile memory for number and configuration data storage. Modem runs off of external or rack power supply. Built-in speaker is used to monitor operation and diagnostics.

Software configuration:

Microprocessor controlled intelligent modem with number storage, auto-dial and auto-answer functions.

Interface type:

RS-232 DB-25S (DCE) connector, full or half duplex operation.

Modem interface packages, by computer:

Apple IIe (Super Serial card):

Access II or other terminal software straight through DB-25 cable interface (serial card configured as DTE equipment) for hardware connection.

Apple IIc:

Access II or other terminal software; Apple IIc to Imagewriter cable with modem eliminator cable for hardware connection.

Apple III:

Access III or other terminal software; straight through DB-25 cable for hardware connection.

Macintosh:

MacTerm or other terminal software; Macintosh to Imagewriter cable with

modem eliminator cable for hardware connection.

Macintosh XL:

MacTerm or other terminal software; straight through DB-25 cable for hardware connection.

Datec PAL 212SD modem: Using it with all Apples

=====

Modem type:

AT&T 103/212A series; 1200, 0-300 bps..

Instruction set used:

Fully HAYES compatible.

Hardware configuration:

Rack-mounted (up to 16 units per rack) or stand-alone modem has ten LED indicators on front panel that give modem and data status. Password access control for security. Non-volatile memory for password, phone number, and configuration data storage. Modem runs off of external or rack power supply. Built-in speaker is used to monitor operation and diagnostics.

Software configuration:

Microprocessor controlled intelligent modem with password, number storage, auto-dial, and auto-answer functions.

Interface type:

RS-232 DB-25S (DCE) connector, full or half duplex operation.

Modem interface packages, by computer:

Apple IIe (Super Serial card):

Access II or other terminal software; straight through DB-25 cable interface (serial card configured as DTE equipment) for hardware connection.

MICROCOM MACMODEM 2400: Using it With All Apples

=====

Article Created: 21 October 1985

- Modem type:
AT&T 103/212A series; 2400, 1200, 300, 0-110 bps.
- Instruction set used:
Hayes compatible Macmodem software provides all modem control functions.
- Hardware configuration:
Six LED indicators on front panel give modem and data status. Modem plugs into Macintosh Communications port, and terminal software provides auto-dial number storage. Modem runs off of 17VAC plug in power supply. Built-in speaker is used to monitor operation and diagnostics.
- Software configuration:
Computer controlled intelligent modem with number storage, auto-dial and auto-answer functions.
- Interface type:
Macintosh DB-9 connector, full duplex operation.

Modem interface packages, by computer:

- Apple IIe:
Not useable.
- Apple IIc:
Not useable.
- Apple III:
Not useable.
- Macintosh:
MICROCOM MACMODEM terminal software, with the modem providing the cable for hardware connection.

- Macintosh XL:
MICROCOM MACMODEM terminal software, with a DB-9 to DB-25 adapter needed to connect the modem cable to the Macintosh XL port for hardware connection.

Penril AD 300/1200 modem: Using it with all Apples

=====

Modem type:

AT&T 103/212A series; 1200, 300, 0-110 bps.

Instruction set used:

Fully HAYES or PENRIL Auto-Dialer compatible.

Hardware configuration:

Eight LED indicators on front panel give modem and data status. Auto-dial sequence, phone number, and log-on macro storage in RAM memory. Modem runs off of external plug in power supply.

Software configuration:

Microprocessor controlled intelligent modem with number storage, macro sequence, auto-dial, and auto-answer functions.

Interface type:

RS-232 DB-25S (DCE) connector, full or half duplex operation.

Modem interface packages, by computer:

Apple IIe (Super Serial card):

Access II or other terminal software; straight through DB-25 cable interface (serial card configured as DTE equipment) for hardware connection.

Apple IIc:

Access II or other terminal software; Apple IIc to Imagewriter cable with modem eliminator cable for hardware connection.

Apple III:

Access III or other terminal software; straight through DB-25 cable for hardware connection.

Macintosh:

MacTerm or other terminal software; Macintosh to Imagewriter cable with modem eliminator cable for hardware connection.

Macintosh XL:

MacTerm or other terminal software; straight through DB-25 cable for hardware connection.

Prometheus ProModem 1200: Using it with all Apples

=====

Modem type:

AT&T 103/212A series; 1200 or 0-300 bps.

Instruction set used:

Fully HAYES compatible.

Hardware configuration:

Twelve LED characters and eight LED indicators on front panel give call, modem, and data status. Internal back-up battery provides back-up power for clock/calender, modem configuration, and auto-dial number storage in memory. Modem runs off of 117VAC, 60 Hz.

Software configuration:

Microprocessor controlled intelligent modem with clock / calender set, help menu, number storage, auto-dial, and auto-answer functions.

Interface type:

RS-232 DB-25S (DCE) connector, full or half duplex operation.

Modem interface packages, by computer:

Apple IIe (Super Serial card):

Access II or other terminal software; straight through DB-25 cable interface (serial card configured as DTE equipment) for hardware connection.

Apple IIc:

Access II or other terminal software; Apple IIc to Imagewriter cable with modem eliminator cable for hardware connection.

=====

Modem type:

AT&T 103/212A series; 1200, 300, 0-110 bps.

Instruction set used:

HAYES command set compatible with terminal emulator firmware on card.

Hardware configuration:

Plug-in modem board for the Apple II, IIe series computers. Built-in speaker is used to monitor operation and diagnostics.

Software configuration:

Microprocessor controlled intelligent modem with internal ROM terminal emulator firmware (addressing card initiates program), auto-dial, and auto-answer functions.

Interface type:

RJ-11 four telephone interface (two provided).

Modem interface packages, by computer:

Apple II+ or IIe:

Built-in terminal software; RJ-11 telephone cable interface (two provided-- one for user telephone) for hardware connection

Apple IIc:

Not useable.

Apple III:

Not useable.

Macintosh:

Prometheus ProModem 1200M: Using it with all Apples

=====

Modem type:

AT&T 103/212A series; 1200 or 0-300 bps.

Instruction set used:

Fully HAYES compatible with ProCom-M Macintosh software package.

Hardware configuration:

Twelve LED characters and eight LED indicators on front panel give call, modem, and data status. Internal back-up battery provides back-up power for clock / calender, modem configuration, and auto-dial number storage in memory. Modem runs off of 117VAC, 60 Hz. Same as Prometheus ProModem 1200 except for added cable and software.

Software configuration:

Microprocessor controlled intelligent modem with clock / calender set, help menu, number storage, auto-dial, and auto-answer functions.

Interface type:

RS-232 DB-25S (DCE) connector, full or half duplex operation. Special cable provided for Macintosh interface.

Modem interface packages, by computer:

Apple IIe (Super Serial card):

Designed for Macintosh. See Prometheus ProModem 1200.

Apple IIc:

Designed for Macintosh. See Prometheus ProModem 1200.

Apple III:

Designed for Macintosh. See Prometheus ProModem 1200.

Macintosh:

ProCom-M terminal software; Macintosh to ProModem 1200M cable provided for hardware connection.

Macintosh XL:

ProCom-M terminal software; Macintosh to ProModem 1200M cable provided for hardware connection. DB-9 to DB-25 cable adapter needed for connection.

Prometheus 300C modem: Using it with all Apples

=====

Modem type:
AT&T 103 series; 300 bps.

Instruction set used:
Fully HAYES compatible.

Hardware configuration:
Plug-in modem designed to attach to the rear of the Apple IIc. Powered by the Apple IIc. Built-in speaker allows data and modem status monitoring.

Software configuration:
Microprocessor controlled intelligent modem with number storage, auto-dial and auto-answer functions.

Interface type:
RJ-11 telephone interface.

Modem interface packages, by computer:

Apple IIe (Super Serial card):
Apple IIc only.

Apple IIc:
ProCom-A terminal interface software provided with modem--direct attachment to rear of Apple IIc case.

Apple III:
Apple IIc only.

Macintosh:
Apple IIc only.

Macintosh XL:
Apple IIc only.

Racal-Vadic 1200V modem: Using it with all Apples

=====

Article Created: 21 October 1985

Article Change History

02/09/93 - UPDATED

- Racal-Vadic changed name to Racal Datacom.

Modem type:

AT&T 103 / 212A series; 1200 or 300 bps

Instruction set used:

Maxwell 'GEORGE' or HAYES command and instruction sets.

Hardware configuration:

One front panel status indicator. All status and command responses are on the user's screen. Very similar to the Apple Modem 1200 in both operation and function.

Software configuration:

Microprocessor controlled intelligent modem with auto-dial and auto-answer functions.

Interface type:

RS-232 DB-25S (DCE) connector, full or half duplex operation.

Modem interface packages, by computer:

Apple IIe (Super Serial card):

Access II or other terminal software; straight through DB-25 cable interface (serial card configured as DTE equipment) for hardware connection.

Apple IIc:

Access II or other terminal software; Apple IIc to Imagewriter cable with modem eliminator cable for hardware connection.

Apple III:

Access III or other terminal software; straight through DB-25 cable for hardware connection.

Macintosh:

MacTerm or other terminal software; Macintosh to Imagewriter cable with modem eliminator cable for hardware connection.

Macintosh XL:

MacTerm or other terminal software; straight through DB-25 cable for hardware connection.

NOTE:

Pull-down functions of MacTerm will not work as they are Hayes instruction set commands. Keying in the correct command will work--refer to the modem commands provided in the user manual.

Racal-Vadic is now Racal Datacom.

EtherTalk Card: Pinouts

Revised: 7/1/92
Security: Everyone

EtherTalk Card: Pinouts

=====

Article Created: 18 November 1987
Article Last Reviewed: 25 June 1992
Article Last Updated:

TOPIC -----

What are the pinouts of the Apple EtherTalk Card?

DISCUSSION -----

The EtherTalk Card conforms to the physical media standards set forth in the IEEE 802.3 specification. It also conforms to the pinout specifications of Ethernet transceiver cables set forth in "The Ethernet" standards published by Digital, Intel, and Xerox -- the original developers of Ethernet. Standard Ethernet cabling works just fine.

Here are the pinouts for Ethernet thick cabling:

1 - Shield	9 - Collision Presence (-)
2 - Collision Presence (+)	10 - Transmit (-)
3 - Transmit (+)	11 - Reserved
4 - Reserved	12 - Receive (-)
5 - Receive (+)	13 - Power
6 - Power Return	14 - Reserved
7 - Reserved	15 - Reserved
8 - Reserved

Multiplan: Why Some File Names Don't Appear in Scrolling Window

=====

This article last reviewed: 27 January 1988

Microsoft Multiplan, versions 1.0, 1.01, and 1.02, have no inherent limit as to the NUMBER of names that they hold, only the SIZE of the name file. That is, many small names will store as well as a shorter list of long names -- up to the limit of available memory.

Under some high memory-use conditions, however, the Name scroll-box or the Link scroll-box can hold only the FIRST 45 NAMES. The rest are there, and remain active, but the scroll-box will only show the first 45.

ASCII Control Characters

Revised: 11/7/88
Security: Everyone

ASCII Control Characters

=====

This article last reviewed: 1 November 1988

Code sets provide a means of electronically expressing and communicating characters. There are three types of characters:

1. Alphabetic characters are the letters of the alphabet and special characters like <, *, @, ?, ", etc.
2. Numeric characters are numbers.
3. Control characters are unique characters that communicate specific functions (e.g., form feed, carriage return, escape, etc.) to a receiving unit.

Each character in a code set is expressed by a unique binary code. Morse code is an example of a code set. Each Morse character has a unique combination of dots and dashes that equate to the ones and zeros in a binary code.

Most people understand alphabetic and numeric characters. However, many people are not as familiar with control characters, so the following discussion will explain the control characters in more detail.

ASCII Control characters are used for five main functions:

1. COMMUNICATION CONTROL FUNCTIONS - SOH, STX, ETX, EOT, ENQ, ACK, NAK, DLE, SYN, ETB
2. CODE EXTENSION FUNCTIONS - Shift Out, Shift In, Escape
3. FORMAT EFFECTOR FUNCTIONS - Backspace, Tabs, Line Feed, Form Feed, Carriage Return
4. INFORMATION SEPARATOR FUNCTIONS - File Separator, Group Separator, Record Separator, Unit Separator

5. APPLICATION-DEFINED FUNCTIONS - Device Control 1 through 4, Bell

1. Communication Control Functions

These characters are mainly used in synchronous transmission character oriented protocols (such as Bisynchronous).

Since data communication between personal computer systems is usually asynchronous, we won't discuss the function of these characters here.

2. Code Extension Function

Code extension (ce) characters such as escape <ESC> are embedded in text to enable devices to recognize device-specific control codes not included in the code set.

The most commonly used ce character is <ESC>. It notifies a receiving unit that the character or characters following it are to be interpreted as a control code. A sequence of characters that starts with an <ESC> and makes up a control code is popularly called an "escape sequence."

For example, it might be desirable that a printer change the size of characters in the middle of a printing job. Since this function is not common to all types of equipment, an ASCII control character has not been assigned for it. Therefore many printer manufacturers have had to create escape sequences for this purpose.

When a printer receives and recognizes the ESC character, it interprets the following characters (up to the next RETURN character) as a control code, and (in our example) changes its print size accordingly.

Escape sequences are manufacturer-specific, so different devices may have different control codes to accomplish the same function (although there are ANSI standards which many conform to).

3. Format Effector Function

Format effector (FE) characters (for instance, carriage returns, line feeds) are embedded in the text sent to output devices like printers, CRT terminals, etc. These characters give these devices instructions on how to physically format the text when it is output.

4. Information Separator Function

Information separator (IS) characters allow the receiving unit to group the received data into a database hierarchy (file to group to record to unit, etc.).

5. Application-Defined Function

After all of the desired characters for a code set have been defined, there may be several codes (unique combinations of bits) left over. These codes are available for whatever purpose the designer may wish to assign them.

..TIL01373-ASCII_Control_Characters_(TA30410).pdf

For example, in ASCII the DC1 and DC3 (Device Control) application defined codes are often used to start and stop data in the XON/XOFF flow control protocol (for more info on flow control protocols search on HTS and flow control).

Seven-Bit or Eight-Bit ASCII

Revised: 11/7/88
Security: Everyone

Seven-Bit or Eight-Bit ASCII

=====

This article last reviewed: 1 November 1988

Each character in the ASCII code set is transmitted as a unique eight bit binary code.

The ASCII standard doesn't actually define the eighth bit of the code, so many vendors in the industry have recognized two kinds of ASCII: eight bit ASCII and seven bit ASCII with a parity bit (a transmission-error-detecting scheme).

The first seven bits of a character are the same for seven bit or eight bit ASCII; only the purpose of the eighth bit will change.

Eight bit ASCII has the eighth bit permanently assigned to a constant binary one or zero state.

Seven bit ASCII uses the eighth bit as a parity bit. This means that the eighth bit indicates the odd or even status of the sum of the seven bits in the character.

If the transmitting station has selected seven bit even parity, then for every character in which the sum of the lower seven bits (the real ASCII character) is odd, the transmitting station will make the eighth bit a 1. This makes the sum of all eight bits in the character even.

If the sum of the lower seven bits is already even, the transmitting station will leave the eighth bit a 0 so that the sum of the character will stay even.

The receiving station's equipment will check the sum of each character received to see that it is even. If it isn't, the receiving station's equipment will detect an error in data transmission.

Selecting eight bit ASCII, no parity, causes the transmitting station not to generate parity bits and the receiving station not to check parity. In this case a transmission error would not be detected by the equipment even if one occurred.

Flow Control Protocols (XOn/XOff or DTR)

Revised: 11/7/88
Security: Everyone

Flow Control Protocols (XOn/XOff or DTR)

=====

This article last reviewed: 1 November 1988

Data is usually transmitted much more rapidly than it can be processed. This is why devices allocate memory to buffer space. Buffers are used to collect the received data as it comes in. However, many transmissions are quite a bit larger than the buffer space allocated. What is needed is a way for the receiving station to tell the transmitting station to stop and start transmitting as its buffer fills and is emptied. This is the purpose of flow control protocols.

We'll discuss the two most popular methods of flow control used in personal computer systems.

1. XON/XOFF - is a very popular method of flow control between asynchronous full duplex devices (for more info on asynchronous data transfers search on HTS and Asynchronous; for more info on full duplex search on HTS and Duplex). In full duplex, both communicating devices can send each other data at the same time. When the receiver's buffer starts getting too full, it sends an XOFF (which is most often an ASCII DC3 character; for more information on ASCII control characters search on HTS and ASCII Control Characters). The Transmitter sees the XOFF and stops its transmission. When the receiver is ready for more data it sends the transmitter an XON (most often an ASCII DC1 character). The transmitter sees the XON and resumes transmission. This process goes on until the transmission is complete.

2. DTR (also called hardware handshaking) - can be used in full or half duplex RS232 communications. DTR is an RS232 control signal which normally indicates that a DTE device is online (for more info on DTEs and DCEs, search on HTS and RS232). However, many manufacturers use it for flow control. When the receiver's buffer starts getting too full, it turns off its DTR signal. The transmitter stops sending data. When the receiver is ready for more data it turns its DTR back on. The transmitter resumes transmission. This process goes on until the transmission is complete.

RS-232: DTEs, DCEs and Pin Signal Sequences

Revised: 11/7/88
Security: Everyone

RS-232: DTEs, DCEs and Pin Signal Sequences

=====

This article last reviewed: 1 November 1988

NOTE: Throughout this discussion acronyms will be used in place of full names. Since all knowledgeable data communications personnel use these acronyms, you should practice using them.

DTE and DCE

According to the RS-232 standard, all devices involved in data communications can be classified into two groups:

DTE - Data Terminal Equipment: those devices that originate the data or are its final destination. Examples would be computers, printers, tape drives, etc.

DCE - Data Communications Equipment: those devices whose function it is to communicate the data between the DTEs. Examples would be modems, data multiplexers, and digital service units.

The RS-232 cabling between a DTE and a DCE is straight through. That is, pin 1 from the male DTE connector goes to pin 1 on the female DCE connector, pin 2 goes to pin 2, and so on. If a pin is an output for a DTE, then it is an input for a DCE (and vice versa).

RS-232 PIN GROUPS (three main groups)

1. CONTROL pins carry signals that indicate and control the state of the DTE/DCE interface.
2. DATA pins carry data signals.
3. CLOCK pins carry the clock signals necessary for synchronous data communications.

Because Half Duplex has to control line direction, it requires more RS-232 pins. The following is the sequence of RS-232 signals which are usually used for Half Duplex.

HALF DUPLEX SIGNAL SEQUENCE

Sequence	Pin	Full Signal Name	Output From	Input To
(1)	20	Data Terminal Ready (DTR)	DTEs	DCEs
(2)	6	Data Set Ready (DSR)	DCEs	DTEs
(3)	4	Request to Send (RTS)	Tx DTE	Tx DCE
(4)	8	Rx'd Line Sig Detect (DCD)	Rx DCE	Rx DTE
(5)	5	Clear to Send (CTS)	Tx DCE	Tx DTE
(6)	2	Tx Data (TD)	Tx DTE	Tx DCE
(7)	3	Receive Data (RD)	Rx DCE	Rx DTE
Constant	7	Signal Ground (SG)	n/a	n/a

Fortunately, most Apple products use Full Duplex and so require fewer pins. The following is the sequence of RS-232 signals which are often used for Full Duplex.

FULL DUPLEX SIGNAL SEQUENCE

Sequence	Pin	Full Signal Name	Output From	Input To
(1)	20	Data Terminal Ready	DTEs	DCEs
(2)	6	Data Set Ready	DCEs	DTEs
(3)	2	Tx Data	Tx DTE	Tx DCE
(3)	3	Receive Data	Rx DCE	Rx DTE
Constant	7	Signal Ground	n/a	n/a

Full Duplex And Half Duplex And Echoplex

Revised: 11/10/88
Security: Everyone

Full Duplex And Half Duplex And Echoplex

=====

This article last reviewed: 1 November 1988

NOTE: Throughout this discussion both terminals and personal computers running terminal emulator software will be referred to as terminals. The term modem denotes any DCE device.

BANDWIDTH

The wires used to connect the average telephone to the American telephone system can be viewed as a river with information barges on it. The river's width is limited and cannot be made wider. Similarly, the telephone wire has a limited frequency bandwidth.

FULL DUPLEX (for modems and other data transmission devices)

A Full duplex modem can simultaneously transmit and receive on a connection. In other words, the river is divided into two channels in which information barges may travel in both directions at the same time. But some maneuvering room is required on either side of both barges to prevent collisions. This is also true of the telephone line; some of the bandwidth is needed to separate the transmit and receive channels. This space is then wasted and cannot be used to carry information. As a result in most full duplex modems have relatively slow data transmission rates.

HALF DUPLEX (for modems and other data transmission devices)

Half duplex modems, on the other hand, use almost the entire bandwidth and so waste very little space. But because there is not then room for two channels, the information may only move one direction at a time. This means that time must be taken after each transmission to "turn around" the line, and extra interface signals are required to control which station is transmitting.

ECHOPLEX

Echoplex is a feature designed into many modems. It enables the modem to reflect characters back to the terminal it serves, even while transmitting them to the phone line (if a phone connection has been made). With echoplex, a user can see whether his computer is communicating to the modem simply by typing a few characters. If the modem has the echoplex feature (Apple modems

do), then the modem will return the typed characters to the screen. This tells the user that the data has transferred from the terminal to the modem without error.

TERMINAL FULL AND HALF DUPLEX

Sometimes terminals (and terminal emulator software such as Access III) have options for terminal full-duplex or terminal half-duplex to allow the terminals to support modems both with and without echoplex.

TERMINAL HALF DUPLEX

Terminal half duplex supports non-echoplex modems. This selection on a terminal causes the characters typed to be displayed regardless of whether or not the modem returns the characters.

If terminal half duplex is selected when using an echoplex modem, there will be two of every character typed: one from the terminal's keyboard and one from the modem.

If the modem doesn't have echoplex, it won't echo characters back to the terminal. So the only way the user can see what is being typed is if terminal half duplex is selected.

TERMINAL FULL DUPLEX

Terminal full duplex causes the terminal to display only the characters received from the modem (which may be those the modem has received from a remote modem accross a phone connection as well as those the modem is echoing back to the terminal).

NOTE: Many people think that selecting terminal full duplex means that full duplex communication will occur across the phone connection, modem-to-modem, but this is not so. Actually the terminal full duplex option is there only to enable the terminal to support an echoplex modem.

Terminal Full Duplex enables the user to check communication between the terminal and the echoplex modem by allowing him to ensure that the characters displayed are the same as those typed.

If terminal full duplex is used with a modem or other device that does not perform echoplex, then the user will not be able to see what is typed because the characters will not be echoed back.

The table below shows the indications that will occur when the wrong terminal duplex selection is made at a terminal.

"SYMPTOM"	"PROBLEM"
CHARACTERS TYPED ARE NOT DISPLAYED WITH ECHOPLEX MODEM	MODEM NOT FUNCTIONING OR NOT CONNECTED
CHARACTERS TYPED ARE NOT DISPLAYED WITH NON-ECHOPLEX MODEM	TERMINAL SHOULD BE IN HALF DUPLEX
TWO OF EVERY CHARACTER TYPED IS	TERMINAL SHOULD BE IN FULL DUPLEX

DISPLAYED

BECAUSE MODEM IS ECHOPLEX

RS232 Modem Eliminator Cables

Revised: 11/18/93
Security: Everyone

RS232 Modem Eliminator Cables

Article Reviewed/Updated: 18 November 1988

NOTE: The following discussion describes the pin crossover process necessary to produce a cable type modem eliminator. There are also electronic devices called modem eliminators. These devices do not necessarily perform the same function as a modem eliminator cable.

NOTE: For reasons specific to their applications, some interfaces use other pins than those we discuss here. You should be aware that there are a lot of different pin configurations out there.

Modem eliminator cables are designed to rectify the problems that occur when two RS232 DTEs are connected directly, without intervening DCEs.

RS232 was originally designed for DTE to DCE communications.

DTE to DCE cable connections are pin to pin (pin 1 of the DTE is connected straight through to pin 1 on the DCE, 2 to 2, etc.).

However, most devices (except modems) installed locally (e.g., personal computers and printers in the same room) are DTEs, and DTEs won't communicate when connected by a straight through cable.

Here is one reason why: Data Terminal Ready (pin 20) (which tells the DCE that the DTE is online) is an output from the DTE and an input to the DCE. If two DTEs were connected with a straight through cable, the DTR output from the first DTE would go straight to the DTR input of the second DTE. Besides not working, this could also cause problems in the interface electronics.

Similarly, Data Set Ready (pin 6) is an output from the DCE and an input for the DTE. If two DTEs are trying to communicate with a straight through cable, the DSR input from the first DTE would go to the DSR input of the second DTE. Connected like this, neither DTE would output a signal onto the pin, so neither would know if its connected device was online.

Other pins cause similar problems in straight-through DTE connections.

So you can see that the RS232 interfaces of two DTEs are not compatible if connected with a straight-through cable and no intervening DCEs.

A modem eliminator cable simply jumpers signals from the pins of one DTE connector to compatible pins on the other, so that each DTE interface thinks it's talking to a DCE interface. Let's look at a typical signal exchange below.

1. DTE #1 raises DTR on pin 20. The modem eliminator jumpers DTR from pin 20 of DTE #1's connector (a DTE output) to DSR on pin 6 of DTE #2's connector (a DTE input).

We'll assume that DTE #2 was already on, so DTR on pin 20 of its connector was already active and DTE #2 is expecting a DSR from its DCE. DTE #2 sees the DTR from DTE #1 as the expected DSR.

The modem eliminator also jumpers DTR from pin 20 of DTE #2 to pin 6 of DTE #1 so that DTE #1 believes that its DCE is on-line too.

2. The modem eliminator routes TD (Transmit Data) from pin 2 (a DTE output) of each DTE to the opposite connector's RD (Receive Data) on pin 3 (a DTE input).

3. When a DTE wants to transmit, it simply shifts data out onto TD (pin 2) of its connector.

The modem eliminator cable routes the data to the RD on pin 3 of the destination DTE. Of course, in basic full duplex both DTEs may do this at the same time without the need for any other control signals.

HALF DUPLEX

In Half Duplex communications, Request to Send (pin 4), Clear to Send (pin 5), and Data Carrier Detect (properly called Received Line Signal Detect, pin 8) are required to control the direction of transmission. Some modem eliminators have these pins jumpered as well to accomodate local connection of "Half Duplex" DTE devices.

NOTE: When troubleshooting an RS-232 problem, it is always a good idea to check the connectors on the DTE and DCE to find out which signal pins are used. Then read the documentation to determine how they are being used. If it turns out that pins are connected but not used by the device, then those pins should be disconnected.

RS-232 Marks/Spaces and Cable Length/Grounding

Revised: 11/7/88
Security: Everyone

RS-232 Marks/Spaces and Cable Length/Grounding

=====

This article last reviewed: 1 November 1988

MARKs and SPACEs

All RS-232 signals (except grounds) will be above + 3 volts or below - 3 volts (commonly + or - 12 volts). The area between + 3 volts and - 3 volts is called the transition region.

No RS-232 signal (excluding ground) should ever be stationary at a voltage in the transition region. If one is found between + 3 volts and - 3 volts, it is a definite indication of a problem.

A high RS-232 voltage (between + 3 volts and + 25 volts) is called a SPACE.

A low voltage (between - 3 volts and - 25 volts) is called a MARK.

All Control and Clock signals are SPACEs when ON and MARKs when OFF.
All Data signals are SPACEs when a logic ZERO and MARKs when a logic ONE.

CABLE LENGTH

One of the problems in an RS-232 installation is determining the length of cable to be used. This is because capacitance increases with cable length and increased capacitance can eventually degrade the signal to the point where it will cause the loss of data integrity.

The RS-232 standard very conservatively recommends that the maximum length of cable be 50 feet (unless special low capacitance cable is used) and that its total capacitance be limited to 2500 uf or less. However, this length can usually be doubled, tripled, and more depending on the BPS rate (the higher the BPS rate used, the shorter the cable may have to be).

If a cable is over 50 feet and a length problem is suspected, try using a lower BPS rate. If the problem goes away, then try using a shorter or lower capacitance cable at the higher data rate. If the problem doesn't reappear then it must have been the longer cable.

CABLE GROUNDING

If long cables (over 50 feet) are used, the cable should be shielded. In this case the shield, SG (pin 7), and CG (pin 1) should be grounded to the chassis on only one side of the interface (either the DTE or DCE).

NOTE:

For flow control explanation search on HTS and FLOW CONTROL.

EXPLANATIONS

ADD LINE FEED AFTER CARRIAGE RETURN is used when the device sending data to the printer is not already sending a carriage return after every line of data (check application software on computer or interface PCB DIP switch positions). If the device is already sending a carriage return after every line, setting this

..TIL01380-ImageWriter_DIP_Switch_Settings_2-95_(TA30460).pdf

switch will cause the ImageWriter to generate a line feed, resulting in two carriage returns after every line.

ImageWriter PROBLEM/CURE: Prints Garbage After 1/4 Page

Revised: 1/30/92
Security: Everyone

ImageWriter PROBLEM/CURE: Prints Garbage After 1/4 Page

=====

This article last reviewed: 28 April 1988

PROBLEM DESCRIPTION: ImageWriter prints OK during Self Test. When a Macintosh is used with certain software, the first several lines also print OK, but after about a quarter of a page is printed, the ImageWriter pauses, and then prints garbage.

CAUSE: The application may be using DTR handshaking flow control protocol (for more info search on HTS and FLOW CONTROL). If so, it needs pin 20 DTR from the IW to be connected to pin 7 on the Mac.

CURE: Check the cable for 5 pins. If it doesn't have 5 pins, chances are DTR from the IW is not connected to the Mac so the application doesn't know when the IW's print buffer has filled. If the cable doesn't have 5 pins, obtain cable P/N 590-0169. Also confirm that IW DIP switch SW2-3 is open to select DTR handshake. If problem still not found, search on ImageWriter General Troubleshooting.

ImageWriter: Continously Prints Us During Self Test

Revised: 11/7/88
Security: Everyone

ImageWriter: Continously Prints "U"s During Self Test

=====

This article last reviewed: 01 November 1988

PROBLEM DESCRIPTION: The ImageWriter continuously prints the character "U" when print is initiated by Self Test.

CAUSE: Possible software problem or malfunctioning power supply regulator transistor.

CURE: 1. Power off IW, disconnect it from the computer, then press form feed while you turn it back on. This should cause the printer to perform its SELF TEST (a standalone printout of character sets). If it is a software problem, the power on reinitialization will cure it and the SELF TEST printout will occur. If it's a hardware problem Us will be printed during the SELF TEST. If the latter is the case, go to step 2.

2. Replace transistor assembly 970-0082. If problem is still not found, search on ImageWriter General Troubleshooting.

ImageWriter PROBLEM/CURE: Head Buzzes in Home Position

Revised: 1/30/92
Security: Everyone

ImageWriter PROBLEM/CURE: Head "Buzzes" in Home Position

=====

This article last reviewed: 28 April 1988

PROBLEM DESCRIPTION: When the ImageWriter is turned on, the power light comes on and the carriage moves to the left, but the select light doesn't come on. The head may vibrate or "buzz" in the home position. Pushing the select button has no effect. Closer inspection shows that the carriage cannot be moved as far to the left as it should be.

CAUSE: The detector plate located below the front guide rail on the left side of the ImageWriter is misaligned or malfunctioning.

CURE: Inspect the detector plate. If it is not straight, adjust it and clean it. You will need a small Phillips screwdriver to do this. If the adjustment does not help, remove the top cover of the ImageWriter and replace the sensor assembly. If problem still not found, search on ImageWriter General Troubleshooting.

ImageWriter PROBLEM/CURE: No Select Light

Revised: 1/30/92
Security: Everyone

ImageWriter PROBLEM/CURE: No Select Light

=====

This article last reviewed: 28 April 1988

BEFORE YOU START: Familiarize yourself with the ImageWriter Technical Procedures. Be sure to follow proper ESD procedures.

#1 - PROBLEM DESCRIPTION: When powered on the ImageWriter SEL lamp does not come on.

CAUSE: The magnetic cover interlock may be malfunctioning.

CURE: Check the magnet on the cover and the switch in the printer body to see that they are installed securely and aligned properly. If they are, replace the switch.

#2 - PROBLEM DESCRIPTION: The ImageWriter prints one line, returns to the left margin and the printer deselects. If the Select switch is pressed the printer prints another line, returns to the left and the printer deselects again.

CURE: The right margin switch is causing this problem. Replace the right margin switch.

If the problem is still not found, search on ImageWriter General Troubleshooting.

Disk III Analog PCB Troubleshooting

Revised: 1/30/92
Security: Everyone

Disk III Analog PCB Troubleshooting

=====

DESCRIPTION: Use this procedure only if a Disk III Analog PCB problem is confirmed. To obtain the procedure to confirm a Disk III problem, search on "HTS and Disk III and General".

YOU WILL NEED:

1. The following Disk III Analog PCB chips:
 - * IC 2003 (APN 327-2003)
 - * IC 74LS125 (APN 305-0125)
 - * IC CA3146 (APN 351-3146)
 - * IC 3470 (APN 355-3470)
 - * IC 74LS74 (APN 305-0074)
 - * IC 74LS32 (APN 305-0032)
2. Disk alignment aid
3. Level I Tech Procedures binders

BEFORE YOU START:

1. Refer to the Technical Procedures if removal/replacement or adjustment procedures are needed.
2. Before replacing a component on the Analog PCB, make sure that the power is off and remove the Analog PCB.
3. If replaced module/part doesn't fix the problem, reinstall the original module/part.

INSTRUCTIONS:

1. Remove the problem drive's case to expose the Analog PCB.
2. Examine the Analog PCB for:
 - * R32 at location D1 missing (send to Apple)
 - * IC 74LS74 at location E1 missing (replace)
 - * Jumper wires soldered to back (send to Apple)
 - * Damage (e.g., burns, cracks, etc.) if board is beyond repair, throw it away. Examine each chip and its socket.

- * If repair is possible but it can't be made by replacing a socketted chip send the Analog PCB to Apple.

3. Find the PROBLEM below and perform appropriate FIX.

PROB: Known good internal Disk III in test bed Apple III won't boot when the problem drive is installed externally

FIX: Recheck for the problem after each of the following steps

- (1) Replace IC 2003 at location C4
- (2) Replace IC 3470 at location B1 and IC 74LS125 at location G2 then if it boots, perform the comparator offset adjustment
- (3) Replace IC 3146 at location A3
- (4) Replace IC 74LS74 at location E2
- (5) Send the Analog PCB to Apple

PROB: Drive will not perform the D-Speed adjustment

FIX: Recheck for the problem after each of the following steps

- (1) Replace IC 3470 at location B1 and IC 74LS125 at location G2 then perform the comparator offset adjustment
- (2) Replace IC 3146 at location A3
- (3) Replace IC 2003 at location C4
- (4) Replace IC 74LS74 at location E2
- (5) Replace IC 74LS32 at location F1
- (6) Send the Disk III Analog PCB to Apple

PROB: Drive does not come on.

FIX: Recheck for the problem after each of the following steps

- (1) Replace IC 2003 at location C4
- (2) Replace IC 74LS125 at location G2
- (3) Send the Disk III Analog PCB to Apple

PROB: Drive with the problem Analog PCB installed reads but doesn't write

FIX: Recheck for the problem after each of the following steps

- (1) Replace IC 74LS125 at location G2
- (2) Replace IC 2003 at location C4
- (3) Replace IC 3146 at location A3
- (4) Send the Disk III Analog PCB to Apple

PROB: Drive writes when the disk is protected

FIX: Recheck for the problem after each of the following steps

- (1) Replace IC 74LS125 at location G2
- (2) Send the Analog PCB to Apple

PROB: None of the symptoms above match those of the problem

FIX: Recheck for the problem after each of the following steps

- (1) Perform the D-Speed adjustment
- (2) Replace IC 3470 at location B1 and IC 74LS125 at location G2 then perform the comparator offset adjustment
- (3) Replace all socketted chips one at time
 - * IC 2003 at location C4
 - * IC 3146 at location A3
 - * IC 74LS74 at location E2
 - * IC 74LS32 at location F1
- (4) Every chip on the PCB has been replaced. If it still doesn't

work, send the Analog PCB to Apple.

Duodisk General Troubleshooting

Revised: 1/30/92
Security: Everyone

Duodisk General Troubleshooting

=====

DESCRIPTION:

By following this procedure you can isolate a malfunction on the Duodisk and determine whether or not it is functional.

YOU WILL NEED:

1. "Known good" Apple IIe computer
2. Two DOS formatted 5 1/4 disks (one write protected the other not)
3. "Known good" Duodisk controller PCB - IN SLOT 6
4. 2 copies of DAP (Drive Acceptance Program) (APN 077-8101) - it is copyable
5. DDD (Digital Diagnostic Disk) (APN 689-8024)
6. Level I Tech Procedures

BEFORE YOU START:

1. If replacement or adjustment procedures are needed, refer to the Tech Procedures
2. If a replaced module/part doesn't fix a problem, reinstall the original module/part.
3. If the analog card proves to be problem, search on "HTS and Duodisk and Analog" for the analog card troubleshooting procedure.
4. After repair, check drive with "other" DAP disk (original may be damaged).

INSTRUCTIONS:

1. Connect the problem Duodisk to the controller in the Apple IIe.
2. Boot the DAP disk in LEFT drive.

a. First screen shows 2 drives and 2 arrow keys.

b. You run the program with the 2 arrow keys.

c. If drive booted OK, go to step 3; if not, check for problems below.

PROB: Won't boot. Drive comes on but I/O errors occur

FIX: Recheck for the problem after each of the following steps

(1) Try other DAP disk.

(2) Try reading a file from the other drive on the Duodisk. If it

fails, replace analog card.

- (3) Perform Dspeed adjustment in Tech Procedures (you'll need to use a known good drive in addition to the problem drive to make this adjustment). If the problem drive won't adjust, replace analog card
- (4) Examine the head. If dirty, clean it with solution of 80% denatured alcohol and 20 % distilled water (for more info search on Disk Drive Preventive Maintenance); if the head is scored replace the mechanical assembly containing the head.
- (5) Replace interface cable
- (6) Replace disk mechanical on the problem drive
- (7) Replace analog card

PROB: Won't boot. Drive doesn't come on.

FIX: Recheck for problem after each of the following steps

- (1) Boot from other drive on Duodisk. If it fails, replace analog card.
- (2) Replace interface cable
- (3) Replace disk mechanical
- (4) Replace analog card

PROB: Drive makes unacceptable noise

FIX: Replace disk mechanical

3. Press "LEFT" arrow to select "LEFT" drive for test.
4. Screen asks you to install WRITE-PROTECTED blank disk into drive. After you do, press the RIGHT arrow to continue running the test...drive whirs. Read IMPORTANT below.

IMPORTANT: If a failure occurs during the following steps, the drive under test will be crossed out and the number(s) above the crossed out drive will indicate which test(s) failed. If this happens, go to the end of this procedure find the Test #(s) that failed and perform the appropriate repair action.

5. The changing arrows on the screen tell you to remove the WRITE-PROTECTED disk and install NON-WRITE-PROTECTED blank disk into drive. After you do, press RIGHT arrow to continue running the test...drive whirs test numbers change as tests are performed.
6. After a minute or so and while drive is still whirring, screen asks you to install DDD disk. After you do, PRESS the RIGHT ARROW to continue tests...drive continues to whir, DDD disk change screen leaves, etc.
7. The drive stops whirring and the screen asks you to remove the DDD disk, this is the end of the test and indicates that the LEFT drive is OK so press the LEFT arrow once to go back to the first screen, then press RIGHT arrow to select RIGHT drive for test and go back to step 4.

If a failure occurred in the procedure above, find the Test #(s) that failed

and perform the appropriate repair action.

TEST# - REPAIR ACTION

- 1 Make sure test was done using proper disks (i.e., DOS 3.3 formatted,
 blank, write protected/non-write protected).
 Replace disk mechanical
 Replace analog card
 Send to Apple
- 2 Adjust D-Speed
 Replace analog card
 Replace disk mechanical
 Send to Apple
- 3 Replace analog card
 Replace disk mechanical
 Send to Apple
- 4 Rerun test (test 4 failure can indicate bad DDD disk)
 Replace disk mechanical
 Send to Apple
- 5 Replace disk mechanical
 Send to Apple
- 6 or 7 Replace disk mechanical
 Send to Apple

DMP General Troubleshooting

Revised: 11/7/88
Security: Everyone

DMP General Troubleshooting

=====

This article last reviewed: 1 November 1988

DESCRIPTION:

Follow this procedure to determine that the DMP is functional.

YOU WILL NEED:

1. Apple IIe computer
2. Apple IIe Parallel Interface Card
3. Printer cable
4. The Level I Tech Procedures
5. DMP User's Manual
6. Pencil and paper

BEFORE YOU START:

1. For replacement or adjustment procedures, refer to the Technical Procedures.
2. If a replaced module/part doesn't fix the problem, reinstall the original module/part.
3. For locations of DMP controls, refer to User's manual.

CHECK 1: PRE-PRINT

- 1.1 Disconnect the printer cable at the back of the DMP
- 1.2 Check that the top panel is installed correctly
- 1.3 Check that paper is installed
- 1.4 Turn the platen knob

PROB: The platen binds or doesn't turn consistently.

FIX: Remove the carrier cover and paper cover, use pen-light to examine the platen gears for obstructions.

- 1.5 Move the carriage to its rightmost position.

PROB: The carriage binds or doesn't move consistently

FIX: Check if carrier wire is strung properly or out of tension specification as described in Tech Procedures.

..TIL01396-DMP_General_Troubleshooting_(TA30572).pdf

PROB: The carriage does not return to the leftmost position.
FIX: Clean the end of travel sensor.

CHECK 2: POWER ON INITIALIZATION

As you turn on the printer, check for the conditions in 2.1, 2.2, 2.3, and 2.4.

If any do not occur as described, search on "HTS and DMP and Initialization". The document you will obtain contains fixes for DMP power-on problems.

- 2.1 The power lamp should come on.
- 2.2 The platen should rotate one line backward and then one line forward.
- 2.3 The carriage should move smoothly to its leftmost position and stop.
- 2.4 The SEL lamp should come on.

CHECK 3: SELF TEST

If conditions described in 3.1 and 3.2 do not occur as described, go back to the AppleLink Word Search Screen and enter "HTS and DMP and Self Test". The document obtained will contain FIXes for DMP Self Test problems.

- 3.1 Turn on the printer while pressing the TOF switch. The printer should begin printing CHARACTER SETS.
- 3.2 If print quality is good, go to CHECK 4.

CHECK 4: HOST PRINT

4.1 Turn off the printer, write down the customer's configuration of the DIP switches in the printer, then set the DIP switches as shown below:

(Note: Op = open, Cl = closed, Nu = not used)

SW1								SW2							
1	2	3	4	5	6	7	8	1	2	3	4	5	6	7	8
Op	Op	Op	Op	Op	Op	Op	Op	Op	Op	Nu	Nu	Op	Cl	Cl	Op

4.2 Install the Parallel Interface Card in slot 1. Connect the DMP to the card via printer cable. Turn on the DMP (make sure cover is installed). Turn on the IIe and press the RESET key while you press the CONTROL key (DO NOT BOOT A DISK). The cursor should blink.

Type the program exactly as shown below.

```
10 PR#1
20 FOR A = 1 TO 100
30 FOR I = 32 TO 126
30 PRINT CHR$(I);:NEXT I:PRINT
40 NEXT A
```

```
50 PR#0
60 END
```

4.3 Type RUN and press the <RETURN> key. The printer should print out about 100 character sets like the one shown below. If it does, the DMP communicates with the computer OK.

```
!#$%&'()*+,-./0123456789:;<>?@ABCDEFGHIJKLMNPOQRSTUVWXYZ[\]^_`abcdefghijklmnopqrstuvwxyz{|}
```

If it doesn't, look below for problems.

* If you get a SYNTAX ERROR on the computer, you may have mis-typed the line.

To correct the syntax error perform the following:

- (1) Type LIST and press <RETURN>. The program should appear on the screen.
- (2) Examine the program for accuracy. Spaces, colons, etc. are important.
- (3) To correct a line, simply retype the line and press <RETURN>. LIST again to make sure the correction is OK.

* If nothing happens on the printer or the computer, press the RESET key while you press the CONTROL key. Then LIST your program as described above in the SYNTAX ERROR explanation to look for typing errors.

* If no syntax errors occurred and the cursor is blinking again; then the program has probably run OK. If the printout is not satisfactory, search on "HTS and DMP and COMMUNICATIONS". The document you will obtain contains fixes for DMP hardware communications problems.

4.4 If the printer has performed correctly, perform the following:

- (1) Return the DMP DIP switches to the customer's configuration, then refer to the DMP User's manual to check that the customer's DIP switch configuration is right for his requirements.
- (2) Perform the Periodic Maintenance procedure in Technical Procedures/DMP tab/section 1.

DMP Power On Initialization Problems

Revised: 11/7/88
Security: Everyone

DMP Power On Initialization Problems

=====

This article last reviewed: 1 November 1988

DESCRIPTION:

When the printer is turned on it should automatically perform a series of electro-mechanical operations to initialize itself before printing.

The following table is composed of FIXES for typical PROBLEMS which may occur during power-on initialization.

YOU WILL NEED:

1. Level I Technical Procedures
2. Pen-light

BEFORE YOU START:

1. Refer to the Technical Procedures if removal/replacement or adjustment procedures are needed.
2. If a replacement module/part doesn't fix the problem, reinstall the original module/part.

INSTRUCTIONS:

1. When you turn on the DMP, it should initialize itself as follows:
 - (1.1) light the Power lamp.
 - (1.2) rotate the platen one line backwards and then one line forwards.
 - (1.3) move the carriage to its leftmost position and stop.
 - (1.4) light the Select lamp.

2. Find your PROBLEM below and perform the corresponding FIX.

- - - - -

PROB: The power lamp does not light when the DMP is turned on.

FIX: Recheck for the problem after each of the following steps:

- (1) Check that power is turned on.
- (2) Check that the power cord is plugged in.
- (3) Check the power fuse at the back of the printer.
If it is burned out, replace it and turn power on again. If the fuse blows a second time, replace

components in this order:

- * Regulator Transistor
- * CPU PC board
- * Carrier Motor
- * Transformer

(4) Check the two fuses on the CPU board and replace if blown.

(5) Replace the following components. Recheck for the problem after each replacement.

- * Power cord
- * Power switch
- * CPU PC board
- * Carrier Motor
- * Transformer

PROB: The platen does not rotate one line backward and then one line forward when the printer is turned on.

FIX: Recheck for the problem after each of the following steps:

- (1) Remove the carrier cover and the paper cover. Use the pen-light to examine the gears for obstructions.
- (2) Check for loose connectors as you follow the procedure to replace the main logic PCB found in the Tech Procedures.
 - * If you find a loose connector, don't replace the main logic PCB but instead install the connector securely.
 - * If you don't find a loose connector, replace the main logic PCB.
- (3) Replace the mechanical assembly

PROB: The DMP does not move the carriage smoothly from its rightmost to its leftmost position and stop as the printer is turned on.

FIX: Recheck for the problem after each of the following steps:

- (1) Check if carrier wire is strung properly.
- (2) Check for loose connectors as you follow the procedure to replace the main logic PCB found the Technical Procedures
 - * If you find a loose connector, don't replace the main logic PCB but instead install the connector securely.
 - * If you don't find a loose connector, replace the main logic PCB.
- (3) Replace the Carrier motor.

PROB: There is a burning odor, erratic carrier motion, or erratic platen rotation when the printer is turned on.

FIX: Check for the problem after replacing each of the following parts. If the problem remains, leave the part installed and replace the next part:

- (1) CPU PC board
- (2) Carrier motor
- (3) Mechanical assembly
- (4) Transformer
- (5) When the problem no longer occurs, reinstall the parts that you've replaced and recheck for the problem. If another problem occurs, reperform this procedure.

Tech Info Library

DMP Self Test Problems

Revised: 11/7/88
Security: Everyone

DMP Self Test Problems

=====

This article last reviewed: 1 November 1988

DESCRIPTION:

This table is composed of fixes for typical DMP Self Test problems.

YOU WILL NEED:

The Apple Service Level I Technical Procedures

BEFORE YOU START:

1. Refer to the Technical Procedures if removal/replacement or adjustment procedures are needed.
2. If a replacement module/part doesn't fix the problem, reinstall the original module/part.

INSTRUCTION:

1. Press the Form Feed switch while you turn on the DMP, the printer should print a line of characters (one character set).
2. Find your PROBLEM below and perform the corresponding FIX.

- - - - -

PROB: There is a burning odor, erratic carrier motion, or erratic platen rotation.

FIX: Recheck for the problem after replacing each of the following parts:

- (1) CPU PC board
- (2) Carrier motor
- (3) Mechanical assembly
- (4) Transformer

PROB: The printer doesn't print a character set when Self Test is initiated.

FIX: Perform the following steps. Retry the Self Test if a problem is found.

- (1) Check that the top cover is seated properly. If it isn't, close it. Then press SEL and retry self-test.
- (2) Check if PE lamp is lit on switch panel. If it is, reload paper
- (3) Check the connectors between the carrier and carrier motor and the

CPU PC board. If any of the connectors are loose, connect them.

- (4) Replace the CPU PC board.
- (5) Replace the Carrier motor.

PROB: The printer prints a character set when Self Test is initiated but the print quality is poor.

FIX: Find your print quality problem in the tables below.

* DOTS MISSING

- (1) Make sure dot head is in place.
- (2) Make sure dot head is not clogged with dirt.
- (3) Make sure dot head connector is plugged properly in CPU board.
- (4) Check impression control lever properly set. Push it away from you to its forwardmost position if using single sheet of paper.
- (5) Replace the Dot head.
- (6) Replace the CPU PC board.

* PRINT TOO LIGHT OR VARYING INTENSITY

- (1) Check impression control lever properly set. Push it away from you to its forwardmost position if using single sheet of paper
- (2) Substitute new ribbon cartridge.
- (3) Check if ribbon wire tension is loose and adjust as necessary.
- (4) Adjust intensity pot located under the clear plastic sheet that covers the configuration switches. Locate VR2 IMPRES and adjust for optimum print density.
- (5) Replace the Ribbon cassette.
- (6) Replace the Dot head.
- (7) Replace the CPU PC board.

* HORIZONTAL SPACING PROBLEM

- (1) Check if carrier wire is strung properly or out of tension specification.
- (2) Replace the Carrier wire.
- (3) Replace the Carrier motor.
- (4) Replace the CPU PC board.

* CHARACTERS DO NOT ALIGN VERTICALLY BETWEEN LINES

Locate VR1 ALIGN under the clear plastic sheet that covers the configuration switches. Adjust for optimum vertical alignment.

DMP Hardware Communication Problems

Revised: 11/7/88
Security: Everyone

DMP Hardware Communication Problems

=====

This article last reviewed: 1 November 1988

DESCRIPTION:

This table is composed of typical DMP communication problem symptoms and their fixes. If your problem matches up with one of the symptoms perform the appropriate fix.

YOU WILL NEED:

1. Apple IIe computer
2. Apple IIe Parallel Interface Card
3. Printer cable
4. Level I Tech Procedures
5. DMP Operators Guide

INSTRUCTION:

- * Refer to the Technical Procedures if removal/replacement or adjustment procedures are needed.
 - * If a replacement module/part doesn't fix the problem, reinstall the original module/part.
 - * In order to isolate a hardware communications problem, you first need to eliminate the possibility of a software or DIP switch configuration problem. To do this perform the following.
1. Turn off the printer, write down the customer's configuration of the DIP switches in the printer then set the DIP switches as shown below: (Note: Op = open, Cl = closed, Nu = not used)

SW1								SW1							
1	2	3	4	5	6	7	8	1	2	3	4	5	6	7	8
Op	Op	Op	Op	Op	Op	Op	Op	Op	Op	Nu	Nu	Op	Cl	Cl	Op

2. Install the Parallel Interface Card in slot 1. Connect the DMP to the card via printer cable. Turn on the DMP (make sure cover is installed).

..TIL01399-DMP_Hardware_Communication_Problems_(TA30596).pdf

Turn on the IIE and press the RESET key while you press the CONTROL key (DO NOT BOOT A DISK). The cursor should blink.

Type the program exactly as shown below.

```
10 PR#1
20 FOR A = 1 TO 100
30 FOR I = 32 TO 126
30 PRINT CHR$(I);:NEXT I:PRINT
40 NEXT A
50 PR#0
60 END
```

3. After you type RUN and press the <RETURN> key. The printer should print out about 100 character sets like the one shown below. If it does, the DMP communicates with the computer OK.

```
!#$%&'()*+,-./0123456789:;<>?@ABCDEFGHIJKLMN OPQRSTUVWXYZ[\]^_`abcdefghijklmno
pqrstuvwxyz{|}
```

If it doesn't, look below for problems.

- * If you get a SYNTAX ERROR on the computer, you may have mis-typed a line. To correct the syntax error perform the following:
 - (1) Type LIST and press <RETURN>. The program should appear on the screen.
 - (2) Examine the program for accuracy. Spaces, colons, etc. are important.
 - (3) To correct a line, simply retype the line and press <RETURN>. LIST again to make sure the correction is OK.
- * If nothing happens on the printer or the computer, press the RESET key while you press the CONTROL key. Then LIST your program as described above in the SYNTAX ERROR explanation to look for typing errors.
- * If no syntax errors occurred; the cursor is blinking again; then the program has probably run OK. If the printout is not satisfactory, look below for your problem.

SYMPTOM: The printer does not print a set of characters.

FIX: Recheck for the problem after each of the following steps. If no problem is found, go to step 3.

- (1) Check that the computer is properly powered on and initialized.
- (2) Check if SEL light is on. If it's off, press SEL and try printing under computer control with the program in step 2. If it prints while light is off, replace the switch panel.
- (3) Make sure that the interface cable between the printer and the computer is connected and secured at both ends.
- (4) Check DMP user's manual for correct setting of configuration switches.
- (5) Replace main logic PCB.

..TIL01399-DMP_Hardware_Communication_Problems_(TA30596).pdf

SYMPTOM: The printer prints a set of characters but print quality is poor.

FIX: Do a word search for "DMP and HTS and Self Test Problems" to obtain the print quality fix.

4. Reset the DIP switches to the customer's original configuration. Then check to see if the customer's DIP switch configuration or software configuration for the application he was using caused the problem.

Monitor II Prob/Cure:Vert or Horiz Line or Dot in Display Center

Revised: 11/7/88
Security: Everyone

Monitor II Prob/Cure:Vert or Horiz Line or Dot in Display Center

=====

This article last reviewed: 02 November 1988

PROBLEM DESCRIPTION: After the Monitor II has had a chance to warm up, there is a vertical line or a horizontal line or dot going through the center of the display.

WARNING: Turn off and unplug the monitor whenever the case is removed.

CAUSE: 1. The yoke assembly may be bad or misconnected.
2. The electronics module may be bad.

CURE: 1. Check that the gray/brown wires going from the yoke to the electronics module are properly connected.
2. If these wires are properly connected, replace the yoke. Then install the case and turn on the Monitor and check for the faulty display.
3. If the display is still faulty, replace the electronics assembly.

If the above cure doesn't solve your problem, refer to the Tech Procedures to obtain the general troubleshooting procedure for this product.

Asynchronous DataComm (Stop Bits and Framing Errors)

Revised: 11/7/88
Security: Everyone

Asynchronous DataComm (Stop Bits and Framing Errors)

=====

This article last reviewed: 2 November 1988

BACKGROUND

In RS232 there are two data pins, one for transmit and one for receive. One of two possible voltages on a data wire will express the state of the bit being transferred. In RS-232 the logic zero is assigned the positive voltage and the logic one is assigned the negative voltage.

When no data is being transferred on the data wire it is considered to be in an idle condition. In the idle condition the data wire has the same voltage that is used to express a one.

Inside both the transmitting and receiving units are electronic devices called clock circuits, which produce signals called "clock pulses" or clocks. The frequency of the clock signal is dependent on the BPS or Baud rate being used for the transmission. In synchronous data transfers, clock signals accompany the data being transferred.

In asynchronous data transfers, clock signals are used only on the "inside" of the sending and receiving units. This article discusses asynchronous data transmission only.

To make it easy for the receiving unit to know how many bits are coming, every asynchronous data transfer contains a set number of bits. Each transfer contains one byte of data plus a start bit and one or more stop bits.

START BIT

In an asynchronous data transfer, the receiving unit needs a change in voltage on the data wire to notify it that data is coming. The sending unit does this by preceding every character transmitted with a start bit (a logic zero; positive voltage in RS-232). After the sending unit does this it uses eight clock pulses to clock eight bits on to the data wire.

Once the receiving unit senses the start bit, it knows that data will follow. So, it clocks the data in from the data wire.

STOP BIT

In asynchronous data transfers the receiving unit will always wait a period of time after the eighth bit is clocked in before it will again allow itself to detect a start bit on the data wire. This period is divided into bit times, the same length as those used for the transmitted data bits. Since they signify the end of the character transmission, these bit times are called stop bits.

The number of stop bits (usually one or two) can often be selected when configuring application software, interface boards, and DIP switches. If all three places give the option for selecting stop bits, they should all be set to the same value. During the stop bit, the sending unit should maintain the data wire at the negative (idle) voltage level. At this time, the receiving unit will sample the data wire.

If both the sending unit and receiving unit are at the same BPS (BAUD) rate, then after it has finished clocking in the data from the sending unit, the receiving unit should see the stop bit's negative (idle) voltage level.

If the receiving unit sees a positive voltage at this time, then it knows that it and the sending unit are out of synchronous so it generates a framing error.

NOTE: A framing error commonly occurs when the sending and receiving units are at different BPS or BAUD rates.

CHARACTER MODE ASYNCHRONOUS

Character mode asynchronous data transfers occur one byte (character) at a time, with each transfer separated by idle time. Character mode is used for interactive communications, as when a personal computer user in terminal mode communicates with a bulletin board.

BLOCK MODE ASYNCHRONOUS

Block mode asynchronous data transfers have no idle time between character transmissions. The sending unit packs the asynchronous data transfers end to end with no idle time (except for the stop bit). A block mode asynchronous data transfer is used for things like file transfers, where a large mass of already existing data is sent.

Disk Drive Preventive Maintenance

Revised: 11/7/88
Security: Everyone

Disk Drive Preventive Maintenance

=====

This article last reviewed: 2 November 1988

PROTECT YOUR MEDIA

Sometimes "disk drive problems" are really media problems, caused by the way the customer stores his disks. Make sure your customers know to keep disks away from dust, heat, electromagnetic inducing devices such as power supplies, CRTs, magnets, and the power/sweep PCB on the left side of a Macintosh.

YOU WILL NEED

1. Q-tips
2. Solution of 80% denatured alcohol and 20% deionized or distilled water

INSTRUCTIONS

The following preventive maintenance procedures should be performed whenever a repair or adjustment is done on a disk drive.

DISK II AND DISK III

1. Remove the cover and clean the guide rails (the metal shafts that the head slides on) with the alcohol/water solution. Do not use grease.
2. Inspect the head for worn or dull spots in the ceramic. If you find any, replace the assembly containing the head.
3. Clean the head with the alcohol/water solution.
4. Remove the bottom of the drive and inspect the disk drive belt for cracks, slippage, and elasticity (should not be dry and cracked). Replace if necessary.
5. Move the head assembly back and forth along its full length of travel. Check for blockage and smooth easy movement.

DUODISK AND UNIDISK

1. Remove the cover, the shield(s) and the analog PCB. Then perform steps 1 through 5 as explained in DISK II AND DISK III above.
2. Locate the spring connected to the head drive band. Make sure that it is holding the band reasonably taut.

APPLE IIc DISK DRIVE

1. Remove the disk drive from the Apple IIc and remove the mechanical assembly from the disk drive. Then perform steps 1 through 5 as explained in "DISK II AND DISK III", above.
2. Locate the spring connected to the head drive band. Make sure that it is holding the band reasonably taut.

MAC EXTERNAL DRIVE

No preventive maintenance is required on this drive. However, it is recommended that it be used only on the right hand side of the Macintosh. This helps keep any electro-magnetic interference from the power/sweep PCB from affecting disk drive operation.

ImageWriter II Initial Checks

Revised: 11/7/88
Security: Everyone

ImageWriter II Initial Checks

=====

This article last reviewed: 2 November 1988

NOTE: Remove the Option Card if one is installed. Check the DIP switches after removal. SW2-4 should be open/off with the card out.

This initial check table deals with minor problems such as a loose cable, bad ribbon cartridge (color or black), incorrectly set DIP switches, etc. The items on this list should always be checked before you begin actual troubleshooting.

INITIAL CHECKS

Check for the problems below. If your problem isn't listed in or solved by the initial checks, search on IMAGEWRITER II GENERAL TROUBLESHOOTING.

SYMPTOM	CHECK
Error lamp blinks	-Is carrier cover securely in place? -If left margin error occurs while printing, it may be a software problem: try other software.
Select off, Error on	-No paper or paper improperly inserted?
No printing or garbled printing	-Is the interface cable between the printer and computer loose or disconnected? -Check DIP switches: SW2-1 and SW2-2 should be closed for 9600 BPS SW2-3 should be open for DTR handshaking (DTR is a popular form of data flow control; for more info on flow control search on HTS and FLOW CONTROL). SW2-4 should be open if no option card is installed and closed if an option card is installed.

Software-specific problem	<ul style="list-style-type: none">-Try a known good piece of software.-Contact the Software Manufacturer to see if the program supports the IW II.
Prints okay for a while then garbage	<ul style="list-style-type: none">-Set DIP switch 2-3 to the correct serial protocol.-Check that cable is securely installed.
Overprinting	<ul style="list-style-type: none">-Check that the program being used is set for the correct line spacing and line length.
Light printing	<ul style="list-style-type: none">-Change ribbon cartridge.-Try different settings of the impression control lever (four positions).

ImageWriter II General Troubleshooting

Revised: 7/22/88
Security: Everyone

ImageWriter II General Troubleshooting

=====

This article last reviewed: 20 February 1989

DESCRIPTION:

Follow this procedure to determine whether the ImageWriter II is functional.

YOU WILL NEED:

1. Apple IIe computer
2. Super Serial Card
3. Printer cable
4. Level I Tech Procedures for ImageWriter II
5. ImageWriter II User's Manual
6. Pencil and paper
7. Color ribbon for the ImageWriter II

A NOTE ABOUT THE RED ERROR LIGHT:

If the ERROR LIGHT stays lit: Check and make sure that the printer is not out of paper. The paper-out switch or main CPU PCB might be defective if the printer has paper inserted properly.

The ERROR LIGHT blinks at regular intervals: Check to make sure that the cover is securely fastened and that the magnet is still in place (located under the front right of the cover). Sometimes the magnet becomes loosened and falls out. Also, check to make sure that a paper jam has not occurred.

The ERROR light blinks irregularly: Check DIP switch 4 on Switch 2. DIP switch 4 should be set to the "closed" position if the AppleTalk Card or Memory Card is installed. Otherwise DIP switch 4 should be set to "open".

BEFORE YOU START:

1. If replacement or adjustment procedures are needed, refer to the Tech Procedures.

2. If location for IW II controls is needed, refer to the User's Manual.
3. Install the color ribbon on the printer.

CHECK 1: PRE-PRINT

- 1.1 Disconnect the printer cable at the back of the IW II.
- 1.2 Remove the AppleTalk Option card
- 1.3 Check that the top panel is installed correctly.
- 1.4 Check that paper is installed.
- 1.5 Turn the platen knob.

PROB: The platen binds or doesn't turn consistently.

FIX: Take off the top cover, pull off the platen knob and check for obstructions in the gears

- 1.6 Move the carriage back and forth along its full length of travel.

PROB: The carriage binds or doesn't move consistently.

FIX: Check if carrier belt is properly installed.
Check for obstructions. "Very" lightly lubricate the carrier shaft with tellus lubrication oil.

CHECK 2: POWER ON INITIALIZATION

As you turn on the printer, check for NORMAL PRINTER ACTIONS below.

NORMAL PRINTER ACTION

IF NOT THEN

The power lamp lights.

Search on HTS and ImageWriter II and Power/Carrier problems

The carrier should move slowly to its leftmost position then rapidly to its center position

Search on HTS and ImageWriter II and Power/Carrier Problems

The platen should rotate one line backward and one forward

Search on HTS and ImageWriter II and Line Feed Problems

The ribbon frame assembly should tilt down about two lines and then up to become level again.

Search on HTS and ImageWriter II and Color Select Problems

The SEL lamp lights.

Search on HTS and ImageWriter II and Communication Problems

CHECK 3: SELF TEST

To initiate Self Test: turn the printer off and press Form Feed while you turn it back on. The printer should print:

SELF TEST

ROMREV

DIP switch settings

RAM XX AT On or OFF

and then begin printing lines of CHARACTER SETS in alternating colors.

If the Self Test occurs as described above and the print quality is good, go to CHECK 4.

If the printer doesn't print character sets or the print quality is poor, search on "HTS and Imagewriter II and Self Test". The document you will obtain contains fixes for IW II Self Test problems.

CHECK 4: HOST PRINT

4.1 Turn off the printer, write down the customer's Super Serial Card and printer DIP switch configurations. Set the DIP switches as shown below:

(Note: Op = open, Cl = closed, up = On, dn = Off)

IW II-SW1								IW II-SW2					
Op	Op	Op	Op	Op	Cl	Op	Op	Op	Op	Cl	Cl	N/A	N/A
1	2	3	4	5	6	7	8	1	2	3	4	5	6

SSC-SW1							SSC-SW2						
Off	Off	Off	On	Off	On	On	On	Off	Off	On	On	Off	Off
1	2	3	4	5	6	7	1	2	3	4	5	6	7

MODEM/TERM jumper
block to TERM

NOTE: Dip switches 2-5 and 2-6 on the printer are preset at the factory. They control the timing of the firing of the hammer. Do not move these switches unless a hammer firing adjustment is being done. Refer to ImageWriter II Technical Procedures for more information.

4.2 Remove all peripheral cards from the IIe. Install the Super Serial card in slot 1. Connect the IW II to the S/S card via printer cable. Turn on the IW II (make sure cover is installed). Turn on the IIe and press the RESET key while you press the CONTROL key (DO NOT BOOT A DISK). The cursor should blink.

Type the program exactly as shown below.

```
10 PR#1
20 FOR A = 1 TO 100
30 FOR I = 32 TO 126
40 PRINT CHR$(I);:NEXT I:PRINT
50 NEXT A
60 PR#0
70 END
```

4.3 After you type RUN and press the <RETURN> key. The printer should

print out about 100 character sets like the one shown below. If it does, the IW II is OK.

```
!#$%&'()*+,-./0123456789:;<>?@ABCDEFGHIJKLMNPOQRSTUVWXYZ[\]^_`abcdefghijklmnopqrstuvwxyz{|}
```

If it doesn't, look below for problems.

* If you get a SYNTAX ERROR on the computer, you may have mis-typed a line.

To correct the syntax error perform the following:

- (1) Type LIST and press <RETURN>. The program should appear on the screen.
- (2) Examine the program for accuracy. Spaces, colons, etc. are important.
- (3) To correct a line, simply retype the line and press <RETURN>. LIST again to make sure the correction is OK.

* If nothing happens on the printer or the computer, press the RESET key while you press the CONTROL key. Then LIST your program as described above in the SYNTAX ERROR explanation to look for typing errors.

* If no syntax errors occurred; the cursor is blinking again; then the program has probably run OK so there must be a problem with the printer. Search on "HTS and Imagewriter II and Communications". The document you will obtain contains fixes for IW II hardware communications problems.

ImageWriter II:Carriage Problems and Cures

Revised: 1/30/92
Security: Everyone

ImageWriter II:Carriage Problems and Cures

=====

This article last reviewed: 23 November 1987

#1: Carriage Hums and Won't Move at Power On

PROBLEM DESCRIPTION: When the printer is powered on, the carriage should move to the far left and then back to the center of its travel. With this problem, the carriage doesn't move at all at power on.

CAUSE: Printer is shipped with plastic tubes on the carriage shaft to hold the carriage stationary and so prevent damage. It is not easy to see that these tubes are just shipping fixtures so sometimes they aren't removed at installation.

CURE: If plastic tube shipping fixtures are installed, remove them from the carriage shaft.

#2:Carriage Moves to the Right at Power Up

PROBLEM DESCRIPTION: Carriage moves to the right instead of the left at power up.

CAUSE: The CPU PCB may be defective.

CURE: Replace the CPU PCB with a known good one.

#3:DEAD PRINTER

PROBLEM DESCRIPTION: When you power up the printer the carriage doesn't move at all.

CAUSE: it could be a defective Driver PCB; it could be a

defective CPU PCB.

CURE: 1. If the LEDs are not lighting, replace the Driver PCB.
2. If the LEDs are lighting, replace the CPU PCB.

#4: AFTER POWER UP CARRIAGE MOVES LEFT BUT DOESN'T CENTER

PROBLEM DESCRIPTION: When the printer is turned on, the Carriage moves to the left but does not return to the center.

CAUSE: The end of travel switch mounted under the Carriage Assembly may be bent or malfunctioning.

CURE: Power off the unit. Remove the top cover and slide the Carriage Assembly to the right. Set the printer on its right side and locate the switch under the Carriage Assembly. Make sure that it is not bent. If it isn't, push the switch and check for (a) or (b) below:

(a) IF THE SWITCH HESITATES TO GO IN AND RETURNS VERY SLOWLY, then it's probably stuck. Spray contact cleaner on the switch while you press it a few times. Do this until it operates freely.
Recheck for the problem.

(b) IF THE SWITCH OPERATES FREELY BUT THE CARRIAGE STILL WON'T CENTER AT POWER UP, the problem could be the CPU, switch, Carriage Assembly, ribbon cable, or power supply. Refer to the Tech Procedures for the troubleshooting procedure to isolate the problem to one of these modules.

#5:DESCRIPTION

When the printer is turned on, the power light should come on.

YOU WILL NEED:

1. Level I Tech Procedures for ImageWriter II
2. ImageWriter II User's Manual

BEFORE YOU START:

1. If a replacement doesn't fix the problem, reinstall the original module/part before continuing with the procedure.
2. For location of IW II module/parts, refer to the Level I Tech Procedures.

INSTRUCTIONS

1. Move the carriage back and forth along its full length of travel.

PROB: The carriage binds or doesn't move consistently.

FIX: Check if carrier belt is installed properly

Check for obstructions in the gears

2. Turn on the IW II. The power lamp should come on and the carriage should move slowly to its leftmost position, then rapidly to its center position.

PROB: The power lamp doesn't light when the IW II is turned on or the carriage does not operate properly.

FIX: Recheck for the problem after each of the following steps:

- (1) Check that power is turned on.
- (2) Check that the power cord is plugged in.
- (3) Replace the operation panel.
- (4) Check the 5 amp and 1 amp fuses on the Drive PCB
 - * If either is burned out, replace it and turn power on again.
 - * If the fuse blows a second time, replace components in this order
(recheck for the problem after each replacement):
 - a. Drive PCB
 - b. Carrier motor
 - c. Transformer
- (5) If the fuse is OK, swap the power cord.
- (6) Replace components in this order (recheck for the problem after each replacement): transformer, drive PCB, filter board, 2 amp fuse on the filter board, power switch.

PROB: There is a burning odor, erratic carrier motion, or erratic platen rotation when the printer is turned on.

FIX: Recheck for the problem after replacing each of the following parts:

- (1) Drive PCB
- (2) Main CPU PCB
- (3) Carrier motor
- (4) Flexible cable
- (5) PCB interconnection cable
- (6) Interface cable

If the above cures don't fix the problem, search on GTS and the product's name to obtain a general troubleshooting procedure.

ImageWriter II Line Feed Problems

Revised: 1/30/92
Security: Everyone

ImageWriter II Line Feed Problems

=====

This article last reviewed: 04 February 1988

YOU WILL NEED:

1. Level I Tech Procedures for ImageWriter II
2. ImageWriter II User's Manual
3. Digital Multi-meter

BEFORE YOU START:

1. If a replacement module/part doesn't fix the problem, reinstall the original module/part before continuing with the procedure.
2. For location of IW II parts, refer to the Level I Tech Procedures.
3. After each of the steps in this procedure, perform the IW II Self Test to see if the problem has been repaired. To initiate Self Test turn the printer off and press Form Feed while you turn it back on.

INSTRUCTIONS

1. To check the paper feed mechanism, insert paper, take off the top cover, pull off the platen knob, check for obstructions in the gears, and look to make sure the gears to the left of the platen mesh properly. If defective module/parts are found, replace them.

2. Turn off the printer and check the Form Feed and Line Feed switches on the operation panel as follows. If either proves defective, replace the operation panel.

2.1 Set the digital multi-meter to measure 200 ohms resistance.

2.2 Place the probes on pin 12 and pin 13 of the operation panel connector. The reading should show no connection (1).

2.3 Depress the Form Feed switch. The reading should show continuity (0.00).

2.4 Place the probes on pin 11 and pin 13 of the operation panel connector. The reading should show no connection (1).

2.5 Depress the Line Feed switch. The reading should show continuity (0.00).

3. Replace the Drive PCB

4. Turn off the printer and check the paper feed motor as follows. If it proves defective, replace it.

4.1 Set the digital multi-meter to measure 200 ohms resistance.

4.2 At the cable connector end (disconnected from the drive PCB), check the resistance values between pins 6 and 4, 6 and 2, 5 and 1, and 5 and 3 (pin 1 is the black wire). The value for each reading should be approximately 22 ohms.

4.3 Check the resistance values between pins 3 and 1; and 2 and 4. The value for each reading should be approximately 44 ohms.

5. Replace the Main CPU PCB.

PROBLEM/CURE:IMAGEWRITER II

--Line Feed Problems Cause Power Supply to Smoke--

PROBLEM DESCRIPTION: The line feed function is not working properly (too much friction) and/or a component on the power supply module may have burned up.

CAUSE: The line feed motor may have shorted a winding. This can cause components on the power supply and the CPU PCBs to be destroyed.

CURE: Remove the motor from the printer and try to turn its pulley. Check for (a) and (b) below:

(a) "If the pulley turns hard", then the windings are burned out so replace the bad line feed motor and recheck for the problem.

-If the printer still does not work after the replacement of the Line Feed motor, the original bad motor may have damaged the Power Supply and CPU PCBs. In this case try replacing one or the other or both of these modules.

(b) "If the pulley turns freely", then most likely the motor is good. Inspect the Power Supply for burned components, etc.

-If burned or discolored components are found on the Power Supply, replace the Power Supply.

-If the Power Supply appears to be OK, replace the CPU PCB.

If the above cures don't fix the problem, search on GTS and the product's name to obtain a general troubleshooting procedure.

ImageWriter II Color Select Problems

Revised: 11/7/88
Security: Everyone

ImageWriter II Color Select Problems

=====

This article last reviewed: 2 November 1988

YOU WILL NEED:

1. Level I Tech Procedures for ImageWriter II
2. ImageWriter II User's Manual
3. Digital Multi-meter
4. Color ribbon for the ImageWriter II

BEFORE YOU START:

1. If a replacement module/part doesn't fix the problem, reinstall the original module/part before continuing with the procedure.
2. For location of IW II module/parts, refer to the Level I Tech Procedures.
3. The other functions on the printer must be working before this procedure can be performed. To check out the other functions, try printing a file from the IIf.

INSTRUCTIONS

1. Press the FORM FEED switch on the IW II as you turn on the printer. The printer should print:

SELF TEST

ROMREV

DIP switch settings

RAM XX AT On or OFF

and then begin printing lines of CHARACTER SETS in alternating colors.

If the printout shows color select problems, continue with this procedure below.

2. Examine the color ribbon assembly (printer should be off). Verify that

the black tabs on the ribbon plate are riding on the spiral ridge of the ribbon cam. Check the ribbon cam for looseness. Also check the copper tab mounted behind and below the ribbon cam. When the cam is all the way up, the vertical ridge on the cam should hit the tab. If the color ribbon assembly is loose, the ribbon cam position is misaligned. For color printing adjustment procedures turn to Section 4, Adjustments, in the Tech Procedures. For more location info, see the illustrated parts diagrams in the Tech Procedures.

3. Replace the Drive PCB.
4. Turn off the printer and check the flexible cable and the ribbon motor as follows. If the check shows a problem, replace the flexible cable first and retry the check. If the problem remains, replace the ribbon motor.

NOTE: If part location information is needed, refer to the illustrated parts list in the Tech Procedures.

4.1 Detach the flexible cable from the drive PCB.

4.2 Set the digital multimeter to measure 200 ohms resistance.

4.3 On the flexible cable, check the resistance values between pins 3 and 7, 5 and 7, 4 and 8, and 6 and 8. The value for each reading should be approximately 120 ohms.

4.4 Check the resistance values between pins 3 and 5, and 4 and 6. The value for each reading should be approximately 240 ohms.

5. Replace the Main CPU PCB
6. Reset the DIP switches to the customer's original configuration. Then refer to the User's Manual and the Appendix in the Imagewriter II section of the Tech Procedures to see if the customer's DIP switch configuration caused the problem.

ImageWriter II Self Test Problems

Revised: 11/7/88
Security: Everyone

ImageWriter II Self Test Problems

=====

This article last reviewed: 2 November 1988

YOU WILL NEED:

1. Level I Tech Procedures for ImageWriter II
2. ImageWriter II User's Manual
3. ImageWriter II color ribbon
4. Digital multimeter

BEFORE YOU START:

1. Install the color ribbon on the IW II.
2. If replacement or adjustment procedures are needed, refer to the Tech Procedures.
3. For location of IW II controls, refer to the User's Manual.
4. The printer must be able to perform a normal "power on initialization" before it can perform a Self Test. If you are unsure that your printer can do this, search on HTS and IMAGEWRITER II and GENERAL. Perform the HTS ImageWriter II General troubleshooting procedure. If the printer fails Self Test in that procedure, return here for instructions.

INSTRUCTIONS:

To initiate Self Test: turn the printer off, and press Form Feed while you turn it back on. The printer should print:

SELF TEST

ROMREV

DIP switch settings

RAM XX AT (On or OFF)

..TIL01408-ImageWriter_II_Self_Test_Problems_(TA30678).pdf

and then begin printing CHARACTER SETS something like the one below in alternating colors.

```
!#$%&'()*+,-./0123456789:;<>?@ABCDEFGHIJKLMNPOQRSTUVWXYZ[\]^_`abcdefghijklmnopqrstuvwxyz{|}
```

- * If the Self Test occurs as described above and the print quality is good, the printer is OK.
- * If the print quality is poor, search on HTS and IMAGEWRITER II and PRINT QUALITY.
- * If the printout shows a color select problem, search on HTS and IMAGEWRITER II and COLOR SELECT.
- * If the printout shows a problem other than color select or print quality, perform the steps below:
 1. Turn the printer off and check the Form Feed switch on the operation panel as follows. If it proves defective, replace the operation panel.
 - 1.1 Set the digital multimeter to measure 200 ohms resistance.
 - 1.2 Place the probes on pin 12 and pin 13 of the operation panel connector. The reading should show no connection (1).
 - 1.3 Depress the Form Feed switch. The reading should show continuity (0.00).
 2. Turn the printer off and check the flexible cable and the Head PCB as follows. If check shows a problem, replace the flexible cable and Head PCB.
 - 2.1 Detach the flexible cable from the drive board.
 - 2.2 Locate the home position switch (under the left hand side of the ribbon carrier on the Head PCB).
 - 2.3 Set the digital multimeter to measure 200 ohms resistance.
 - 2.4 Place the probes on pin 10 and pin 12 on the flexible cable.
 - 2.5 Push the home position switch on the Head PCB. The reading should be 0.00 when the switch is depressed. When the switch is released, the reading should be 1.
 3. Replace the Drive PCB
 4. Manually move the carrier back and forth. If it will not move, visually

inspect the following. If you find a defective module/part, replace it.

4.1 Check the ribbon cartridge to be sure the ribbon is wound when the knob is turned in the direction of the arrow.

4.2 Check the carrier shaft and carrier belt for damage and foreign materials.

4.3 Check the ribbon wire for dislocation and damage.

4.4 Perform carrier shaft maintenance (see Section 1, Basics in the ImageWriter II tab of the Tech Procedures).

5. Replace the Main CPU PCB.

6. Replace the Carrier motor.

ImageWriter II Print Quality Problems

Revised: 11/7/88
Security: Everyone

ImageWriter II Print Quality Problems

=====

This article last reviewed: 2 November 1988

YOU WILL NEED:

1. Level I Tech Procedures for ImageWriter II
2. ImageWriter II User's Manual

BEFORE YOU START:

1. If a replacement module/part doesn't fix the problem, reinstall the original module/part before continuing with the procedure.
2. For location of IW II module/parts or adjustment procedures, refer to the Level I Tech Procedures.

INSTRUCTIONS:

1. Check the paper guide positioning adjustment.
2. Turn off the printer and replace the flexible cable.
3. Check the print head as follows. If it proves defective, replace it.
 - 3.1 Set the digital multimeter to measure 200 ohms resistance.
 - 3.2 Remove the print head and place it PCB side down with the edge connectors facing you. Place one probe on each side of the first edge finger on the right side of the print head. The resistance value should be approximately 3 ohms.
4. Replace the Drive PCB.
5. Replace the Main CPU PCB.

ImageWriter II: Correcting Communications Problems (1/97)

Revised: 1/24/97
Security: Everyone

ImageWriter II: Correcting Communications Problems (1/97)

=====

Article Created: 2 November 1988
Article Reviewed/Updated: 23 January 1997

TOPIC -----

This article describes how to ensure an ImageWriter II printer is functional. This article is designed for service providers who have access to the Level I Tech Procedures for the ImageWriter II printer. However, you can perform the functionality check without the Tech Procedures.

DISCUSSION -----

YOU WILL NEED:

1. Apple IIe computer
2. Super Serial Card
3. Printer cable
4. Level I Tech Procedures for ImageWriter II
5. ImageWriter II User's Manual
6. Pencil and paper

BEFORE YOU START:

- If replacement or adjustment procedures are needed, refer to the Tech Procedures.
- For location of IW II controls, refer to the User's Manual.

INSTRUCTIONS:

1. Connect the printer cable at the back of the IW II.
2. Remove the AppleTalk Option card
3. Check that the top panel is installed correctly.
4. Check that paper is installed.
5. Turn off the printer, write down the customer's Super Serial Card and printer DIP switch configurations. Set the DIP switches as shown below:

(Note: Op = open, Cl = closed, up = On, dn = Off)

IW II	SW1								SW2					
	Op	Op	Op	Op	Op	Cl	Op	Op	Cl	Cl	Op	Op	Cl	Op
	1	2	3	4	5	6	7	8	1	2	3	4	5	6

S/S Card	SW1							SW2							MODEM/TERM
	Off	Off	Off	On	Off	On	On	On	Off	Off	On	On	Off	Off	jumper
	1	2	3	4	5	6	7	1	2	3	4	5	6	7	to term

Note:

On the ImageWriter II, DIP switch 4, on SW2 is OPEN if Localtalk Option card is not installed, and CLOSED if the LocalTalk Option card is installed.

6. Remove all peripheral cards from the IIe. Install the Super Serial card in slot 1. Connect the IW II to the S/S card using a printer cable. Turn on the IW II (make sure cover is installed). Turn on the IIe and press the RESET key while you press the CONTROL key (DO NOT BOOT A DISK). The cursor should blink.

Enter the BASIC program exactly as shown below.

```
10 PR#1
20 FOR A = 1 TO 100
30 FOR I = 32 TO 126
40 PRINT CHR$(I);:NEXT I:PRINT
50 NEXT A
60 PR#0
70 END
```

Enter RUN and press the <RETURN> key. The printer should print out about 100 character sets something like the one shown below:

```
!#$%&'()*+,-./0123456789:;<>?@ABCDEFGHIJKLMNPOQRSTUVWXYZ[\]^_`abcdefghijklmnopqrstuvwxyz{|}
```

* If you get a syntax error on the computer, you may have mis-typed a line. To correct the syntax error perform the following:

- 1) Type LIST and press <RETURN>. The program should appear on the screen.
- 2) Examine the program for accuracy. Spaces, colons, etc. are important.
- 3) To correct a line, simply retype the line and press <RETURN>.
- 4) LIST again to make sure the correction is OK.

* If the IW II prints characters when the program runs, the printer is functional.

* If it doesn't and there is no syntax error on the computer, check for the problems below:

PROB: The printer does not print a set of characters.

FIX: Recheck for the problem after each of the following steps. If no problem is found, go to step 4.

- (1) Check that the computer is properly powered on and initialized.
- (2) Check that the SEL light is on. If it's not, press SEL and try to print from the computer again using the program above. If it prints while the SEL light is off, replace the switch panel.
- (3) Make sure that the interface cable between the printer and the computer is connected and secured at both ends.
- (4) Replace Main CPU PCB.
- (5) Replace printer internal connector cable.

PROB: The printer prints a set of characters but print quality is poor.

FIX: Do a word search for HTS and IMAGEWRITER II and PRINT QUALITY to obtain the print quality FIX.

7. Reset the DIP switches to the customer's original configuration. Then refer to the User's Manual and the Appendix in the ImageWriter II section of the Tech Procedures to see if the customer's DIP switch configuration caused the problem.

Article Change History:

24 Jan 1997 - Corrected DIP settings.

Macintosh 128K, 512K and Plus : Prints All Us to ImageWriter

Revised: 1/30/92
Security: Everyone

Macintosh 128K, 512K and Plus : Prints All "U"s to ImageWriter

=====

Article Created: 24 October 1985
Article Last Reviewed: 17 July 1992
Article Last Updated:

PROBLEM DESCRIPTION: When the print to the ImageWriter is started by the Macintosh in question, the ImageWriter prints all "U"s. The ImageWriter performs the Self-Test OK and works fine with other Macintoshes and computers. This problem occurs with all applications.

CAUSE: The Macintosh is confused.

CURE: Verify that the customer is using "Choose Printer version 1.5" or greater. Previous versions had problems setting ports correctly. If "Choose Printer" revision is OK, do the following:

1. Turn the Macintosh and printer off and on again and recheck for this problem.
2. If the problem remains after step 1, clear Parameter RAM. You can do this by disconnecting the battery inside the Macintosh for about 10 seconds to help the Macintosh forget its improper port configuration. If the problem still is not cured, search on "Macintosh General Troubleshooting".

Macintosh : Bomb and ID=02 Errors On Older Macintosh

=====

Article Created: 24 October 1985
Article Last Reviewed: 17 July 1992
Article Last Updated:

PROBLEM DESCRIPTION: Getting random "Bomb and ID=02" errors on the Macintosh.

CAUSE: Static charge on the old type of CRT is arcing, causing errors.

CURE: Locate the band holding the CRT to the front of the Macintosh. If the band has black tape around it, then it is the old CRT and this fix could work. If an old CRT, put the electrical insulating washers between the front of the Macintosh and each screw holding the CRT band. If the problem still is not saved, search on "Macintosh General Troubleshooting" for additional information.

Parallel Interface Card: Product Description (11/96)

Article Created: 24 October 85
Article Reviewed/Updated: 19 November 1996

TOPIC -----

This article describes the Apple II Parallel Interface card and includes other related information.

DISCUSSION -----

DB-25 Connector Pinout

DB-25

Connector	Signal Name
1.....	Data In, Bit 0
2.....	Signal Ground
3.....	Data In, Bit 2
4.....	Signal Ground
5.....	Data Out, Bit 0
6.....	Data Out, Bit 1
7.....	Blocked
8.....	Data Out, Bit 2
11.....	Data Out, Bit 5
12.....	Data Out, Bit 6
13.....	Data Out, Bit 7
14.....	Data In, Bit 4
15.....	Strobe Out
16.....	Acknowledge In
17.....	Data In, Bit 1
18.....	Data In, Bit 7
19.....	Data In, Bit 5
20.....	Signal Ground
21.....	Data In, Bit 6
22.....	Data Out, Bit 3
23.....	Data Out, Bit 4

24.....Signal Ground
25.....Data In, Bit 3

Switch Settings =====

Strobe Length -----

1 microsecond	-> SW1-1:Off, SW1-2:Off, SW1-3:Off
3 microseconds	-> SW1-1:On, SW1-2:Off, SW1-3:Off
5 microseconds	-> SW1-1:Off, SW1-2:On, SW1-3:Off
7 microseconds	-> SW1-1:On, SW1-2:On, SW1-3:Off
9 microseconds	-> SW1-1:Off, SW1-2:Off, SW1-3:On
11 microseconds	-> SW1-1:On, SW1-2:Off, SW1-3:On
13 microseconds	-> SW1-1:Off, SW1-2:On, SW1-3:On
15 microseconds	-> SW1-1:On, SW1-2:On, SW1-3:On

Strobe Polarity -----

Positive -> SW1-4:Off
Negative -> SW1-4:On

Ack Polarity -----

Positive -> SW1-5:Off
Negative -> SW1-5:On

Firmware Select -----

Parallel (LF) -> SW1-6:Off
Centronics (No LF) -> SW1-6:On

Interrupts -----

Disable -> SW1-7:Off
Enable -> SW1-7:On

Interrupts should be enabled for the Apple III and disabled for the Apple II.

Switch Setting Explanations -----

Different peripherals (non-Apple printers, etc.) may use I/O signals that have different duration and polarity. The STROBE LENGTH, STROBE POLARITY, and ACK POLARITY switch settings on the Parallel Interface Card (2PIC) give you the flexibility to communicate with these other devices. For the I/O signal characteristics of the device you are connecting with, read its manual.

Controlling Bit 8

The following program enables you to control bit 8, used by some printers to select expanded or normal print mode or to enable alternate or graphics character sets. DOS 3.2 or DOS 3.3 is required to use this routine, which also works in the Apple III in Emulation mode.

Determine which slot your interface card is in and the corresponding slot code from the table. Replace "<slot>" with the slot number and "<code>" with the code when typing in the program.

slot	1	2	3	4	5	6	7
code	C1	C2	C3	C4	C5	C6	C7

Enter the monitor with Call -155 and type:

```
3B0:A9 <slot>
:20 95 FE
:A9 80
:20 ED FD
:A9 C5
:85 36
:A9 03
:85 37
:4C EA 03
:29 7F
:0D CD 03
:4C 02 <code>
:80
```

To check your typing, type: 3B0L

Compare your listing to the one below configured for slot 1.

03B0-	A9 01	LDA	#\$01
03B2-	20 95 FE	JSR	\$FE95
03B5-	A9 80	LDA	#\$80
03B7-	20 ED FD	JSR	\$FDED
03BA-	A9 C5	LDA	#\$C5
03BC-	85 36	STA	\$36
03BE-	A9 03	LDA	#\$03
03C0-	85 37	STA	\$37
03C2-	4C EA 03	JMP	\$03EA
03C5-	29 7F	AND	#\$7F
03C7-	0D CD 03	ORA	\$03CD
03CA-	4C 02 C1	JMP	\$C102
03CD-	80	???	

Enter 3D0G to return to Basic.

Save the driver to disk by typing: BSAVE CEN 730, A\$3B0, L\$1E

Load the driver and initialize the interface before using the printer. From command mode, type:

```
BLOAD CEN 730
Call 944
```

Or from a program: 100 Print D\$;"BLOAD CEN 730" : Call 944, assuming that D\$ is a CTRL-D.

To switch back to the video monitor for output type: PR#0
or in a program enter: 200 Print D\$;"PR#0"

To reconnect the printer, all that is required is: Call 954, or from a program:
300 Call 954

To set normal print mode, type POKE 973,0; type POKE 973,128 to set the expanded print mode POKE.

Cable Pinouts

Here is a sample pinout for an Apple II parallel card to a parallel printer.

20-Pin DIL Connector (Female)	Amphenol Connector (Male)
1 -----	14
2 -----	10
8 -----	1
10 -----	2
11 -----	3
12 -----	4
13 -----	5
14 -----	6
15 -----	7
16 -----	8
17 -----	9
20 -----	16

ImageWriter 15 PROBLEM/CURE: Prints Only 8 Wide in Self Test

Revised: 1/30/92
Security: Everyone

ImageWriter 15 PROBLEM/CURE: Prints Only 8" Wide in Self Test

=====

This article last reviewed: 29 April 1988

PROBLEM DESCRIPTION: During Self Test (initiated by turning on printer while pressing Form Feed) the ImageWriter 15 prints character sets only 8 inches wide (it should print test 15 inches wide).

CAUSE: ImageWriter 15 may have the wrong motherboard installed.

CURE: Locate the position for IC 22. If there is a chip installed at that position, then the PCB is for the ImageWriter 15. If not, then the PCB is for the ImageWriter 8.

Parallel/Centronics Card Pin-Out

Revised: 11/7/88
Security: Everyone

Parallel/Centronics Card Pin-Out

=====

This article last reviewed: 2 December 1988

These two cards although different in name, are virtually identical apart from those differences outlined below.

PIN OUTS (same for both cards)

20 Pin Header	Signal Name
1.....	Ground - Pin 1 and 20 must be used.
2.....	ACK (Handshake)
8.....	Strobe out
10.....	Bit 0 (LSB)
11.....	Bit 1
12.....	Bit 2
13.....	Bit 3
14.....	Bit 4
15.....	Bit 5
16.....	Bit 6
17.....	Bit 7 (MSB)
20.....	Ground - Pin 1 and 20 must be used

NOTE: The differences between the two cards are as follows.

CENTRONICS:

The Centronics card is supplied with the PROM P9 (341-0019) installed and does NOT add a linefeed after carriage return. The Jumper block is pre-configured for negative STROBE and positive acknowledge (ACK) signals.

PARALLEL:

The Parallel card is supplied with the PROM P1 (341-0005) installed and does

..TIL01418-Parallel-Centronics_Card_Pin-Out_(TA30783).pdf

add a linefeed after carriage return. With this card you must wire the jumper block yourself. For further information please refer to page 6 of the card's manual.

Apple IIC: External Pinouts (6/94)

Revised: 6/24/94
Security: Everyone

Apple IIC: External Pinouts (6/94)

=====

Article Created: 10 October 1985
Article Reviewed/Updated: 24 June 1994

TOPIC -----

This article describes the pinouts of the Apple IIC computer.

DISCUSSION -----

Joystick

- 1- GAMESW1 Switch input 1 (sometimes called paddle button 1).
- 2- +5V total current drain from this pin must not exceed 100mA.
- 3- GND System ground.
- 4- Not Used for hand controller.
- 5- PDL0 hand controller input. Must be connected to a 150K ohm variable resistor connected to +5V.
- 6- N.C. Not connected.
- 7- GAMESW0 Switch input 0 (sometimes called paddle button 0).
- 8- PDL1 hand controller input; must be connected to a 150K ohm variable resistor connected to +5V.
- 9- Not used with hand controller.

DB-15 Video Expansion Connector

- 1- TEXT Video text signal from TMG; set to inverse of GR, except in double high-resolution mode.
- 2- 14M 14M master timing signal from the system oscillator.
- 3- SYNC* Displays horizontal and vertical synchronization signal from IOU pin 39.
- 4- SEGB Displays vertical counter bit from IOU pin 4; in text mode, indicates second low-order vertical counter; in graphics mode, indicates low-resolution.
- 5- 1VSOUND One-volt sound signal from pin 5 of the audio hybrid circuit

(AUD).

- 6- LDPS* Video shift-register load enable from pin 12 of TMG.
- 7- WNDW* Active area display blanking; includes both horizontal and vertical blanking.
- 8- +12V Regulated +12 volts DC; can drive 300mA.
- 9- PRAS* RAM row-address strobe from TMG pin 19.
- 10- GR Graphics mode enable from IOU pin 2.
- 11- SEROUT* Serialized character generator output from pin 1 of the 74LS166 shift register.
- 12- NTSC Composite NTSC video signal from VID hybrid chip.
- 13- GND Ground reference and supply.
- 14- VIDD7 From 74LS374 video latch; causes half-dot shift high.
- 15- CREF Color reference signal from TMG pin 3; 3.58 MHz.

Note: The signals at the DB-15 on the Apple IIC are not the same as those at the DB-15 end of the Apple III, Apple IIGS, and Macintosh II. Do not attempt to plug a cable intended for one into the other.

Several of these signals, such as the 14 MHz, must be buffered within about 4 inches of the back panel connector--preferably inside a container directly connected to the back panel.

Printer/Modem port

The serial ports on the Apple IIC are standard 5 pin DIN, however, they are not labeled as standard DIN. Therefore, when looking at the back of the Apple IIC, the pinouts are as follows:

5 Pin DIN	Position	Signal Name
1.....	4 O'Clock ...	Data Terminal Ready
2.....	5 O'Clock ...	Transmit Data
3.....	6 O'Clock ...	Signal Ground
4.....	7 O'Clock ...	Receive Data
5.....	8 O'Clock ...	Data Set Ready

PINOUT EXPLANATION

Pin 1 (DTR) becomes active when the IIC is ready to go on line.

Pin 2 (TD) conveys serial data sent from the IIC.

Pin 3 (SG) is used to provide a common ground reference for the electronics in both the IIC and the device it is connected to.

Pin 4 (RD) receives serial data sent from the device to the IIC it is connected to.

Pin 5 (DSR) is asserted by the device the IIC is connected to when it is ready to go on line.

NOTE:

The serial ports on an Apple IIC are essentially identical, the pin connections being the same on both. The main difference being that the printer port is pre-configured for 9600 baud and the communication port is preconfigured for 300 baud. The printer port appears to the software as slot 1, the communication port as slot 2. The settings of these ports can be changed with the Apple IIC System Utilities disk. Please see the System Utilities manual for precise details.

CHARACTERISTICS AT STARTUP

The Apple IIC's ports are configured with keyboard commands instead of DIP switches. After power-up, the IIC sets the printer port to the default configuration given below:

9600 baud

8 data bits and no parity.

2 stop bits.

80 chars per line LF after CR Command character is CTRL-I

Hardware (DTR flow control protocol) handshake.

External Floppy Drive Connector

The Apple IIC external disk drive port is a DB-19 connector. The signals available at the port are as follows:

1 - GND	10 - WRPROT
2 - GND	11 - SEEKPH0
3 - GND	12 - SEEKPH1
4 - GND	13 - SEEKPH2
5 - +12V	14 - SEEKPH3
6 - + 5V	15 - /WRREQ
7 - +12V	16 - NC
8 - +12V	17 - /DR2
9 - /EXTINT	18 - RDDATA
	19 - WRDATA

For more info on how to change a port's configuration, refer to the Apple IIC
Technical Reference Manual.

Apple IIC: Video Port Pin-Out

=====

This article last reviewed: 02 November 1988

This port requires an external PAL modulator to connect to a TV set. It is NOT an RGB port, to connect to an RGB monitor an external piece of hardware is required.

PIN OUTS

15 Pin			
Connector	Signal	Description	
1	TEXT	Video text signal from GLU
2	14M	14MHz Timing signal from master oscillator
3	SYNC	Display synchronisation signal from IOU pin 39.
4	SEGB	Display Vertical counter bit from IOU pin 4.
5	1VSOUND	..	1v sound signal.
6	LDPS	Video shift Register load enable.
7	WNDW	Active area display blanking.
8	+12v	Regulated +12v.
9	PRAS	Ram row address strobe.
10	GR	Graphics mode enable.
11	SEROUT	...	serialized character generator output.
12	NTSC	Composite NTSC video signal.
13	GND	Ground.
14	VIDD7	Causes half dot shift if high.
15	CREF	Colour reference signal

Apple III Port C: RS-232-C Serial Interface And Serial Card 3

Revised: 11/10/88
Security: Everyone

Apple III Port C: RS-232-C Serial Interface And Serial Card 3

=====

This article last reviewed: 2 November 1988

PINOUTS

DB-25 Connector	Signal Name
1	Shield Ground
2	Transmit Data (Tx)
3	Receive Data (Rx)
4	Request To Send (RTS)
5	Clear To Send (CTS)
6	Data Set Ready (DSR)
7	Signal Ground
8	Data Carrier Detect (DCD)
20	Data Terminal Ready (DTR)

NOTE:

Serial Card 3 has a modem eliminator button, when this button is "in" the above pin outs are correct. If the button is "out" this has the effect of a modem eliminator cable being installed.

Apple III Port C: RS-232-C Serial Interface & Serial Card 3 "Driver"

DATA CONFIGURATION BLOCKS

The following table explains how to configure the driver for the RS232 port using the System Configuration Program in the Apple III System Utilities (remember, to set the slot number).

DCB \$00 = BAUD RATE
For BAUD RATE - Set \$00 DCB to:

110	- \$03
134.5	- \$04
300	- \$06

600	-	\$07
1200	-	\$08
1800	-	\$09
2400	-	\$0A
4800	-	\$0C
9600	-	\$0E

DCB \$01 = DATA FORMAT

For Bits Parity - Set \$01 DCB to:

Bits	Parity	
8	none	- \$00
7	odd	- \$22
7	even	- \$26
7	MARK	- \$2A
7	SPACE	- \$2E
6	odd	- \$42
6	even	- \$46
6	MARK	- \$4A
6	SPACE	- \$4E

DCB \$02 thru \$04 = PRINTER DELAYS

Using this driver to connect to a printer may require that you set the delay time then observe the printer while it actually performs the function you want it to delay after (i.e., Carriage Return, Line Feed, Form Feed). If the delay is not adequate you will have to reset it. The delays are given in the range of \$00 to \$FF characters which specify the number of characters that would be sent during the delay specified. After the CR, LF, or FF the RS 232 driver will wait for the time it would take to transmit the amount of characters specified before it sends the following character.

DCB 02 = Delay After Carriage Return

DCB 03 = Delay After Line Feed

DCB 04 = Delay After Form Feed

DCB \$05 thru \$0B = FLOW CONTROL

For protocol - Set \$05 \$06 \$07 \$08 \$09 \$0A \$0B DCBs to:

none	-	\$00						\$00
XON/XOFF	-	\$80	\$13	\$11	\$DF	\$84		\$00
ENQ/ACK	-	\$40	\$05	\$06			\$50	
ETX/ACK	-	\$40	\$03	\$06			\$50	
DTR HW Hndshk-		\$00			\$DF	\$84		\$80

DATA CONFIGURATION BLOCK

Commonly used configurations for the driver .PRINTER on the SOS 1.3 Update diskette are listed in the following table.

Printer	Device configuration block (DCB) values				
	ERRMASK	ERRSTAT	AUTOLF	CTRLWRD	TIMEOUT
	00	01	02	03	04
Centronics 779/700	E0	C0	40	00	0A
Centronics 730/737	C0	C0	00	00	5A
Anadex DP-8000	E0	C0	00	00	5A
Printronic P300	E0	C0	00	00	0A
C.Itoh 8510A	E8	C8	40	00	0A
IDS 440/445/460	60	40	00	00	5A
Epson MX-80	E8	C8	00	00	0A
TI 810	E8	C0	00	00	0A
Any printer connected					
with Apple II cable	00	00	00	00	00

For further information on the Data Configuration Block please refer to page 19 onwards of the Universal Parallel Interface card manual.

NOTE:

The driver .PARALLEL is used for two way communications i.e. for input and output, when using the 40 pin connector. This driver has a three byte configuration block. Please refer to pages 29 onwards in the UPIC manual for more information.

Apple ///: Color Video Port Pinouts (2/95)

Article Created: 28 October 1985
Article Reviewed/Updated: 14 February 1995

TOPIC -----

This article provides a description of the Apple /// color video port.

DISCUSSION -----

DB-15 Connector Signal Description

- | | | |
|----|-------------------|--|
| 1 |Shield Ground | - Establishes electrical ground. |
| 2 |XRGB4 | - One of 4 RGB outputs. Pins 2, 5, 9, & 10 are TTL outputs with instantaneous color information. A linear-weighted sum of these four signals will form a true 16 color RGB video signal. |
| 3 |SYNC | - Composite negative synchronous signal. |
| 4 |PDI | - Not used |
| 5 |XRGB1 | - See pin 2 (one of 4 RGB outputs) |
| 6 |GND | - Power & Signal Ground |
| 7 |-5V | - Maximum load 200 mA |
| 8 |+12V | - Maximum load 500 mA |
| 9 |XRGB2 | - See pin 2 (one of 4 RGB outputs) |
| 10 |XRGB8 | - See pin 2 (one of 4 RGB outputs) |
| 11 |BWVID | - NTSC B&W Composite video with negative going sync, 1 volt peak to peak into a 75 ohm load. |
| 12 |NTSC | - NTSC Color video with negative going sync, 1 volt peak to peak into a 75 ohm load. |
| 13 |GND | - Power & Signal Ground |
| 14 |-12V | - Maximum load 200 mA |
| 15 |+5V | - Maximum load 1 Amp. |

Macintosh Mouse Connector

Pin	Name	Description, Notes
1	CGND	Chassis ground
2	+5V	See hardware Description, Notes for power limits
3	CGND	Chassis ground
4	X2	Horizontal movement line (connected to VIA PB4 line)
5	X1	Horizontal movement line (connected to SCC DCDA- line)
6	N-C	Not connected
7	SW-	Mouse button line (connected to VIA PB3)
8	Y2	Vertical movement line (connected to VIA PB5 line)
9	Y1	Vertical movement line (connected to SCC DCDB- line)

Macintosh Keyboard Connector

Pin	Name	Description, Notes
1	CGNB	Chassis ground
2	KBD1	Keyboard clock
3	KBD2	Keyboard data
4	+5V	

Macintosh External Drive Connector

Pin	Name	Description, Notes
1	CGNB	Chassis ground

2	CGND	Chassis ground
3	CGND	Chassis ground
4	CGND	Chassis ground
5	-12V	
6	+5V	
7	+12V	
8	+12V	
9	N-C	Not connected
10	PWM	Regulates speed of the drive
11	CA0	Control line to send commands to the drive
12	CA1	Control line to send commands to the drive
13	CA2	Control line to send commands to the drive
14	LSTRB	Control line to send commands to the drive
15	WrReq-	Turns on the ability to write data to the drive
16	HdSel	Control line to send commands to the drive
17	Enbl2-	Enables the Rd line (else Rd is tristated)
18	Rd	Data actually read from the drive
19	Wr	Data actually written to the drive

Macintosh RS422 9 Pin Communications Connectors

The following pin connections apply to the interfaces for both the serial communications modem port and the serial printer port on the Macintosh 128K and 512K. If the device being connected to the Macintosh uses RS422 the cable must have pins 4 and 8. If the device uses RS-232 pins 4 and 8 are not necessary.

DB-9 Connector Pin	Signal Name		Comments
	RS-232:	RS-422:	
1	GND	GND	Ground
2	Not used	+5V	Don't use this one; it may be converted into output handshake in later equipment
3	GND	GND	Ground
4	Tx+	Tx+	Transmit Data, positive going component
5	Tx-	Tx-	Transmit data, negative going component
6	+12V	+12V	Use this one only to detect Macintosh power on, not as a power source.
7	DSR	HSK	Handshake input. Signal name depends on the mode: Used for Flow Control or Clock in.
8	Rx+	Rx+	Receive Data, positive going component
9	Rx-	Rx-	Receive Data, negative going component

NOTE:

Macintosh uses pin 7 as an input when communicating to printers in order

to determine whether the printer is ready to receive data (DTR hardware handshaking). Macintosh uses software handshaking for connecting to remote computers or terminals.

The signal range for RS-422 communication is 2 to 6 volts. Refer to EIA Standard RS-422 available from:

EIA Engineering Department
2001 Eye St. N.W.
Washington, D.C. 20006

ImageWriter: First Printed Line Squeezed Into 1/2 Line

Revised: 11/10/88
Security: Everyone

ImageWriter: First Printed Line Squeezed Into 1/2 Line

=====

This article last reviewed: 2 November 1988

PROBLEM DESCRIPTION: When print is initiated, the text of the first line is compressed.

CAUSE: When you tear paper from an older printer, the platen gears may be pulled 1/2 line or so out of alignment -- so that they are between two sprocket positions. This is a normal occurrence and doesn't mean that the printer is broken. During the print head's first pass after this has occurred, the platen will not be positioned properly. At the next pass (the printer may perform several passes for one line of print), the Line Feed motor is activated which turns the platen causing the platen gears to realign for the rest of the print.

CURE: Before printing, turn off the printer and then turn it back on again. This will cause the printer to perform its power-on initialization cycle which activates the Line Feed motor, thereby realigning the platen gears before the print is initiated.

Apple IIc : Won't Boot

Revised: 4/6/93
Security: Everyone

Apple IIc : Won't Boot

=====

Article Created: 19 December 1985
Article Last Reviewed: 17 July 1992
Article Last Updated:

PROBLEM DESCRIPTION: The Apple IIc won't boot.

CAUSE: Two possible causes:

1. Power Supply RFI interfering with the disk drive's ability to read data from disks.
2. Color Monitor RFI interfering with disk drive's ability to read data from disks.

CURE: 1. Check the Technical Procedures "Power Supply Retrofit" to determine if the unit has a Type 1 power supply. If it is Type 1, follow the procedure to install the shield P/N 612-5004 onto the power supply.

2. Check for head shield on internal disk drive. If missing, install per March 1986 Technical Procedures update. A May Service & Support Notice will explain how to obtain reimbursement for this procedure.

If this cure does not resolve the problem, go back to the Word Search screen and search on the product's name and HTS and GTS to obtain a General Troubleshooting procedure.

H-Series ColorMonitor IIC/e P/C: F901 Fuse Keeps Blowing

Revised: 1/30/92
Security: Everyone

H-Series ColorMonitor IIC/e P/C: F901 Fuse Keeps Blowing

=====

This article last reviewed: 15 December 1987

NOTE: Check the serial number. This fix is only for:
ColorMonitor IIEs with S/N less than Y029000
and
IIC ColorMonitors with S/N less than Y048650.

PROBLEM DESCRIPTION: F901 (3.15 amp fuse) on the main logic PCB
of H-Series ColorMonitor IIC and IIEs is blown.

CAUSE: A "special" medium blow higher ampere rating fuse needs to
be installed.

CURE: Contact your local support center and ask them to send you an
upgrade fuse kit.

If this cure does not resolve the problem, go to the Tech Procedures
to obtain a General Troubleshooting procedure.

EtherTalk: Some New Third-party EtherTalk Products for 1988

=====

This article last reviewed: 7 January 1988

The Release 3.0 of the Kinetics FastPath Manager implements EtherTalk/AppleTalk protocols with FastPath. This implementation includes a new load file, named 'etalkgw.srec' which includes EtherTalk support and the combined gateway code. This upgrade includes 3.0 PROMs for the FastPath with enhanced reliability and performance. The upgrade also includes a new network diagnostic/traffic application called 'LANRanger.' EtherTalk/AppleTalk protocol support is also available for the Etherport SC and SE products in a software upgrade for both the SC and SE manager (Release 2.0.). The new software is included with all new Kinetics products.

Alisa System's version of AppleTalk for VMS (Release 1.6) operates with the EtherTalk card for directly connected Macintosh IIs on Ethernet. Release 1.6 also operates with the new Kinetics software managers. A new version of the AlisaTalk file server (Release 3) supports 'remote terminal' function.

In addition, 3Com is said to be working on a new Mac 3+ driver for the EtherTalk card which allows direct connectivity for the Macintosh II under Macintosh OS and the 3Com 3Server using 3Com's implementation of the XNS protocol on Ethernet. This software will be unbundled, allowing a purchaser of an Apple EtherTalk card to buy the software separately.

TOPIC -----

My copy of Font/DA Mover 3.6 works fine when I run it under the Finder, but I have problems when MultiFinder is on.

DISCUSSION -----

Font/DA Mover 3.6 (included with System Tools 5.0) is compatible with MultiFinder. However, the MultiFinder "User's Guide" recommends turning MultiFinder off when your application or desk accessory isn't behaving properly under Font/DA Mover versions earlier than 3.6. The manual specifically recommends turning MultiFinder off when you install or remove fonts or desk accessories. Note that the warning applies only to versions of Font/DA Mover earlier than 3.6.

We recommend you upgrade to a 6.0.x release of Macintosh system software that is compatible with your computer. This would include the current version of the Font/DA Mover. If you want to upgrade to System 7, you won't need Font/DA Mover at all.

See the Tech Info Library for additional guidelines on using MultiFinder and FontDA Mover.

Converting CADAM or IGES Output to a Macintosh

Revised: 7/28/93
Security: Everyone

Converting CADAM or IGES Output to a Macintosh

=====

Article Created: 1 December 1987
Article Reviewed/Updated: 27 July 1993

Lockheed's CADAM system and McDonnell-Douglas' Unigraphics can save files in IGES format. You can then use any of several IGES-to-Macintosh converters to get the file into a Macintosh. (You can also connect directly to the CADAM system using a Tektronix 4014 emulator, such as VersaTerm-Pro.)

The CADMOVER utility (from Kandu Software Corp.) can convert:

- IGES -> Minicad and MiniCad -> IGES
- IGES -> DXF
- IGES -> MacDraw
- IGES -> PICT
- IGES -> MSC/pal

Three Macintosh CAD packages that support IGES file format:

- MGM Station Professional (from Micro CAD/CAM, Inc.)
- EZ-Draft (from Bridgeport Machines, Inc.)
- Minicad (from Diehl Graphsoft, Inc.)

Article Change History:

- 26 July 1993 - Company title updated from Bridgeport Macnines to Bridgeport Machines, Inc.
- 24 March 1988 - Updated for technical accuracy.

AppleWorks: Incorrect volume names cause retrieval problems

=====

If you're having problems retrieving files in Appleworks, make sure that the copies of the Appleworks Startup and Program disk are both named /APPLEWORKS, and that your data disk is not named /APPLEWORKS. Appleworks uses that disk name to identify its program disk, so it can be confused by a program disk without the name /APPLEWORKS, or a data disk with that name.

Macintosh: Licensing the ImageWriter Driver Source Code

=====

This article last reviewed: 26 September 1989

The ImageWriter source code has been made available to developers in order to encourage development and support of complementary products for the Macintosh. Note that the source code will be distributed on an "as is" basis: Apple will NOT be providing technical support for it.

To receive the code, you must submit a one page proposal that describes why you need the software. This proposal must be approved before Apple can grant a license. Upon approval, you will be sent a software license agreement. You must pay a one-time licensing fee to receive the source code.

To license the source code, contact Apple Software Licensing. Search on Software Licensing for address information.

MacWorks: Which Lisa boot ROMs to use

Revised: 8/15/86
Security: Everyone

MacWorks: Which Lisa boot ROMs to use

=====

The same boot ROMs recommended for Lisa software are fine for systems running MacWorks. In addition, square pixel ROMs are available for systems running only MacWorks XL. They are:

SYSTEM	CPU	I/O	Sq PIXELS (CPU-I/O is the same)
Lisa 2/10-Mac XL	F, H	D (88)	A3
Lisa 2	D, H	B (A8)	A3

Although MacWorks has been thoroughly tested with the earlier ROMs, consider upgrading them if a system with earlier ROMs shows illogical errors, such as locked disk errors when initializing a disk, which may occur after loading new system files.

Lisa and Macintosh XL: Restoring Corrupted Parameter Memory

Revised: 7/30/87
Security: Everyone

Lisa and Macintosh XL: Restoring Corrupted Parameter Memory

=====

In the Lisa 2, Lisa 2/5, and Macintosh XL (Lisa 2/10), parameter memory settings are stored in two locations:

parameter RAM on the I/O board, and
the hard disk used for system boot.

In all Lisas and Macintosh XLs, parameter memory in the RAM is held by standby power as long as the machine is plugged in. Only the Lisa 2s and 2/5s have batteries to maintain parameter memory when the unit is unplugged.

The state of parameter memory at any one time depends on which of the following five configurations is true:

1. Configuration:

Neither the system disk nor the RAM has valid settings, such as when the system comes out of the box.

State of Parameter Memory:

The parameter memory will be set when the software is loaded.

2. Configuration:

The RAM does not have valid settings but the disk has, such as after the system is unplugged.

State of Parameter Memory:

The settings on the disk will be copied to RAM during startup.

3. Configuration:

RAM has valid settings but the disk does not, such as when loading software from an old system to a new disk.

State of Parameter Memory:

The settings in RAM will be copied to disk during startup.

4. Configuration:

RAM and the disk have dissimilar valid settings.

State of Parameter Memory:

The settings in RAM overwrite the settings saved on disk.

5. Configuration:

RAM and the disk have identical valid settings.

State of Parameter Memory:

Nothing happens to parameter memory during startup.

Understanding these five possible configurations will help you track down certain problems that may occur with Preferences. For example, if you make the mistake of installing the unofficial Revision C of MacWorks (configuration 1), Preferences somehow gets corrupted in RAM. Under configurations 2 and 3, this corrupted information is copied to the disk. When another disk is started up (configuration 4), the corrupted RAM information is copied onto this disk as well. As a result, there may be no uncorrupted copy of Preferences on any of your disks by the time you notice the problem.

Workaround 1:

1. Unplug the system with the corrupted RAM.
2. Start up MacWorks XL Revision D.

Parameter settings will be copied from MacWorks XL Revision D to RAM, as in Configuration 2 above.

Workaround 2:

1. Unplug the system with the corrupted RAM.

On a Lisa 2 or 2/5:

- a. Leave the system unplugged overnight, or
 - b. Take the I/O board out of the system, turn the battery switch to off, and leave the system for several hours.
2. Find a Profile with a working Lisa OS (Office System or Workshop).
 3. Install a 2-port parallel card in one of the expansion slots.

4. Plug the system back in and start up from the Profile.
5. Select Preferences and make the appropriate changes.
6. Turn the system off.
7. Without unplugging the system (VERY IMPORTANT - just disconnect the Profile from the parallel card), start up the system from the disk with the copy of the corrupted RAM. This copies the parameter memory from RAM onto the disk, restoring the disk copy of RAM.

Apple IIGS: Memory Location of Disassembler

=====

This article last reviewed: 6 January 1988

The Apple IIe's 20-line LIST routine (it begins at address \$FE5E) is not supported in the Apple IIGS.

In the Apple IIGS, a similar location remains a part of the disassemble LIST routine. It is \$F8D0, the INTSDP Display disassembled instruction routine, which displays one instruction pointed to by the program counter. (The \$F8D0 routine is looped through 20 times in the Apple IIe LIST routine.) \$F8D0 can be used in a similar routine on the Apple IIGS.

You may wish to review the Apple IIe routine in order write your own LIST routine. For further information, see the Apple IIGS Firmware Reference Manual and the Apple IIe Technical Reference Manual.

LaserWriter: Getting high-quality output

=====

This article last reviewed: 22 December 1985

When using the LaserWriter to produce camera ready copy, you can improve the results if you follow these guidelines.

Paper:

Use a stock with a smooth finish, such as standard photocopy paper. (Use 16-20 pound stock.) The paper should be white and not glossy. Most offset printers have paper with these characteristics in stock.

Toner density:

LaserWriter cartridges vary in darkness according to how frequently they have been used. For best results, you should avoid using a cartridge that is too black: the increased density fills serifs. We suggest that you print somewhat light. The control knob on the LaserWriter offers some control over density.

After replacing an old cartridge with a new one, you should print several pages to bring the toner up to a good consistent black.

If the LaserWriter prints darker on one part of the page than on another, remove the toner cartridge and roll it gently back and forth to more evenly redistribute the toner.

Jazz: Using it with Finder 4.1

Revised: 11/22/85
Security: Everyone

Jazz: Using it with Finder 4.1

=====

Jazz is shipped with the older version of the Finder (1.1). You can use Finder 4.1 with Jazz if you like, you should not run into any problems. To change to the newer version of the finder, make a copy of the original Jazz Startup Disk that came in your Jazz package and install the new finder on it either by replacing the Finder with 4.1 version or by running Apples Finder Update program.

Note: When replacing the Finder you should startup your Mac with the disk with the newer Finder and then put in the Jazz Startup Disk. Finder 4.1 comes with the Choose Printer desk accessory, which is necessary for the LaserPrinter.

Jazz: Transferring files from AppleWorks

=====

Users have reported success transferring files from AppleWorks into Jazz using a Macintosh file translation program called "First Port". You change your files from DIF files into SYLK files, which Jazz can then Convert into a spreadsheet.

First Port
Desktop Software
Princeton, N.J.
609/924-7111

Lotus does not support this product so you will need to contact Desktop Software if you need help turning your DIF file to SYLK. When you have a SYLK file move it onto a copy of your Jazz startup disk. You will need the file Convert on your disk. This file came on the Jazz Startup Disk that came with your Jazz package. Start Jazz and choose Convert desk accessory. Select your SYLK file, click on SYLK option in the box that will appear and then click on Convert. Your file will automatically open up as a Jazz worksheet, which you can then paste into your Jazz database or word processing.

Using InterBridges on X.25: Packet Traffic & Initializing Info

Revised: 1/13/88
Security: Everyone

Using InterBridges on X.25: Packet Traffic & Initializing Info

=====

This article last reviewed: 16 November 1987

For those using InterBridges to connect an AppleTalk network to an X.25 backbone, this article concerns the rate and size of packet traffic generated by the idle polling of InterBridges across the net, as well as some information on how to initialize this polling.

During the first 30 seconds of polling time, approximately 5-6 packets are transferred between InterBridges. These packets are in ZIP (Zone Information Protocol). The first one is a ZIP bringup packet that comes out of each of the connected ports. ZIP bringup is followed by a ZIP GetZoneList or GetMyZone packet. The GetZoneList is followed by a GetZoneList Reply packet. A newly started InterBridge sends out a ZIP Query for information on packets whose addresses are not yet in its Zone Information Table (ZIT). This ZIP query also is answered with a ZIP reply packet.

The packets range in size: 8 bytes for a ZIP GetZoneList, 45 bytes for a ZIP bringup, 13 bytes plus 32 bytes for each zonename for a ZIP reply packet, and for a GetZoneList Reply there would be 9 bytes and 32 bytes for each zone name. The first group of bytes contain the LAP (Link Access Protocol) header, the DDP (Datagram Delivery Protocol) header, and the ZIP (Zone Information Protocol) header. This holds true for takedown, bringup, query, and reply packets. The ZIP GetzoneList and GetZoneList Reply packets use ATP (AppleTalk Transaction Protocol) header and user bytes. These transactions take place with each connected port. There are 2 AppleTalk ports and 2 Serial ports on the InterBridge. After the initial polling, 1 packet gets transmitted every ten seconds maintains the connection while idling.

To start the bridges communicating, simply turn one on. The InterBridge polls its nearest neighbor, asks it to update its own internal table of zones, then gives the neighbor bridge its zone information. If a bridge happens to be turned off, the bridge's zone table gets rebuilt at power on, which, from that point on, it maintains on its own. Applications communicating over AppleTalk request the zone information from the InterBridge for the user. Bridges periodically update their tables, and upon receiving a new zone address or a

packet referencing an unnamed zone address with a name, the bridge updates its table to reflect the new zone name and address.

There is a problem that may cause some applications not to function on this type of network. Since InterBridges use ZIP, which is "best effort" protocol, this means checking for timeouts and proper data handling must be handled by the application. Some applications, notably AlisaTalk running on a VAX, will time out if delays are very long across the network. These programs operate at the mercy of any other traffic on the X.25 net.

LaserWriter: Shelf Life of Toner Cartridge (11/95)

Revised: 11/17/95
Security: Everyone

LaserWriter: Shelf Life of Toner Cartridge (11/95)

=====

Article Created: 22 November 1985
Article Reviewed/Updated: 16 November 1995

TOPIC -----

What is the shelf life of LaserWriter toner cartridges?

DISCUSSION -----

The shelf life of LaserWriter toner cartridges is approximately 2 years. The end label of each toner cartridge has an expiration date:

Use Before 19XX."

The two-year shelf life of the cartridge is designed to ensure that the print quality will meet Apple's specifications for the expected life of the cartridge.

In other words, the cartridge should be able to withstand storage under the conditions specified on the toner cartridge box and then be able to meet print quality specifications for the rated life of the cartridge.

Since all of our toner cartridges ship in airtight and light-proof bags they are protected from light, humidity, and chemicals such as ammonia-based cleaners that might shorten the life of the cartridge. The one environmental variable that can be controlled is the temperature. Room temperature (+/- 10 degrees F) is an ideal storage environment.

Over time toner tends to settle in the toner bin and may form clumps. These clumps may affect the print quality if they are not broken up prior to use. If you are going to store cartridges beyond the normal shelf life, you should occasionally rock the toner cartridges back and forth to help redistribute the toner and break up any clumps that may be forming. There is no recommended guideline for this, but every six months should be sufficient.

Apple cannot guarantee that the print quality will meet the Apple specifications if the cartridges are stored beyond their normal shelf life.

Color LaserWriter 12/600 PS Shelf Life

=====

The shelf life of the Color LaserWriter 12/600 PS toner cartridge is also 2 years. There is a date code imprinted on each cartridge's box and consists of 6 alphanumeric characters. The first character indicates the last digit of the year, and the second character provides the month that the cartridge was produced. The month date codes are as follows:

A = January
B = February
C = March
D = April
E = May
F = June
G = July
H = August
I = September
J = October
K = November
L = December

Toner Life

=====

For information on how long toner cartridges last once they are installed in a LaserWriter printer, look in the Tech Info Library for the article titled "LaserWriter: Toner Cartridge Life".

Article Change History:

Lisa: Two Port Parallel Card Pinouts

Revised: 7/30/87
Security: Everyone

Lisa: Two Port Parallel Card Pinouts

=====

Two Port Parallel Card
661-93138

PIN	NAME	PIN	NAME
1	GND	14	GND
2	GND	15	PSTRB
3	RW	16	BSY
4	GND	17	CMD
5	DDO	18	PARITY
6	DD1	19	OCD
7	N.C.	20	GND
8	DD2	21	CRES
9	GND	22	DD3
10	GND	23	DD4
11	DD5	24	GND
12	DD6	25	CHK
13	DD7		

The meanings of the individual signals on the interface are:

D0-D7: Eight bidirectional data lines. Bit D7 is the MSB.

DRW: This line is driven high by the Lisa to indicate that data is expected to be input on the data lines. It is driven low to indicate that data is being output.

PARITY: Bidirectional line which must be configured on the basis of the data currently on the data lines to give odd parity.

PSTRB: Processor strobe line used as a signal by the Lisa to indicate valid data being output.

CMD: This line is asserted by the Lisa to indicate that a command has been placed on the data lines.

..TIL01522-Lisa-Two_Port_Parallel_Card_Pinouts_(TA31598).pdf

BSY: This line is asserted by the peripheral to indicate to the Lisa that it is busy and unable to process commands on the interface.

OCD: The Lisa monitors this line. If it is high, it is assumed that no device is connected to the interface.

CRES: This line is asserted by the Lisa when the peripheral is to be reset to its power-on state.

CHK: This signal may be used to interrupt the CPU in the event that a fault condition has occurred in the device connected to the interface.

NOTE: These pinouts apply to both the upper and lower connector of a two port parallel card installed in a Lisa or Macintosh XL.

DAP (Drive Acceptance Program) Documentation

Revised: 1/30/92
Security: Everyone

DAP (Drive Acceptance Program) Documentation

=====

This article last reviewed: 15 December, 1987

NOTE: The DAP (Drive Acceptance Program) is an obsolete diagnostic. It has been replaced with the Apple 5.25 Inch Drive Diagnostic. Refer to the Disk Drives Technical Procedures for complete information on the current Apple 5.25 Inch Drive Diagnostic.

The following article describes how the DAP works and what it is designed to do. For a description of how to run the DAP test or what to replace if a failure occurs, search on "HTS and GTS and the disk drive product name".

TEST SEQUENCE AND DESCRIPTION

1. WRITE PROTECT TEST (the digit 1 appears above the selected drive) -

When the right arrow key is detected, several things happen on the screen. The diskette icon is erased, the drive door icon flashes to a closed position, and the IN.USE lamp icon lights as the first test begins. The digit "1" appears above the drive to indicate the test step.

The write protect test reads and saves a copy of sector 5 on track 16 of the test diskette. This helps prevent accidental data loss if the wrong diskette is accidentally inserted. The write-protect test does not bother with the write-protect switch since this may differ in various drives and controllers. Rather, it attempts to write a sector and then reads the sector back. If the read detects the data pattern written, the drive is failed in step one. In the case of failure (i.e. the write is successful) the original sector is re-written to the diskette. If writing does occur, the big "X" fail sign is overlayed on the drive image. This same indication is used for failure of any of the remaining tests.

2. WRITE AND READ TEST -

A. SPEED (The digit 2 appears): The first write test makes 16 D-SPEED passes over track 30. The test is self-adjusting, allowing a variance of ± 26 WOZ counts for Apple II+, IIe and IIC systems, and ± 10 WOZ counts for the Apple III in emulation mode. (If the test fails at the beginning of the test, the drive circuitry may be unable to read/write.)

B. WRITE AND VERIFY TRACKS 31,32,33 (The digit 3 appears): The write test writes patterns to all sectors of tracks 31,32,33 and then attempts to read the track. After each read it compares the read data pattern to the pattern written to verify a good write and read.

3. DYSAN DDD DISKETTE TESTS -

A. SPIN ECCENTRICITY (spindle wobble, collet problems; displays digit 4): Tests tracks 21 and 24. An even amount of error has been encoded on each of these DDD tracks. A properly centered head should read each sector with equal ease or difficulty. Irregularity here generally indicates collet problems or possibly spindle wobble. The program allows for some errors. If the test shows more failures than the limit allows, the user will be prompted to re-insert the DDD. On Disk II and Disk III drives it is best if the DDD is "double clamped". Failure here can also indicate excess noise from nearby equipment or a worn DDD diskette.

B. RADIAL ALIGNMENT (head properly centers on track; displays digit 5): This test reads tracks 0, 5, 16, 19, 30 and 32. Each of these tracks has been encoded with errors which are progressively further from the center track (by one mil) with each sector. A properly aligned drive will have a diminishing ability to read sectors and a perfectly positioned head will be unable to read the sectors furthest away from the center of the track. (Since the Digital Diagnostic Diskette checks alignment at six locations, it is possible that the error will not be detected with the Disk Alignment Aid.)

C. HYSTERISIS (physical slope in arm motion; displays digit 6): This test calibrates the drive, reads tracks 5 and 30, goes to track 34 and then reads tracks 30 and 5. A properly adjusted and functioning drive will not develop more than ± 2 mils of error on reads when the head moves from the opposite direction. Errors discovered here are due to physical slop or wear in the hardware. Failure of this test can often indicate that the guide rails need cleaning.

D. AZIMUTH (ability of head to detect data with 21-42 minutes of error in the angle of data placement; displays digit 7): This test calibrates and moves to track 34. This track has been encoded with data written with angular error which alternates direction with each sector and increases from 21 to 42 minutes of error. The inability to read this data indicates a faulty head. In most cases all sectors are read easily by the heads in Apple drives.

III E-Z Pieces: Using it on an Apple III with Catalyst

Revised: 9/27/91
Security: Everyone

III E-Z Pieces: Using it on an Apple III with Catalyst

=====

Article Created: 5 December 1985
Article Last Reviewed: 27 September 1991
Article Last Updated: 27 September 1991

TOPIC -----

The following information provides information on using III Easy Pieces on an Apple III with Catalyst.

DISCUSSION -----

You may move III Easy Pieces version 1.0 (Haba Systems Inc.) to a hard disk for use with Catalyst. These instructions assume you are moving III Easy Pieces to a ProFile (with driver name .PROFILE). Substitute the name of your hard disk driver for .PROFILE if you wish to install III Easy Pieces on a different hard disk.

COPY PROCEDURE:

1. Boot the Catalyst diskette (if you haven't already).
2. From the Catalyst main menu, select the System Utilities Program.
3. Enter "F" for FILE HANDLING COMMANDS.
4. Enter "M" for MAKE A NEW SUBDIRECTORY.
5. Enter "THREE.EP" with a default size of 25 files.
6. Press "ESCAPE".
7. Enter "C" for COPY FILES.
8. Copy all files from the III EASY PIECES BOOT disk to the subdirectory "THREE.EP/" except for the following:

SOS.KERNEL SOS.DRIVER

To do this, type ".D1/" and press the up arrow key. A list of files are displayed in a box. The up and down arrow keys allow you to move an inverse bar over the name of your choice. Pressing the right arrow key marks the file so as to include it in the copy process. Mark all files to be copied

in this way. When all files are marked, press RETURN.

9. Copy all files from the PROGRAM disk in the same manner as above to the subdirectory "THREE.EP".

10. When all files have been copied, press ESCAPE.

ADDING III EASY PIECES TO THE CATALYST MENU

1. Return to the Catalyst main menu.

2. Select the Catalyst Editor.

3. Enter "E" to edit the menu.

4. Use the up and down arrow keys to position the inverse bar over the entry you want the program to precede. Press "A" to ADD a program entry.

5. You will be asked for the display name of this program, enter "THREE EP"

6. Enter "THREE.EP/SOS.INTERP" as the interpreter path name.

7. You will be asked if you want "EXTRA DRIVERS". Press RETURN.

8. Press RETURN for standard character set.

9. Press RETURN for the normal screen.

10. Press RETURN for the default keyboard.

11. Enter "/PROFILE/THREE.EP" for the initial prefix.

12. Enter "0" for the "Max Files Allowed..." question.

13. Press RETURN for the program path.

14. You will be asked if this entry is correct. If it is, enter "Y" then press ESCAPE to exit to the main edit menu. If you made any mistakes during entry, enter "N". You may then enter the number of the item you wish to correct. When all items are correct, press ESCAPE. Press ESCAPE again to exit to the main edit menu.

15. Enter "5" to update the INTERPS file. When you are asked if you want to recalculate the load address, enter "Y".

16. Exit to the Catalyst main menu by entering "Q".

As of September 27, 1991, Apple Computer, Inc. cannot locate a current phone number for Haba Systems. We believe they have gone out of business.

Access III: Installing it on a hard disk

Revised: 12/5/85
Security: Everyone

Access III: Installing it on a hard disk

=====

You may move ACCESS III (Apple) to the hard disk. This will allow you to access it with greater ease than using floppy diskettes. Parts of this installation procedure require a limited knowledge of the BASIC language.

COPY PROCEDURE:

- 1) Boot the CATALYST disk (If you haven't already).
- 2) From the main CATALYST menu, select the System Utilities Program.
- 3) Press "F" for File Handling Commands.
- 4) Press "M" for Make a New Subdirectory.
- 5) Enter ".PROFILE/CATALYST/APPLCOM".
- 6) Press RETURN to accept the default size of 25 files.
- 7) Press ESCAPE.
- 8) Put the PROGRAM diskette in the internal drive.
- 9) Press "C" to Copy files.
- 10) Copy all files on your PROGRAM diskette except for the following:
SOS.KERNEL SOS.DRIVER SOS.INTERP SYSTEM.MISCINFO
- 11) To do this, type ".D1/" and press the up arrow key.
- 12) A list of files are displayed in a box. The up and down arrow keys allow you to move an inverse bar over the name of your choice. Pressing the right arrow key marks the file so as to include it in the copy process. Mark all files to be copied in this way. When all files are marked press RETURN.
- 13) Enter ".PROFILE/CATALYST/APPLCOM/=" as the name of the destination file.
- 14) When all files have been copied, press ESCAPE.

ADDING ACCESS III TO THE CATALYST MENU

- 1) Enter the number for CATALYST EDIT.
- 2) Enter "1" to add an entry to the menu.
- 3) Enter the number of the menu entry you want ACCESS III to precede.
- 4) You will be asked for the display name of this program. Enter "ACCESS III".
- 5) Enter CATALYST/BASIC for the interpreter path name.
- 6) Press RETURN for the character set pathname.
- 7) Press RETURN for standard character set.
- 8) Press RETURN again to use the default keyboard.

- 9) Enter ".PROFILE/CATALYST" as the default prefix.
- 10) Enter "3" for the "Max files allowed..." question. It is suggested that the QUIT option be used to exit to BASIC then use the double apple escape to exit to the CATALYST main menu.
- 11) Enter ".PROFILE/CATALYST/APPLCOM,ACCESS3" when you are asked for the program path.(This will give you a BAD PATH error but ignore it).
- 12) You will be asked if this entry is correct. If it is, enter "Y", or just press RETURN. You will be allowed to insert another entry. Since you do not want to do this, enter "0" to exit to the main menu.
- 13) Enter "7" to update the INTERPS file. When you are asked if you want to recalculate the load address, enter "N".
- 14) Exit to the CATALYST main menu by entering "0".

ADDITIONAL INSTRUCTIONS

To complete the installation of ACCESS III you must modify the short Basic program "ACCESS3" which is located on the PROGRAM diskette. To do this you must have access to Apple Business Basic or a program that BASIC can be invoked from.

- 1) Boot Apple Business Basic.
- 2) Load ".PROFILE/CATALYST/APPLCOM/ACCESS3".
- 3) List "ACCESS3".
- 4) Delete lines 10 and 15.
- 5) Change line 20 to read "INVOKE".PROFILE/CATALYST/APPLCOM/ACCESS3.INV".
- 6) Add line 25 "PREFIX\$= ".PROFILE/CATALYST".
- 7) Delete line 40.
- 8) Save ".PROFILE/CATALYST/APPLCOM/ACCESS3".

Now ACCESS III is completely configured for CATALYST.

AppleWorks: RamWorks Card Needs Larger Memory Capacity (9/95)

Revised: 9/19/95
Security: Everyone

AppleWorks: RamWorks Card Needs Larger Memory Capacity (9/95)

Article Created: 5 December 1985
Article Reviewed/Updated: 19 September 1995

TOPIC -----

This article describes how to interface Catalyst With An Apple II, AppleWorks & RamWorks IIe 80-column Card.

DISCUSSION -----

This technical note describes the procedure to correctly interface the above products to allow larger memory capacities with the AppleWorks application.

What You Need

=====

Before you begin, be sure you have the following:

1. ProDOS users disk.
2. Desktop Expander disk from Applied Engineering.
3. AppleWorks startup and program disks.
4. Catalyst disk.

Procedure

=====

Step 1

Boot the Desktop Expander disk and follow the instructions. This will modify your AppleWorks disk so that it can use the additional memory of the Ramworks board IIe card.

Step 2

Create a subdirectory on your hard disk using Apple's ProDOS Users disk called

" /PROFILE/AW"

Step 3

Copy all of the files from the AppleWorks Startup and Program disks to the subdirectory you just created.

Step 4

Once the files have been copied, start up your Catalyst disk and select the Catalyst Editor.

Step 5

Move the cursor to the point where you wish to add your AppleWorks program and press "A".

Step 6

Type "APPLEWORKS" for the program name.

Step 7

Type "AW/APLWORKS.SYSTEM" for the interpreter pathname.

Step 8

Type "AW" for the initial prefix.

Step 9

Press RETURN for the program path.

Step 10

You will be asked if all items are correct. Answer "Y" and press ESCAPE to exit to the main menu.

Step 11

Enter "U" to update the INTERPS2E file.

Step 12

Exit to the Catalyst main menu by entering "Q".

When you select the AppleWorks program from the main menu you will notice that you now have 101K available for data storage.

NOTE: Apple Computer Inc. is not responsible for the contents of this article.

BPI: Installing it on Catalyst for the Apple III (1 of 2)

Revised: 12/5/85
Security: Everyone

BPI: Installing it on Catalyst for the Apple III (1 of 2)

=====

These instructions assume you have Version 2.0 or greater of BPI and that you have installed it on the ProFile according to the BPI Manual. This will allow you to place all of the programs for BPI on the ProFile and eliminate any need for the floppy disks. The BPI General Accounting Software uses most of the 256K of memory available in the Apple III. Catalyst 2.0 is designed to have all of the necessary drivers, Apple III Pascal options, and graphics space allocated so all the application programs can work. Therefore, since the memory space is limited, the SOS.DRIVER file must be kept to a minimum and NO graphics drivers can be installed. The following driver list should be adequate:

.CONSOLE	.QUARKCOM
.PRINTER or .SPOOL	.UNUSED 1-6
.CATALYST	
.PROFILE	

NOTE: You may conserve an additional 6K of memory by selecting the QUIT option from the SYSTEM UTILITIES main menu. This will take you to the Pascal Command Line. Select "O" and a menu will be displayed. Select option "B" and make the Apple II disk routines NOT resident. Once this is completed, press "Q" to quit.

These instructions assume you are moving BPI to a ProFile (with the driver name of .ProFile), and that Catalyst is installed. Substitute the name of your hard disk driver for .PROFILE if you wish to install BPI on another brand of hard disk.

COPY PROCEDURE:

1. Make certain that there is a .ProFile driver installed on the System utilities disk.
2. Boot the System Utilities disk.
3. Press "F" for File Handling Commands.
4. Press "M" to Make a New Subdirectory.
5. Enter ".PROFILE/BPI/BPI.TRAPOFF".
6. Press RETURN to accept the default size of 25 files.
7. Press ESCAPE.

8. Press "M" to Make a New Subdirectory.
9. Enter ".PROFILE/BPI/INSTALL".
10. Enter "3" when it asks for the number of files.
11. Press ESCAPE.
12. Put the BPI SYSTEM diskette in the internal drive.
13. Press "C" to Copy Files.
14. Copy the files SYSTEM.STARTUP and SYSTEM.STAR.LIB from your BPI SYSTEM diskette to the subdirectory ".PROFILE/BPI/=".

To do this, type ".D1" and press the up arrow key. A list of files are displayed in a box. The up and down arrow keys allow you to move an inverse bar over the name of your choice. Pressing the right arrow key marks the file so as to include it in the copy process. Mark all files to be copied in this way. When all files are marked, press RETURN.

15. Put the BPI INSTALL diskette in the internal drive.
16. In the same manner as above, copy the files SYSTEM.STARTUP, SYSTEM.STAR.LIB, and BPI.CNF from your BPI INSTALL diskette to the subdirectory ".PROFILE/BPI/INSTALL/=".

BPI: Installing it on Catalyst for the Apple III (2 of 2)

Revised: 12/5/85
Security: Everyone

BPI: Installing it on Catalyst for the Apple III (2 of 2)

=====

ADDING BPI TO THE CATALYST MENU

1. Boot the Catalyst diskette.
2. Select the Catalyst Editor in the Catalyst main menu.
3. Enter "E" to edit the Menu.
4. Place the cursor to the position you want the menu entry location for BPI to be.
5. Press "A". You will be asked for the display name of this program. Enter "BPI".
6. Enter "CATALYST/PASCAL" for the interpreter pathname.
7. Press RETURN for the extra drivers question.
8. Press RETURN to use the default character set pathname.
9. Press RETURN for the standard character set.
10. Press RETURN again to use the default keyboard.
11. Press RETURN to accept the default prefix.
12. Press RETURN for the "Max Files Allowed..." question. This will allow the program to be exited only by the QUIT option in BPI. This procedure is suggested due to the fact that files and/or data may be lost if the double Apple escape option is used. You may exit to the Catalyst main menu by entering "Q" from the Pascal command line.
13. Enter "BPI/SYSTEM.STARTUP" when you are asked for the program path.
14. You will be asked if this entry is correct. If it is answer "Y". You will be allowed to insert another entry. You do want to do this, enter "1" to add the next program.
15. Place the cursor to the position you want the menu entry location for BPI}Install.
16. Press "A". You will be asked for the display name of the program. Enter "BPI Install".
17. Enter "CATALYST/PASCAL" for the interpreter pathname.
18. Press RETURN for extra for the extra drivers question.
19. Press RETURN to use the default character set pathname.
20. Press RETURN for the standard character set.
21. Press RETURN again to use the default keyboard.
22. Press RETURN to accept the default prefix.
23. Enter "0" for the "Max Files Allowed..." question .
24. Enter "BPI/INSTALL/SYSTEM.STARTUP" when you are asked for the program path.
25. You will be asked if this entry is correct. If it is answer "Y". You will

be allowed to insert another entry. You do not now want to do this, enter "0" to exit the program.

26. Enter "5" to update the "INTERPS" file. When you are asked if you want to recalculate the load address, enter "N".

27. Exit to the CATALYST main menu by entering "Q".

Additional Instructions

1. Choose the option for BPI Install. Once you are at the BPI System Installation Menu, choose option 1, "Check System Device Status. The BPI Install program finds the new subdirectory and modifies itself to run from the ProFile rather than from the internal drive. End the Install program by entering "5". The following message will appear:

Current System Does Not Match System Data On Disk

Press RETURN to clear the message, and follow the instructions on the screen to insert the BPI Install and System Disks. This MUST be done. When this process is finished, you will be returned to the Catalyst 2.0 main menu. BPI is now set to begin execution.

RECOMMENDATIONS

1. Always exit BPI through the main menu by selecting "End BPI Systems". Do not end data entry by turning off the machine. This will insure the integrity of your data files.

2. Keep your drivers in the SOS.DRIVER to a minimum. If this is not done, a "stack overflow error" may occur and BPI will not work.

NOTE: Apple Computer Inc. is not responsible for the contents of this article.

Catalyst: Using it with an Apple III and QC Hard Disk

Revised: 12/5/85
Security: Everyone

Catalyst: Using it with an Apple III and QC Hard Disk

=====

Catalyst will take full advantage of the QC hard disk provided that minor modifications to the .CATALYST device driver are made. A partial discussion of this modification is located on page 4-9 of the QC manual. Below are additional steps that must be completed in order to insure complete compatibility.

PREREQUISITES:

Catalyst for the Apple III

Special DCB values in the .CATALYST device driver are required in order for the Catalyst for the Apple III to take advantage of this feature. The first 6 bytes (0-5) are device specific and can be determined by following the instructions on page 4-9 of the QC manual. The bytes are assigned as follows:

BYTE	ASSIGNMENT
0	Slot Number
1	Unit Number
2	Device Type
3	Device Subtype
4	Manufacturer ID (low byte)
5	Manufacturer ID (high byte)

Bytes 6-17 are checksum bytes. Their values must correspond to the following:

	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
0x	0S	UU	TT	ST	MM	MM	00	8F	97	8A	91	93	23	17	17	F6
1x	00	B8														

EXAMPLE OF THE ".CATALYST "DRIVER DCB USING THE QC-10 DEVICE ".Q1":

00 00 F1 AA 23 00 00 8F
97 8A 91 93 23 17 17 F6
00 B8

Catalyst: Integrating it for an Apple III and Corvus Omnidrive

Revised: 12/5/85
Security: Everyone

Catalyst: Integrating it for an Apple III and Corvus Omnidrive

=====

Either a single user or an multi user system may be integrated with the Catalyst for the Apple III provided that the items below are completed. It is assumed that you have initialized your Corvus hard disk, with the SOS format, according to the Corvus Disk System Installation Guides and have performed the following:

1. Update firmware.
2. Generation of a Constellation II system.
3. Addition of the Constellation Utilities.
4. Creation of a volume.
5. Creation of a "User"
6. Grant "User" access to the volume.

For the purposes of these instructions, a Catalyst volume was created, formatted, and mounted on .C2.

Once you have set up your Corvus drive for use, it will be necessary for you to add the Corvus device drivers (.C1-.C6 .CRDW .CORBOOT) to your Catalyst disk. To do this, use the System Configuration Program within Apple's System Utilities to read the device drivers of your Catalyst program disk into memory. Once this is completed, add the Corvus drivers contained in the files A3DRV.BOOT.CODE and A3DRV.SOS.CODE to the existing driver file. These files may be found on the Corvus A3C2.2 diskette. If you are unfamiliar with the procedures necessary to complete the above, consult your Apple Standard Device Drivers Manual for details.

NOTES ON THE MODIFICATION OF THE CATALYST SOS DRIVER FILE

1. In order for Catalyst to work along with the Constellation boot driver .CONSTBOOT it is necessary to remove the Quark .CONSOLE driver and replace it with an Apple .CONSOLE driver. The Apple .CONSOLE driver may be found on any Apple System Utilities Disk. In doing this, the Double Apple ESCAPE option within Catalyst will be disabled which will force you to quit each application installed on the Catalyst by use of a QUIT menu option within each application. The replacement of the Quark .CONSOLE driver will also make Quark's printer spooler Discourse unusable. Discourse uses special attributes

of Quark's .CONSOLE driver that are unavailable with the Apple driver.

2. RECOMMENDATION: The Catalyst SOS.DRIVER file contains 18 device drivers with 18K of space remaining. It is possible to add the Constellation II drivers to the Catalyst, however, it may cause a \$01 error. This is due to the fact that the driver file, once the Corvus drivers are added, approaches the maximum memory limit. To avoid this, refer to the section in the Catalyst manual dealing with "EXTRA DRIVERS". The following drivers may be deleted to keep the driver list on the Catalyst disk to a minimum:

.AUDIO .RS232 .GRAFIX .PRINTER .FMTD-1 through 4

In order for Catalyst to recognize the Corvus Device it is necessary to modify the .CATALYST Device Configuration Block (DCB).

3. When setting up the .CATALYST driver DCB, Byte 01 will vary depending upon the Corvus driver you are using. For example, .C2 has a unit number of "01". If you wish to use this device, Byte 01 in the Catalyst DCB must be set to "01". Device .C3 has a unit number of "02". If you wish to use this device, Byte 01 in the Catalyst DCB must be set to "02". The .C1 device is the System Manager and is not to be used by Catalyst.

Example of the .CATALYST DCB using the .C2 device, slot 4:

	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
0x -	04	01	F1	01	02	00	00	8F	97	8A	91	93	23	17	17	F6
1x -	00	B8														

Once steps 1-3 have been completed, Generate a New System on your Catalyst Boot disk.

SCENARIO

Assuming that the above procedures have been performed, booting the Catalyst disk will activate the driver .CONSTBOOT. The Constellation main menu will appear. Type the user name you created for your Catalyst volume and your password. The Catalyst will now boot through the built in drive and you will be presented with the Catalyst main menu.

You may at this point install the Catalyst system, by following the instructions on page 2-6 of your Catalyst manual.

ERRORS:

SYSTEM FAILURE \$05 - The Catalyst contains a Quark .CONSOLE driver. Use the Apple System Utilities to delete it and replace it with an Apple .CONSOLE DRIVER.

NOTE: Apple Computer Inc. is not responsible for the contents of this article.

Catalyst: Integrating it for a Ile and Corvus ProDOS Omnidrive

Revised: 12/5/85
Security: Everyone

Catalyst: Integrating it for a Ile and Corvus ProDOS Omnidrive

=====

The information below assumes that you are totally familiar with the commands and terminology of the Corvus ProDOS System Manager and the constellation system that was included with your Corvus Omnidrive. Incidentally, the instructions below are also compatible with any copy protected software application. Any problems with this installation of the Catalyst system should be referred to Quark Technical Support.

NOTE: Most protected software will only run from slot #6. In most cases, the Transporter card must be in slot #7 and the floppy controller card will reside in slot #6. When creating and mounting volumes, do so on logical drive 1. (eg. slot 5, drive 1.)

PROCEDURE

1. Boot the Corvus System Manager software. At the prompt, type "A2MGR" and press RETURN.
2. Create a ProDOS "user" and format it using the PRODOS FILER. Once the "user" has been created, give it write access to a volume that is to be used for data storage.
3. Boot the Corvus. You will be presented with a prompt stating "NO .SYSTEM FILE PRESENT"
4. Press CONTROL RESET which will take you to the monitor level. An asterisk "*" prompt will appear.
5. Place the Catalyst disk in the floppy drive with the write protect tab removed. Press the 6 key, the CONTROL key, and the P key (read 6 control P) and RETURN. You will be presented with the Catalyst menu . At this point follow the instructions in the Catalyst manual starting with step 5 to complete the Catalyst installation.

NETWORK NOTES:

Catalyst will accept any ProDOS compatible mass storage device including those that support a network environment provided that the user purchase separate copies of software that is copy protected for each node of the network. For example, if you have a Corvus Omninet system with six work stations using VisiCalc, it will be necessary to purchase six separate VisiCalc

packages and six Catalyst packages in order to use the Omninet with in the guidelines of the agreement. Under NO circumstances will two or more Catalyst packages be sold with identical serial numbers. This will necessitate the creation of a separate volume within the network for each network node. This volume will contain the copy protected programs used by Catalyst.

Great Plains Accounting: Using it on an Apple III with Catalyst

Revised: 12/5/85
Security: Everyone

Great Plains Accounting: Using it on an Apple III with Catalyst

=====

You may move Great Plains Accounting software to the hard disk provided that you have version 3.00.

WARNING: Great Plains assumes that you are using a hard disk with a device driver named ".PROFILE". If you are using another brand of hard disk, rename the device driver accordingly.

Begin by following the LOAD TO HARD DISK PROCEDURE for the ProFile outlined on page 2-4 of the Great Plains module manual of your choice. Complete all steps, then follow along below. Do not continue on to "ENTERING COMPANY DATA" yet.

NOTE: As you copy the Great Plains files to your hard disk from GPS1 you will be asked if you wish to replace the file .PROFILE/SYSTEM.MISCINFO. Answer "NO" to this question. The file will be skipped by System Utilities.

COPY PROCEDURE:

1. Boot your CATALYST disk (if you haven't already.)
2. Select the Catalyst Editor in the Catalyst main menu.
3. Enter "4" to move Great Plains to the hard disk.
4. You will be asked to put the disk containing the interpreter in the internal disk drive and press the space bar. Insert the Great Plains BOOT disk and press the space bar.
5. You will be asked for the hard disk pathname of the interpreter. Enter "CATALYST/GRTPLN.INTERP".
6. The Great Plains interpreter will be copied to your hard disk.

ADDING GREAT PLAINS ACCOUNTING SOFTWARE TO THE CATALYST MENU

1. Select the Catalyst Editor in the Catalyst main menu.
2. Enter "E" to edit the menu.
3. Use the up and down arrow keys to position the inverse bar over the entry you want the program to precede. Press "A" to add a program entry
4. You will be asked for the display name of this program. Enter "GREAT PLAINS".

5. Enter "CATALYST/GRTPLN.INTERP" as the interpreter pathname.
6. You will be asked for a list of any extra drivers this program requires.
Press RETURN.
7. Press RETURN for the character set pathname.
8. Press RETURN for standard character set.
9. Press RETURN again to use the default keyboard.
10. Press RETURN to accept the default prefix.
11. Press RETURN for the "Max Files Allowed... question. This will allow the program to be exited only by the QUIT option of Great Plains. This procedure is suggested due to the fact that files and /or data may be lost if the double Apple escape option is used.
12. Press RETURN for the program path.
13. You will be asked if this entry is correct. If it is, enter "Y" then press ESCAPE to exit to the main menu. If you made any mistakes during entry, enter "N". You may then enter the number of the item you wish to correct. When all items are correct, press ESCAPE. Then press ESCAPE again to exit to the main menu.
14. Enter "5" to update the INTERPS file. When you are asked if you want to recalculate the load address, enter "N".
15. Exit to the CATALYST main menu by entering "Q".

Once these steps have been completed, select the number for Great Plains from the CATALYST menu. When the welcome screen appears,press RETURN and continue the installation process outlined on page 2-6 of the Great Plains manual.

NOTE: Multi-company operation of the Great Plains Accounting package can be accomplished by deleting GRTPLN.DATA from the main directory level of your ProFile. This will force Great Plains to look for that file on .D1. In this way you can create a separate boot diskette for each company as outlined in the appendix of your manual and swap disks as necessary prior to invoking Great Plains via Catalyst.

Pascal 1.2 128K Development System: Using it with a QC Hard Disk

Revised: 12/5/85
Security: Everyone

Pascal 1.2 128K Development System: Using it with a QC Hard Disk

=====

If you are fortunate enough to own the Pascal 1.2 development system you can access all features of it from your QC hard disk. The 128K development version is REQUIRED.

It is assumed that you are familiar with the Pascal development system and the workings of the Apple II Pascal Software supplied with your QC hard disk.

PROCEDURE

1. Create a development version of the Apple Pascal II software disk using the procedure on page 1-4 of the Quark Hard Disk Drive Pascal II Users Manual. In addition to these steps, it is necessary to convert the software from a 64K development version to a 128K development version. To do this place the APPLE3 Pascal disk in the disk drive and T(ransfer "APPLE3:128K.APPLE" and "APPLE3:128K.PASCAL" to "QUARK:SYSTEM.APPLE" and "QUARK:SYSTEM.PASCAL" on the Apple II Pascal software disk. When asked to remove old files, answer "Y".
2. Make a copy of the APPLE1 disk and convert this disk to a 128K development version by T(ransferring APPLE3:128K.APPLE and APPLE3:128K.PASCAL to APPLE1:SYSTEM.APPLE and APPLE1:SYSTEM.PASCAL. When asked to remove old files answer "Y".
3. Boot the newly modified Apple IIPascal Software disk.
4. From the main menu select the VOLUME MANAGER.
5. Select CREATE VOLUMES and make a PASCAL II volume on your QC hard disk that is 800 blocks in size. Mount this volume with Read/Write access by pressing RETURN at the prompt "OK to allow unrestricted access to this volume?".
6. Return to the VOLUME MANAGER main menu and select EDIT CURRENT MOUNTS.
7. Set up the newly created Pascal II volume to currently mount on unit #5. Mount this volume with Read/Write access by pressing RETURN at the prompt "Mount with Read/Write access?".
8. Return to the VOLUME MANAGER main menu and select QUIT.
9. Select RENAME VOLUME and change the volume name to anything you wish.
10. Return to the Pascal QC Hard Disk Utilities menu and select QUIT TO PASCAL.
11. Insert the 128K APPLE1 in the disk drive and select F(iler.
12. Select T(ransfer. Copy the entire contents of APPLE0, APPLE1, APPLE2, and APPLE3 to "#5:=". Certain files, particularly SYSTEM.APPLE and SYSTEM.PASCAL and SYSTEM.COMPIILER are duplicated throughout these disks. When asked to remove

old files, answer "N".

13. Place the APPLE3 disk in the disk drive. T(ransfer the files "APPLE3:128K.APPLE" and APPLE3:128K.PASCAL" to "#5:SYSTEM.APPLE" and #5:SYSTEM.PASCAL". When asked to remove old files, answer "Y".

14. Insert the Apple II Pascal Software disk in the disk drive and T(ransfer "QUARK:=" to "#5:=". When asked to remove old files answer "N".

FINISHING UP

1. Boot the Apple II Pascal Software disk and select VOLUME MANAGER.
2. Select EDIT CURRENT MOUNTS. Mount your Pascal II volume on unit #4 by selecting "1" and pressing RETURN. Respond to the prompt "Mount which volume?" by typing the name of your Pascal II volume and pressing RETURN. Mount this volume with Read/Write access by pressing RETURN at the prompt "Mount with Read/Write access?".
3. Return to the VOLUME MANAGER main menu and select EDIT AUTOMATIC MOUNTS.
4. Auto mount your Pascal II volume on unit #4 by selecting "1". Respond to the prompt "Mount which volume?" by typing the name of your Pascal II volume and pressing RETURN. Mount this volume with Read/Write access by pressing RETURN at the prompt "Mount with Read/Write access?".
5. Reboot the Apple IIPascal Software disk. You will notice that after the initial boot, all files are being accessed from the QC hard disk. Surprise.... You will be able to access both Apple II Pascal Software files from your hard disk and by quitting to Pascal, will be able to access all Pascal development tools without rebooting.

Word Juggler: Printer Filters

Revised: 12/5/85
Security: Everyone

Word Juggler: Printer Filters

Below are many of the common printers that are available on the market and the printer filters supplied with the Word Juggler software that support the various features of those printers. Some filters are designed with the specific printers in mind, while other filters are matched to the printer taking into consideration the features of the device.

PRINTER	FILTER	TYPE
QUME SPRINT 5	APPLE LQP/DIABLO/XEROX/QUME/NEC	STANDARD
QUME SPRINT 7	APPLE LQP/DIABLO/XEROX/QUME/NEC	STANDARD
QUME SPRINT 9	APPLE LQP/DIABLO/XEROX/QUME/NEC	STANDARD

Monochrome Monitor General Troubleshooting

Revised: 1/30/92
Security: Everyone

Monochrome Monitor General Troubleshooting

=====

This article last reviewed: 15 December 1987

USING THE SYMPTOM CHART

Find the symptom that best describes how the defective monitor appears and then try the recommended actions in the order listed. If the first corrective action does not solve the problem, put back the original module or part before trying the next action.

Symptom	Corrective Action
No power (LED doesn't light)	1. Check fuse; replace if blown. If it blows again, replace transformer. 2. Replace transformer. 3. Replace power switch.
No raster	1. Check that video cable is securely connected. 2. Adjust the external brightness control on the back of the case. 3. Adjust the contrast control. 4. Check that all connectors are secure on the CRT board and the main logic board. 5. Replace main logic board. 6. Replace CRT.
One vertical raster line appears	1. Replace main logic board. 2. Replace CRT assembly.
Raster deformed	Replace CRT assembly.

Wavy picture	Replace main logic board.
Spot remains with unit off	Replace main logic board.
Brightness range abnormal	1. Replace main logic board. 2. Replace power transformer.
Raster size small, picture abnormally bright	Replace main logic board.
No vertical synchronization	Replace main logic board.
Screen bright, no picture	Replace main logic board.
15 or more seconds for picture to appear	Change CRT assembly.
Picture appears and disappears	1. Replace main logic board. 2. Replace CRT assembly.
Out of focus	See "Focus" in Section 3, Adjustments*
Won't focus	1. Replace main logic board. 2. Replace CRT.
Narrow raster	Replace main logic board.
Picture compressed or stretched out	Replace main logic board.
Picture tears	See "Horizontal Synchronization" in Section 3, Adjustments*
Image reversed (after servicing)	Yoke connector (P4) is plugged in backwards.

Image inverted
(after servicing)

Yoke connector (P3) is plugged in backwards.

PROFS: Limits on Cut and Paste

Revised: 8/21/89
Security: Everyone

PROFS: Limits on Cut and Paste

=====

This article last reviewed: 7 January 1988

The message editor on PROFS accepts only two lines of text. Any additional text is automatically looped back to the top line of the screen. PROFS' Note editor allows up to 16 lines of text before looping to the top of the screen after the 16th carriage return.

The PROFS help message states that to type into further screens, an F10 (next page) or F4 (add line) key is required. This seems to mean that the user can paste only 16 lines of text at a time, followed by a next-page or add-line function key before continuing. There is a possible fix that includes modifying a font to show the character represented by a command-[. That character followed by a 0, if pasted every 16 lines, would do a next-page PF10.

JAZZ: Transferring JAZZ Word Processing Documents to MacWrite

Revised: 12/10/85
Security: Everyone

JAZZ: Transferring JAZZ Word Processing Documents to MacWrite

=====

JAZZ Word Processing Documents can be transferred to MacWrite. This can be very important if you are writing a long document and begin to run out of memory in JAZZ. To move a JAZZ Word Processing Document into MacWrite choose Save As from your File menu in JAZZ and click on Text Only and then Save. This will save your document as text only, which MacWrite will be able to read. Just transfer the text only file from your JAZZ startup disk to the MacWrite disk and you will be able to open it.

Note: When saving a document as text only you will lose formatting.

JAZZ: Doing a Query Sort by Date in the Database

Revised: 12/10/85
Security: Everyone

JAZZ: Doing a Query Sort by Date in the Database

=====

It is possible to do a query sort by date in the database. An example would be to find all students born between June 21,1985 and July 24,1985. To do this the following formula would be used in the Database Query-

```
>DATE(85,6,21)#AND#FIELDNAME<DATE(85,7,24)
```

Insert your own field name for FIELDNAME.

This formula can be used for invoice dates, sales dates, ect. Just make sure to put the dates in the same format in the query as in the Field Format for the field in the database.

JAZZ: Getting Rid of 0's in the Database Report

=====

If you would like to not print out 0's in your Database Report when the contents of a field is 0 a formula must be used.

=IF(ISBLANK(FIELD 1)," ",FIELD 1)

This formula should be used in the Record Detail line of your Show Definition on the Database Report. Insert your own field names for FIELD 1.

JAZZ: Frozen Margins in Word Processing

=====

When using JAZZ Word Processing you must turn off the Tab Wells after using them. After you click on a regular or decimal tab well, the tab well turns black, now you can click anywhere on the bottom half of the ruler to insert a tab. Just make sure to go back and click on the tab well to turn it white after you have finished or it will freeze your margins.

ImageWriter II: New Logic Boards

Revised: 1/30/92
Security: Everyone

ImageWriter II: New Logic Boards

=====

This article last reviewed: 20 November 1987

Problem:

After exchanging the the logic board in an ImageWriter II the error light comes on and the select light stays off. The printer does not respond to the computer or to a self test command.

Cure:

All of the logic boards being shipped as exchange modules are the new Revision A boards. The Revision A boards are compatible with both the old mechanical paper out sensor and the new optical paper out sensor. Switch 3 on the logic board must be configured properly for the type of paper out sensor used on the printer. Jumper pins 1 and 2 for the mechanical sensor and pins 2 and 3 for the optical sensor. Refer to the ImageWriter II Technical Procedures for more information.

Jazz Word Processing: Printing Pages After Page 7

Revised: 7/30/87
Security: Everyone

Jazz Word Processing: Printing Pages After Page 7

=====

It has been reported that there is sometimes a problem printing a range of pages after page 7 in JAZZ word processing (ex. Print pages 9-12). Sometimes when trying to print a range of pages it will start printing at the beginning of the file. A solution is to copy and paste the pages you want to print into a new Word Processing document and then print that document. Also, you can always choose Save As from your file menu and click on Text Only -- then MacWrite can read your file. This can also be helpful when a document gets too long for the JAZZ Word Processor.

Jazz: Formatting Columns & Rows in JAZZ (Running Out of Memory)

Revised: 7/30/87
Security: Everyone

Jazz: Formatting Columns & Rows in JAZZ (Running Out of Memory)

=====

Do not format Columns and Rows in JAZZ. JAZZ uses up some RAM memory for every cell you format, so if you format a Column with 8,192 cells you will rapidly run out of RAM memory. If you think you have formatted a column in the Worksheet, you should choose Select All from your Edit menu. Look in the cell Selection Box it will say (ex. A1..G56), but if it says (A1..G8192) you know you have formatted a column. The same problem will occur if you format rows- if the cell Selection Box says A1..IV52, you know you have formatted a Row. When you have formatted a Row or Column you should choose Disable Undo desk accessory and then click on the Column or Row heading and turn the Column or Row black. Now, choose Format from the Range menu and choose Default as the formatting choice.

Choose Select All from the Edit menu again to make sure your Worksheet is back down to the proper size.

Note: If you think you have formatted a Row or Column in a small Worksheet it is often quicker to click and drag over the part of the Worksheet you are using and then choose Copy from the Edit menu. Close the Worksheet you were working on and open a new one and then paste in the contents of the old one.

Hint: Check the About JAZZ desk accessory frequently while using JAZZ it will let you see how much RAM is still available. Also, save your Worksheets every 15 minutes so that if you get into a problem you will not lose too much work.

Jazz: Mailing Labels with Jazz on the Apple Imagewriter

Revised: 12/10/85
Security: Everyone

Jazz: Mailing Labels with Jazz on the Apple Imagewriter

=====

Here are some guidelines for the number of lines that can fit on a mailing label:

Small Label	12ptNY	4 lines
	10ptNY	5 lines
Corporate Label	12ptNY	12 lines
	10ptNY	16 lines

If the number of lines per label exceeds the guidelines, a double line appears indicating that the information cannot fit on one mailing label, but will fit on two. Once you have established an incorrect mailing label in a word processing document, you must reconstruct your correct mailing label in a new document. These directions are for use on the Imagewriter only, if you are using a LaserWriter you will not have the choice of mailing labels in your Page Set-up menu.

1. When printing mailing labels with Jazz, the ImageWriter prints a label, drops a few spaces and then reverses itself to print the next label. This action often catches the label and causes a paper jam. To avoid this, adjust the platen on the ImageWriter (pg. 21 ImageWriter Manual).
2. If you are printing many labels you can choose Draft from the Page Setup menu and the labels will not reverse itself when printing, thereby reducing the chance of jamming.
3. When "Hotviewing" the name and address in your word processing document make sure you don't hit the return key at the end of the last line or the cursor will move down a line and JAZZ might think you have too many lines of text. You will get one blank label between each good one if you have done this. To get rid of the blank label between each good one you must start again with a new Word Processing Document.
4. Many people forget the last step when doing mailing labels. The last step is to go back to your database on last time and select the records you would like to use to for labels. There are three ways to select records. The first is to

choose Select All from the Edit menu. The second is to use a query in the database to select certain records (example- people in a certain state). The third way to select records is by highlighting a few.

Jazz: JAZZ Cable Pin Settings to Connect Mac with PC's and VAX

=====

The following tables are pin outs if you would like to make your own cables to transfer files directly from your PC to the Mac at speeds of 4800 and 9600 Baud.

Mac to IBM (or other serial devices)

Mac	IBM
RS-442A	RS-232C
(9 Pin Male)	(25 Pin Female)
1-----	1
3-----	7
5-----	3
7-----	20
9-----	2

Mac to VAX or Modem (Hayes)

Mac	VAX or Modem
(9 Pin Male)	(25 Pin Male or Female)
1-----	1
2-----	20
3-----	7
5-----	2
7-----	5
9-----	3

You can make your own adapter cables from parts commonly available at Radio Shack or other electronic parts suppliers.

ImageWriter LQ General Troubleshooting (Part 1 of 3)

Revised: 1/30/92
Security: Everyone

ImageWriter LQ General Troubleshooting (Part 1 of 3)

=====

This article last reviewed: 20 November 1987

NOTE: Detailed instructions for Take-Apart can be found in the Technical Procedures.

INTRODUCTION

Before starting, read the section titled "Preliminary Checks". Items listed here do not require any disassembly, tools, or special setups and can save you time and your customer money when troubleshooting the ImageWriter LQ.

If the suggestions in "Preliminary Checks" do not correct the problem, proceed to the appropriate symptom/cure chart.

How to Use the Symptom/Cure Chart:

First locate the symptom that comes closest to the symptom describing the problem; then perform the first corrective action on the solution list. If that corrective action does not fix the problem, proceed to the next action. If you replace a module and find that the problem remains, reinstall the original module before proceeding.

If a step asks you to test something, the procedure can be located elsewhere in this section.

If a tested component is defective, replace it. If it is not defective, proceed to the next action listed.

PRELIMINARY CHECKS

The following chart lists common problems that have simple solutions. Checking for these problems when you begin troubleshooting can save you time and effort.

Power light off, no carrier movement
1. Try another electrical outlet.

2. International units only: Verify the setting of the voltage selector.
3. Replace the power cord.

Error light blinks

Close the front cover.

Error light on, Select light off

No paper is inserted or is improperly inserted.

No printing

1. Make sure the printer is selected.
2. Verify that the interface connections to the printer are secure.
3. Verify the DIP switch settings.

Garbled printing

1. Verify the DIP switch settings.
2. Verify that the interface connections to the printer are secure.

Software-specific problem

Try using a known-good piece of software.

No communication with option card installed

Verify that DIP switch 2 position 4 is set to ON.

Paper feed difficulties (binding, tearing, etc.)

1. Verify the setting of the paper thickness lever.
2. Check, and if necessary, clear the paper path.

Torn Paper

1. Verify the setting of the paper thickness lever.
2. Verify that the paper-feed lever is set to the type of paper being used.
3. Verify that the paper is correctly installed and, if using tractor feed paper, that the sprocket holes are properly engaged on the tractor sprockets.

Printing too light

1. Verify the setting of the paper thickness lever.
2. Replace the ribbon.

Printing too dark

Verify the setting of the paper thickness lever.

SYMPTOM/CURE CHART

Power Problems

Power light off and no carrier motion

1. Test the primary fuse. If defective, replace it.
2. Test the three secondary fuses. If any are defective, replace the defective one(s).
3. Test the power switch. If defective, replace it.
4. Replace the main board.
5. Replace the transformer.

6. Replace the noise filter PCA.

Communication Problems

No printing or garbled printing

Perform the printer self-test. If the self-test passes, run the diagnostics to test the main board. If the self-test fails, replace the main board.

Carrier Problems

Carrier moves at power on, but doesn't return to home position

1. Test the home position switch. If defective, replace it.
2. Perform the "Home Position Switch Adjustment".
3. Replace the main board.

Power light on, no carrier motion

1. Check, and if obstructed, clear the carrier area.
2. Test the carrier motor. If defective, replace it.
3. Replace the main board.

Paper Feed Problems

No paper feed

1. Check the paper feed gear train and clear it if it is obstructed.
2. Test the paper-handling change switch. If defective, replace it.
3. Test the paper feed motor. If defective, replace it.
4. Replace the main board.

Paper bail doesn't automatically open and close

1. Test the auto-load solenoid. If defective, replace it.
2. Replace the main board.

For more ImageWriter LQ troubleshooting information see the following articles:

ImageWriter LQ General Troubleshooting (Part 2 of 3)

ImageWriter LQ General Troubleshooting (Part 3 of 3)

Refer to the Technical Procedures for the take apart instructions.

Installing Aladin On Catalyst For The Apple III

Revised: 12/10/85
Security: Everyone

Installing Aladin On Catalyst For The Apple III

=====

You may move Aladin (Advanced Data Institute) version 2.6 to a hard disk for use with Catalyst.

If you are using a ProFile hard disk in slot 4 with a volume name of "/PROFILE", most of your work has been done for you by the folks at ADI. Simply follow the installation instructions entitled "APPLE III STARTUP PROCEDURE" on page S-10 - S-14 of the Aladin product manual. Once these steps have been completed, follow along below.

If you are using your Catalyst with a different brand of hard disk, You must add the device drivers of the hard disk you are using to the Aladin BOOT disk using the System Configuration Program of your System Utilities. After this has been done, then you may precede with the "APPLE III STARTUP PROCEDURE" in the Aladin manual and follow along below.

COPY PROCEDURE

In addition to the automatic installation provided to you by Aladin, three additional files must be copied to the hard disk to allow you to use Aladin without having to insert the BOOT disk at startup. In this example, the volume name of the hard disk is "/P". If your hard disk volume name is different, substitute it for "/P".

1. Boot the Catalyst disk (if you haven't already).
2. From the Catalyst main menu, select the System Utilities Program.
3. Enter "F" for FILE HANDLING COMMANDS.
4. Enter "C" for COPY FILES.
5. Copy the file "SYSTEM.STARTUP" from the Aladin BOOT disk to the subdirectory "/P/ALADIN".

To do this, type ".Dl/" and press the up arrow key. A list of files are displayed in a box. The up and down arrow keys allow you to move an inverse bar

over the name of your choice. Pressing the right arrow key marks the file so as to include it in the copy process. Mark all files to be copied in this way. When all files are marked, press RETURN.

6. Copy the files ALADIN3.INFO and ALADIN.CODE to "/P/=" using the procedure above.

7. When these files have been copied, press ESCAPE.

ADDING ALADIN TO THE CATALYST MENU

1. Return to the Catalyst main menu.
2. Select the Catalyst Editor in the Catalyst main menu.
3. Enter "E" to edit the menu.
4. Use the up and down arrow keys to position the inverse bar over the entry you want the program to precede. Press "A" to add a program entry.
5. You will be asked for the display name of this program, enter "ALADIN".
6. Enter "CATALYST/PASCAL" as the interpreter pathname.
7. You will be asked for a list of any extra drivers this program requires. Enter ".PRINTER"
8. Press RETURN for the character set pathname.
9. Press RETURN for standard character set.
10. Press RETURN again to use the default keyboard.
11. Press RETURN to accept the default prefix.
12. Enter "3" for the "Max Files Allowed...." question. This will allow the program to be exited by holding down both Apple keys and pressing ESCAPE. (The value 3 suppresses the DISK FILES OPEN warning).
13. Enter "ALADIN/SYSTEM.STARTUP" when you are asked for the program path.
14. You will be asked if this entry is correct. If it is, enter "Y" then press ESCAPE to exit to the main menu.

If you made any mistakes during entry, enter "N". You may then enter the number of the item you wish to correct. When all items are correct, press ESCAPE. Then press ESCAPE again to exit to the main menu.

15. Enter "5" to update the INTERPS file. When you are asked if you want to recalculate the load address, enter "N".

16. Exit to the CATALYST main menu by entering "Q".

Installing Apple Speller On Catalyst For The Apple III

Revised: 12/10/85
Security: Everyone

Installing Apple Speller On Catalyst For The Apple III

=====

You may move Apple Speller III to the hard disk for use with Catalyst. These instructions assume you are moving Apple Speller III to a ProFile (with a driver name .PROFILE). Substitute the name of your hard disk driver for .PROFILE if you wish to install Apple Speller III to a different hard disk.

COPY PROCEDURE:

1. Boot the Catalyst diskette.
2. From the Catalyst main menu select the System Utilities Program.
3. Enter "F" for File Handling Commands.
4. Enter "M" for Make a New Subdirectory.
5. Enter "CATALYST/SPELL".
6. Enter "25" as the subdirectory size.
7. In the same manner, create the subdirectory: "DICTIONARY" with room for 25 files.
8. Press "ESCAPE".
9. Enter "C" for copy files.
10. Copy all files on the Apple Speller III PROGRAM disk to the subdirectory "CATALYST/SPELL" except for the following:

SYSTEM.MISCINFO SYSTEM.PASCAL SOS.KERNEL SOS.INTERP and SOS.DRIVER

To do this, type ".D1/" and press the up arrow key. A list of files is displayed in a box. The up and down arrow keys allow you to move an inverse bar over the name of your choice. Pressing the right arrow key marks the file so as to include it in the copy process. Mark all files to be copied in this way. When all files are marked press RETURN.

11. Enter "R" to rename a file.
12. Change the name of "SYSTEM.LIBRARY" to "SYSTEM.STAR.LIB" and "SYSTEM.STARTUP" to "START.CODE".
13. After all files have been copied and renamed, copy ALL files from disks DICTIONARY 1 and DICTIONARY 2 to the subdirectory "DICTIONARY".

ADDING APPLE SPELLER III TO THE CATALYST MENU

1. Return to the Catalyst main menu.
2. Select the Catalyst Editor in the Catalyst main menu.
3. Enter "E" to edit the menu.
4. Use the up and down arrow keys to position the inverse bar over the entry you want the program to precede. Press "A" to add a program entry.
5. You will be asked for the display name of this program, enter "APPLE SPELLER".
6. Enter "CATALYST/PASCAL" as the interpreter pathname.
7. You will be asked for a list of any extra drivers this program requires. Press RETURN.
8. Press RETURN for the character set pathname.
9. Press RETURN for standard character set.
10. Press RETURN again to use the default keyboard.
11. Press RETURN to accept the default prefix.
12. Enter "3" for the "Max Files Allowed...." question. This will allow the program to be exited by holding down both Apple keys and pressing ESCAPE. (The value 3 suppresses the DISK FILES OPEN warning).
13. Enter "CATALYST/SPELL/START.CODE" when you are asked for the program path.
14. You will be asked if this entry is correct. If it is, enter "Y" then press ESCAPE to exit to the main menu.
If you made any mistakes during entry, enter "N". You may then enter the number of the item you wish to correct. When all items are correct, press ESCAPE. Then press ESCAPE again to exit to the main menu.
15. Enter "5" to update the INTERPS file. When you are asked if you want to recalculate the load address, enter "N".
16. Exit to the CATALYST main menu by entering "Q".

Installing Appleworks 1.2 On Catalyst 2.1

Revised: 12/10/85
Security: Everyone

Installing Appleworks 1.2 On Catalyst 2.1

=====

With the release of Appleworks 1.2, some changes in the installation procedure must be made. These instructions also assume that you have installed Catalyst properly and that you have a hard disk with the volume name of "/PROFILE". To install the new version, follow along below.

1. Boot the Catalyst disk (if you haven't already).
 2. From the Catalyst main menu, select the Filer.
 3. Press "F" for File Commands.
 4. Press "L" for List ProDOS Directory.
 5. Place the Appleworks BOOT disk in drive 1.
 6. Enter "/APPLEWORKS".
 7. A listing of all the files on the Appleworks disk will appear. Check for the filename "QUARK.INSTALL". If the file exists, continue with the next step. If the file DOES NOT exist, go to step 13.
 8. Press the ESCAPE KEY two times. Press "Q". This should place you in the Catalyst main menu.
 9. From the main Catalyst menu, select the Catalyst Editor.
 10. Select option 6.
 11. Select option 5 to install "Miscellaneous Manufacturers" programs. Follow the directions on the screen. Appleworks will be installed automatically for you.
 12. When the process is completed, you will be returned to the Catalyst Editor.
- Select option 7 to quit.
13. Press the RETURN key. Press the ESCAPE key.
 14. Press "M" for Make a New Subdirectory.
 15. Enter "/PROFILE/AW".
 16. Press ESCAPE.
 17. Place the Appleworks BOOT disk in drive 1.
 18. Press "C" to Copy Files.
 19. For Source Pathname enter "/APPLEWORKS/=" and press RETURN.
 20. For Destination Pathname enter "/PROFILE/AW/="
 21. Hit "RETURN" when you are prompted to do so.
 22. Place the Appleworks PROGRAM disk in drive 1.
 23. For the Source Pathname enter "/APPLEWORKS/=" and press RETURN.

..TIL01554-Installing_Appleworks_1-2_On_Catalyst_2-1.pdf

24. For the Destination Pathname Enter "/PROFILE/AW/=" and press RETURN.
25. Press Return when you are prompted to do so.
26. Press Escape two times. Press "Q".

ADDING APPLEWORKS 1.2 TO THE CATALYST MAIN MENU

1. Boot the Catalyst disk.
2. Select the Catalyst Editor.
3. Enter 1 to Edit the Catalyst Menu.
4. Place the cursor to the position that you want the Appleworks menu entry to occur.
5. Press "A". You will be asked for the display name of this program. Enter "Appleworks".
6. For the Interpreter Pathname enter "/PROFILE/AW/APLWORKS.SYSTEM".
7. For the Prefix enter "/PROFILE/AW"
8. Press RETURN for Program Pathname.
9. You will be asked if this entry is correct. If it is answer "Y".
10. Press the ESCAPE key.
11. Enter "5" to update the Interpreter file.
12. Exit to the Catalyst main menu.

Installing Backup III on Catalyst For The Apple III

Revised: 12/10/85
Security: Everyone

Installing Backup III on Catalyst For The Apple III

=====

You may move BACKUP III (Apple) to the hard disk. This will allow you to access it with greater ease than using floppy disks.

COPY PROCEDURE

- 1) Boot the CATALYST diskette (if you haven't already).
- 2) From the main CATALYST menu, select the Systems Utilities Program.
- 3) Press "F" for File Handling Commands.
- 4) Press "M" for Make a New Subdirectory.
- 5) Enter ".PROFILE/CATALYST/BU3".
- 6) Press RETURN to accept the default size of 25 files.
- 7) Press ESCAPE.
- 8) Put the BACKUP III PROGRAM diskette in the internal drive.
- 9) Press "C" to copy files.
- 10) Copy SYSTEM.STARTUP from the BACKUP III PROGRAM disk to ".PROFILE/CATALYST/BU3/SYSTEM.STARTUP".
- 11) Press ESCAPE.

ADDING BACKUP III TO THE CATALYST MENU

- 1) Enter the number for CATALYST EDIT.
- 2) Enter "1" to add an entry to the menu.
- 3) Enter the number of the menu entry you want BACKUP III to precede.
- 4) You will be asked for the display name of this program. Enter BACKUP III.
- 5) Enter "CATALYST/PASCAL" for the interpreter pathname.
- 6) Press RETURN for the character set pathname.
- 7) Press RETURN for standard character set.
- 8) Press RETURN again to use the default keyboard.
- 9) Press RETURN to accept the default prefix.
- 10) Enter "3" for the "Max Files Allowed..." question.
- 11) Enter ".PROFILE/CATALYST/BU3,SYSTEM.STARTUP" when you are asked for the program path.
- 12) You will be asked if this entry is correct. If it is, enter "Y", or just press RETURN. You will be allowed to insert another entry. Since you do not

..TIL01555-Installing_Backup_III_on_Catalyst_For_The_Apple_III_(TA31862).pdf

want to do this, enter "0" to exit to the main menu.

13) Enter "7" to update the INTERPS file. When you are asked if you want to recalculate the load address, enter "N".

14) Exit to the CATALYST main menu by entering "0".

Installing Apple Business Graphics on an Apple III

Revised: 12/10/85
Security: Everyone

Installing Apple Business Graphics on an Apple III

=====

You may move APPLE BUSINESS GRAPHICS to the hard disk. This will allow you to access it with greater ease than by using a floppy. However, because of the particular copy protection scheme used for APPLE BUSINESS GRAPHICS, you will have to install the APPLE BUSINESS GRAPHICS diskette in the internal drive before using it.

The .GRAFIX driver must be installed on your CATALYST disk. Additionally, 16K of graphics space must be allocated in Pascal. If you get the message "INSUFFICIENT GRAPHICS SPACE ALLOCATED" when trying to invoke BUSINESS GRAPHICS, you may allocate graphics space by pressing "O" from the Pascal command line. Then press "A", then "C", then "Q". Pascal will be restarted. Enter "0" to return to CATALYST. You may then re-enter BUSINESS GRAPHICS successfully.

NOTE:

In order for BUSINESS GRAPHICS to work with CATALYST, the file SYSTEM.LIBRARY that is located on the BUSINESS GRAPHICS MASTER disk MUST be installed on the root directory of your profile. If you already have the Apple Pascal language installed in conjunction with CATALYST, this procedure will not be necessary.

COPY PROCEDURE:

- 1) Boot the CATALYST diskette.
- 2) From the main CATALYST menu, select the Systems Utilities Program.
- 3) Press "F" for File Handling Commands.
- 4) Press "M" for Make a New Subdirectory.
- 5) Enter .PROFILE/CATALYST/BG.
- 6) Press RETURN to accept the default size of 25.
- 7) Press ESCAPE.
- 8) Put the APPLE BUSINESS GRAPHICS MASTER diskette in the internal drive.
- 9) Press "C" for Copy Files.
- 10) Copy all files from your APPLE BUSINESS GRAPHICS MASTER diskette except for the following:
 - SYSTEM.PLOT
 - SYSTEM.MISCINFO
 - SYSTEM.PASCAL

SYSTEM.LIBRARY

- 11) To do this, type ".D1/" and press the up arrow key.
- 12) A list of files is displayed in a box. The up and down arrow keys allow you to move an inverse bar over the name of your choice. Pressing the right arrow key marks the file so as to include it in the copy process. Mark all files to be copied in this way. When all files are marked press RETURN.
- 13) Enter ".PROFILE/CATALYST/BG/=" for the name of the destination file.
- 14) Copy the SYSTEM.LIBRARY from the APPLE BUSINESS GRAPHICS MASTER diskette.
- 15) Enter ".PROFILE/CATALYST/BG/PLOT.LIB" as the destination file.
- 16) When the copy is complete, insert the BUSINESS GRAPHICS DATA disk in the built in drive.
- 17) Enter ".D1/=H.TEXT" as the source file name.
- 18) Enter ".PROFILE/CATALYST/BG/=H.TEXT" as the destination file name.

If you have the Apple Pascal language installed on your ProFile in conjunction with CATALYST, skip to step 21.

- 19) Make a second copy of the file SYSTEM.LIBRARY.
 - 20) Enter ".PROFILE/SYSTEM.LIBRARY" as the destination file name.
 - 21) When all files have been copied press ESCAPE.
- ADDING APPLE BUSINESS GRAPHICS TO THE CATALYST MENU

- 1) Enter the number for CATALYST EDIT.
- 2) Enter "1" to add an entry to the menu.
- 3) Enter the number of the menu entry you want BUSINESS GRAPHICS to precede.
- 4) You will be asked for the display name of this program. Enter BUS. GRAFIX.
- 5) Enter CATALYST/PASCAL for the interpreter pathname.
- 6) Press RETURN for the character set pathname.
- 7) Press RETURN for standard character set.
- 8) Press RETURN again to use the default keyboard.
- 9) Press RETURN to accept the default prefix.
- 10) Enter "3" for the "Max Files Allowed..." question.
- 11) Enter "/*.PROFILE/CATALYST/BG,SYSTEM.STARTUP" when you are asked for the program path. This will generate a bad path error but ignore it.
- 12) You will be asked if this entry is correct. If it is answer "Y". You will be allowed to insert another entry. Since you do not want to do this, enter "0" to exit to the main menu.
- 13) Enter "7" to update the INTERPRETER file. When you are asked if you want to recalculate the load address, enter "N".
- 14) Exit to the CATALYST main menu by entering "0".

In order to access the HELP files you transferred to your ProFile you must set the default prefix within BUSINESS GRAPHICS by doing the following.

- 1) Boot BUSINESS GRAPHICS.
 - 2) From the main menu type: "SET DEFAULT VOL .PROFILE/CATALYST/BG" and press return.
- Now BUSINESS GRAPHICS will use that subdirectory as a source for your work files and for its program and help files.

Installing Datafax On Catalyst For The Apple III

Revised: 12/10/85
Security: Everyone

Installing Datafax On Catalyst For The Apple III

=====

You may move DataFax (Link Systems) to a hard disk for use with Catalyst. These instructions assume you are moving DataFax to a ProFile (with driver name .PROFILE). Substitute the name of your hard disk driver for .PROFILE if you wish to install DataFax on a different hard disk.

COPY PROCEDURE:

1. Boot the Catalyst diskette (if you haven't already).
2. From the Catalyst main menu, select the System Utilities Program.
3. Enter "F" for FILE HANDLING COMMANDS.
4. Enter "M" for MAKE A NEW SUBDIRECTORY.
5. Enter "CATALYST/DATAFAX" with a default size of 25 files.
6. Press "ESCAPE".
7. Enter "C" for COPY FILES.
8. Copy all files from the PROGRAM disk to the subdirectory "CATALYST/DATAFAX/=" except for the following:

SYSTEM.MISCINFO SYSTEM.PASCAL

To do this, type ".D1/" and press the up arrow key. A list of files are displayed in a box. The up and down arrow keys allow you to move an inverse bar over the name of your choice. Pressing the right arrow key marks the file so as to include it in the copy process. Mark all files to be copied in this way. When all files are marked, press RETURN.

9. When all files have been copied, press ESCAPE.

ADDING DATAFAX TO THE CATALYST MENU

1. Return to the Catalyst main menu.
2. Select the Catalyst Editor.
3. Enter "E" to edit the menu.

4. Use the up and down arrow keys to position the inverse bar over the entry you want the program to precede. Press "A" to ADD a program entry.
5. You will be asked for the display name of this program, enter "DATAFAX".
6. Enter "CATALYST/PASCAL" as the interpreter path name.
7. You will be asked if you want "EXTRA DRIVERS". See page 3-9 of the Catalyst manual for input instructions.
8. Press RETURN for standard character set.
9. Press RETURN for the normal screen.
10. Press RETURN for the default keyboard.
11. Press RETURN for initial prefix.
12. Enter "3" for the "Max Files Allowed..." question.
13. Enter "CATALYST/DATAFAX/SYSTEM.STARTUP" program path.
14. You will be asked if this entry is correct. If it is, enter "Y" then press ESCAPE to exit to the main edit menu. If you made any mistakes during entry, enter "N". You may then enter the number of the item you wish to correct. When all items are correct, press ESCAPE. Press ESCAPE again to exit to the main edit menu.
15. Enter "5" to update the INTERPS file. When you are asked if you want to recalculate the load address, enter "Y".
16. Exit to the Catalyst main menu by entering "Q".

Installing Desktop Plan on Catalyst for the Apple III (9/95)

Revised: 9/21/95
Security: Everyone

Installing Desktop Plan on Catalyst for the Apple III (9/95)

Article Created: 10 December 1985
Article Reviewed/Updated: 21 September 1995

TOPIC -----

This article contains a setup file from Visiscorp on how to use their product, Desktop Plan, on a hard drive equipped Apple /// computer.

DISCUSSION -----

You may move DESKTOP PLAN (VISICORP) to the hard disk. This will allow you to access it with greater ease than using the floppy diskettes.

COPY PROCEDURE:

1. Boot the CATALYST diskette.
2. From the main CATALYST menu, select the Systems Utilities Program.
3. Press "F" for File Handling Commands.
4. Press "M" for Make a New Subdirectory.
5. Enter ".PROFILE/CATALYST/PLAN".
6. Press RETURN to accept the default size of 25.
7. Press ESCAPE.
8. Put the DESKTOP PLAN PROGRAM diskette in the internal drive.
9. Press "C" for Copy Files.
10. Copy all the files from this diskette to ".PROFILE/CATALYST/PLAN".
11. After all the files have been copied from the PROGRAM diskette, put the DESKTOP PLAN SYSTEM diskette in the internal drive.
12. Copy all the files from this diskette EXCEPT for the following:
SOS.KERNEL SOS.DRIVER SOS.INTERP to ".PROFILE/CATALYST/PLAN".
13. To do this, type ".D1" and press the up arrow key. A list of files are displayed in a box. The up and down arrow keys allow you to move an inverse bar over the name of your choice. Pressing the right arrow key marks the file so as to include it in the copy process. Mark all files to be copied in this way. When all files are marked press RETURN.
14. When all files have been copied press ESCAPE.

ADDING DESKTOP PLAN TO THE CATALYST MENU

1. Return to the Catalyst main menu.
2. Select the Catalyst Editor.
3. Enter "E" to edit the menu.
4. Use the up and down arrow keys to position the inverse bar over the entry you want the program to precede. Press "A" to ADD a program entry.
5. You will be asked for the display name of this program, enter "DESK TOP PLAN"
6. Enter "CATALYST/BASIC as the interpreter path name.
7. You will be asked if you want "EXTRA DRIVERS", press RETURN.
8. Press RETURN for standard character set.
9. Press RETURN for the normal screen.
10. Press RETURN for the default keyboard.
11. Enter ".PROFILE/CATALYST as the initial prefix.
12. Enter "3" for the "Max Files Allowed..." question.
13. Enter ".PROFILE/CATALYST/PLAN.HELLO" for the program path.
14. You will be asked if this entry is correct. If it is, enter "Y" then press ESCAPE to exit to the main edit menu. If you made any mistakes during entry, enter "N". You may then enter the number of the item you wish to correct. When all items are correct, press ESCAPE. Press ESCAPE again to exit to the main edit menu.
15. Enter "5" to update the INTERPS file. When you are asked if you want to recalculate the load address, enter "N".
16. Exit to the Catalyst main menu by entering "Q".

ADDITIONAL INSTRUCTIONS:

The following instructions are for a ProFile named ".PROFILE". If your hard disk is named something else you will have to alter the instructions accordingly.

1. Select DESKTOP PLAN from the CATALYST menu.
2. Change the PROGRAM VOLUME NAME to: "PROFILE/CATALYST/PLAN". This will tell DESKTOP PLAN to look for all of its files under that volume name.
3. Once the volume name has been changed press RETURN.
4. Enter today's date and press RETURN.
5. Perform step #6 on page A-10 of the DESKTOP PLAN manual changing the "VOLUME NAME- PROGRAMS" from "PLAN" to "PROFILE/CATALYST/PLAN".
6. Perform step #7 on page A-10 of the DESKTOP PLAN manual.

You will now be able to access all files from your ProFile.

Installing Graph 'N' Calc On Catalyst For The Apple III

Revised: 12/10/85
Security: Everyone

Installing Graph 'N' Calc On Catalyst For The Apple III

=====

You may move Graph 'n Calc (Desk Top Computer Software Inc.) to the hard disk. This will allow you to access it with greater ease than using floppy disks. These instructions assume you are moving Graph 'n' Calc to a ProFile (with a driver name .PROFILE). Substitute the name of your hard disk driver for ".PROFILE" if you wish to install Graph 'n' Calc on a different hard disk.

COPY PROCEDURE

1. Boot the CATALYST diskette (if you haven't already).
2. From the main CATALYST menu, select the Systems Utilities Program.
3. Press "F" for File Handling Commands.
4. Press "M" for Make a New Subdirectory.
5. Enter ".PROFILE/GNC".
6. Press RETURN to accept the default size of 25 files.
7. Press ESCAPE.
8. Put the Graph'n' Calc "GNC1" diskette in the internal drive.
9. Press "C" to copy files.
10. Copy all files from your "GNC1" disk to ".PROFILE/GNC/=" except for the following:

SOS.KERNEL SOS.INTERP SOS.DRIVER

To do this, type ".D1" and press the up arrow key. A list of files are displayed in a box. The up and down arrow keys allow you to move an inverse bar over the name of your choice. Pressing the right arrow key marks the file so as to include it in the copy process. Mark all files to be copied in this way. When all files are marked, press RETURN.

11. Copy all files from "GNC2" to the same subdirectory using the procedure above.
12. When all files have been copied, Press ESCAPE.

ADDING GRAPH 'N' CALC TO THE CATALYST MENU

1. Return to the Catalyst main menu.

2. Select the Catalyst Editor.
3. Enter "E" to edit the menu.
4. Use the up and down arrow keys to position the inverse bar over the entry you want the program to precede. Press "A" to ADD a program entry.
5. You will be asked for the display name of this program, enter "GNC".
6. Enter "CATALYST/BASIC as the interpreter path name.
7. You will be asked if you want "EXTRA DRIVERS", enter ".GRAFIX"
8. Press RETURN for standard character set.
9. Press RETURN for the normal screen.
10. Press RETURN for the default keyboard.
11. Enter ".PROFILE/GNC" initial prefix.
12. Enter "0" for the "Max Files Allowed..." question.
13. Enter ".PROFILE/GNC/HELLO for the program path.
14. You will be asked if this entry is correct. If it is, enter "Y" then press ESCAPE to exit to the main edit menu. If you made any mistakes during entry, enter "N". You may then enter the number of the item you wish to correct. When all items are correct, press ESCAPE. Press ESCAPE again to exit to the main edit menu.
15. Enter "5" to update the INTERPS file. When you are asked if you want to recalculate the load address, enter "N".
16. Exit to the Catalyst main menu by entering "Q".

Installing Lazarus III On Catalyst For The Apple III

Revised: 12/10/85
Security: Everyone

Installing Lazarus III On Catalyst For The Apple III

=====

You may move Lazarus III to the hard disk. This will allow you to access it with greater ease than using floppy disks. These instructions assume you are moving Lazarus III to a ProFile (with a driver name .PROFILE). Substitute the name of your hard disk driver for .PROFILE if you wish to install Lazarus on a different hard disk.

NOTE: Lazarus III uses quite a bit of computer memory. Due to this a "STACK OVERFLOW" error may occur when invoking it from Catalyst. To avoid this condition, make the Apple II disk routines in the Pascal NOT resident by selecting "OPTIONS" from the Pascal Command Line.

COPY PROCEDURE

1. Boot the CATALYST diskette (if you haven't already).
2. From the main CATALYST menu, select the Systems Utilities Program.
3. Press "F" for File Handling Commands.
4. Press "M" for Make a New Subdirectory.
5. Enter ".PROFILE/CATALYST/LAZARUS".
7. Press ESCAPE.
8. Put the LAZARUS PROGRAM diskette in the internal drive.
9. Press "C" to copy files.
10. Copy only the SYSTEM.STARTUP file from your PROGRAM disk to ".PROFILE/CATALYST/LAZARUS/SYSTEM.STARTUP"
11. When this file has been copied, Press ESCAPE.

ADDING LAZARUS III TO THE CATALYST MENU

1. Return to the Catalyst main menu.
2. Select the Catalyst Editor.
3. Enter "E" to edit the menu.
4. Use the up and down arrow keys to position the inverse bar over the entry you want the program to precede. Press "A" to ADD a program entry.
5. You will be asked for the display name of this program, enter "LAZARUS III".
6. Enter "CATALYST/PASCAL" as the interpreter path name.

7. You will be asked if you want "EXTRA DRIVERS". Press RETURN.
8. Press RETURN for standard character set.
9. Press RETURN for the normal screen.
10. Press RETURN for the default keyboard.
11. Press RETURN for the initial prefix.
12. Enter "3" for the "Max Files Allowed..." question.
13. Enter ".PROFILE/CATALYST/LAZARUS/SYSTEM.STARTUP" for the program path.
14. You will be asked if this entry is correct. If it is, enter "Y" then press ESCAPE to exit to the main edit menu. If you made any mistakes during entry, enter "N". You may then enter the number of the item you wish to correct. When all items are correct, press ESCAPE. Press ESCAPE again to exit to the main edit menu.
15. Enter "5" to update the INTERPS file. When you are asked if you want to recalculate the load address, enter "N".
16. Exit to the Catalyst main menu by entering "Q".

Manual Installation Of Programs On Catalyst 3.0 (9/95)

Revised: 9/21/95
Security: Everyone

Manual Installation Of Programs On Catalyst 3.0 (9/95)

Article Created: 10 December 1985
Article Reviewed/Updated: 21 September 1995

TOPIC -----

This article describes the process for installing software to be used with an Apple /// computer running VisiCorp's product, Catalyst 3.0.

DISCUSSION -----

With the release of Catalyst 3.0 some programs will need to be manually installed, until the manufacturer of the program has a Catalyst Desktop file for their program.

1. Boot the Catalyst disk (if you haven't already).
2. Open the floppy disk icon and select the System Utilities program.
3. Press "7" for Identify and Catalog a Disk.
4. Place the BOOT disk for the Program in drive 1.
5. Select Slot 6 Drive 1 and press Return.
6. Press RETURN to list file to the display.
7. A listing of all the files on the BOOT Disk disk will appear. Check for the filename "Catalyst.Desktop". If the file exists, follow the procedure for coping a program as discribed in the Catalyst manual.
8. Check for a file whose name ends in ".system". If the file is "BASIC.SYSTEM" Follow the Proceedure in the Catalyst Manual for installing BASIC Programs.
9. Write down the name of the System file _____.
10. Press the ESCAPE key.
11. Insert the disk you want to want install the program on. If the disk you want copy the program to is a hard disk, make sure that System Utilities can access it.
12. Select Option 8 for Advanced Operations.
13. Select Option 2 to Create Directory.
14. For Path Name enter the "/" name of disk "/" name of the directory.
EXAMPLE ("/PROFILE/AW" is the directory we use use for AppleWorks).
15. Press the ESCAPE key twice.

16. Select option 1 to Copy Files.
17. For Source use Slot 6 Drive 1.
18. For Destination use the Directory Path Created in Step 14.
19. Copy all Files.
20. If there is a second disk copy the files from the disk using steps 16-19.
21. Select option 2 to Delete a File.
22. For Path Name enter the Directory Path in step 14 plus "/PRODOS".
23. Select option 9 to exit.

ADDING THE PROGRAM TO THE CATALYST DESKTOP.

1. Boot the Catalyst disk.
2. Insert the disk installing program to. If you are using a hard disk check to see that an icon for the hard disk displayed on the Desk Top. If the hard disk is not available restart the system using the procedure specified by the hard disk manufacture.
3. Select ADD A PROGRAM FROM THE MISCELLANEOUS menu. NOTE IF DURING THE ADD A PROGRAM PROCEDURE YOU PRESS THE RETURN KEY YOU WILL EXIT ADD A PROGRAM. TO FINISH ENTERING THE PROGRAM INFORMATION SELECT GET INFO FROM THE FILE MENU.
4. For Program Title enter the name of the program and press the TAB key.
5. For System File enter the name of the System file Specified in step 9 above and press the TAB key.
6. For Prefix enter the name of the Directory created in step 14 above and press the TAB key.
7. For Program Path press the TAB key.
8. If everything is correct Click on the OK box.

Installing Microcourier On Catalyst For The Apple III

Revised: 12/10/85
Security: Everyone

Installing Microcourier On Catalyst For The Apple III

=====

You may move MicroCourier to a hard disk for use with Catalyst. These instructions assume you are moving MicroCourier to a ProFile (with driver name .PROFILE). Substitute the name of your hard disk driver for .PROFILE if you wish to install MicroCourier on a different hard disk.

COPY PROCEDURE:

2. From the Catalyst main menu, select the System Utilities Program.
3. Enter "F" for FILE HANDLING COMMANDS.
4. Enter "M" for MAKE A NEW SUBDIRECTORY.
5. Enter "CATALYST/COURIER" with a default size of 25 files.
6. Press "ESCAPE".
7. Enter "C" for COPY FILES.
8. Copy all files from the PROGRAM disk to the subdirectory "CATALYST/COURIER/="

To do this, type ".D1/" and press the up arrow key. A list of files are displayed in a box. The up and down arrow keys allow you to move an inverse bar over the name of your choice. Pressing the right arrow key marks the file so as to include it in the copy process. Mark all files to be copied in this way. When all files are marked, press RETURN.

9. When all files have been copied, press ESCAPE.

ADDING MICROCOURIER TO THE CATALYST MENU

1. Return to the Catalyst main menu.
2. Select the Catalyst Editor.
3. Enter "E" to edit the menu.
4. Use the up and down arrow keys to position the inverse bar over the entry you want the program to precede. Press "A" to ADD a program entry.
5. You will be asked for the display name of this program, enter "MICROCOURIER"
6. Enter "CATALYST/PASCAL" as the interpreter path name.

7. You will be asked if you want "EXTRA DRIVERS". Enter ".RS232".
8. Press RETURN for standard character set.
9. Press RETURN for the normal screen.
10. Press RETURN for the default keyboard.
11. Press RETURN for initial prefix.
12. Press RETURN for the "Max Files Allowed open ..." question. This will allow the program to be exited only by the QUIT option in Microcourier. This procedure is suggested due to the fact that files and /or data may be lost if the double Apple escape option is used.
13. Enter "CATALYST/COURIER/SYSTEM.STARTUP" for the program path.
14. You will be asked if this entry is correct. If it is, enter "Y" then press ESCAPE to exit to the main edit menu. If you made any mistakes during entry, enter "N". You may then enter the number of the item you wish to correct. When all items are correct, press ESCAPE. Press ESCAPE again to exit to the main edit menu.
15. Enter "5" to update the INTERPS file. When you are asked if you want to recalculate the load address, enter "N".
16. Exit to the Catalyst main menu by entering "Q".

Installing Quickfile on Catalyst For The Apple III

Revised: 12/10/85
Security: Everyone

Installing Quickfile on Catalyst For The Apple III

=====

You may move QUICKFILE (APPLE) to the hard disk. This will allow you to access it with greater ease than by using a floppy.

COPY PROCEDURE:

- 1) Boot the CATALYST diskette.
- 2) From the main CATALYST menu, select the Systems Utilities Program.
- 3) Press "F" for File Handling Commands.
- 4) Press "M" for Make a New Subdirectory.
- 5) Enter ".PROFILE/CATALYST/QF".
- 6) Press RETURN to accept the default size of 25 files.
- 7) Press ESCAPE.
- 8) Put the QUICKFILE PROGRAM diskette in the internal drive.
- 9) Press "C" for Copy Files.
- 10) Enter ".D1/SYSTEM.STARTUP" as the source file name.
- 11) Enter ".PROFILE/CATALYST/QF/QF" as the destination file name.
- 12) Enter ".D1/SYSTEM.LIBRARY" as the next source file name to copy.
- 13) Enter ".PROFILE/CATALYST/QF/QF.LIB" as the name of the destination file.
- 14) When these files have been copied, hold down both APPLE keys and press ESCAPE to return to the CATALYST menu.

ADDING QUICKFILE TO THE CATALYST MENU

- 1) Enter the number for Catalyst Edit.
- 2) Enter "1" to add an entry to the menu.
- 3) Enter the number of the menu entry you want QUICKFILE to precede.
- 4) Enter QUICKFILE as the display name.
- 5) Enter CATALYST/PASCAL as the interpreter pathname.
- 6) Press RETURN for the character set pathname.
- 7) Press RETURN for standard character set.
- 8) Press RETURN again to use the default keyboard.
- 9) Press RETURN to accept the default prefix.
- 10) Enter "3" for the "max files allowed..." question.
- 11) Enter "CATALYST/QF,QF" when you are asked for the program path. (This will give a bad path error but ignore it.)
- 12) You will be asked if this entry is correct. If it is, enter "Y", or just press RETURN. You will be allowed to insert another entry. Since you do not

want to do this, enter "0" to exit to the main menu.

13) Enter "7" to update the INTERPS file. When you are asked if you want to recalculate the load address, enter "N".

14) Exit to the CATALYST main menu by entering "0".

Installing Thinktank On Catalyst For The Apple III

Revised: 12/10/85
Security: Everyone

Installing Thinktank On Catalyst For The Apple III

=====

You may move ThinkTank (Living Videotext) to the hard disk. This will allow you to access it with greater ease than using floppy disks. These instructions assume you are moving ThinkTank to a ProFile (with a driver name .PROFILE). Substitute the name of your hard disk driver for .PROFILE if you wish to install ThinkTank on a different hard disk.

COPY PROCEDURE

1. Boot the CATALYST diskette (if you haven't already).
2. From the main CATALYST menu, select the Systems Utilities Program.
3. Press "F" for File Handling Commands.
4. Press "M" for Make a New Subdirectory.
5. Enter ".PROFILE/CATALYST/THINKTANK"
6. Press RETURN to accept the default size of 25 files.
7. Press ESCAPE.
8. Put the THINKTANK PROGRAM diskette in the internal drive.
9. Press "C" to copy files.
10. Copy all files from your PROGRAM disk to ".PROFILE/CATALYST/THINKTANK/=" except for the following:

SYSTEM.STARTUP SYSTEM.MISCINFO SYSTEM.PASCAL

To do this, type ".D1" and press the up arrow key. A list of files are displayed in a box. The up and down arrow keys allow you to move an inverse bar over the name of your choice. Pressing the right arrow key marks the file so as to include it in the copy process. Mark all files to be copied in this way. When all files are marked, press RETURN.

11. When all files have been copied, Press ESCAPE.

ADDING THINKTANK TO THE CATALYST MENU

1. Return to the Catalyst main menu.
2. Select the Catalyst Editor.
3. Enter "E" to edit the menu.
4. Use the up and down arrow keys to position the inverse bar over the entry

you want the program to precede. Press "A" to ADD a program entry.

5. You will be asked for the display name of this program, enter "THINKTANK".
6. Enter "CATALYST/PASCAL" as the interpreter path name.
7. You will be asked if you want "EXTRA DRIVERS". Press RETURN.
8. Press RETURN for standard character set.
9. Press RETURN for the normal screen.
10. Press RETURN for the default keyboard.
11. Press RETURN for the initial prefix.
12. Enter "3" for the "Max Files Allowed..." question.
13. Enter ".PROFILE/CATALYST/THINKTANK,TANK.CODE" for the program path.
14. You will be asked if this entry is correct. If it is, enter "Y" then press ESCAPE to exit to the main edit menu. If you made any mistakes during entry, enter "N". You may then enter the number of the item you wish to correct. When all items are correct, press ESCAPE. Press ESCAPE again to exit to the main edit menu.
15. Enter "5" to update the INTERPS file. When you are asked if you want to recalculate the load address, enter "N".
16. Exit to the Catalyst main menu by entering "Q".

Installing Versaform On Catalyst For The Apple III

Revised: 12/10/85
Security: Everyone

Installing Versaform On Catalyst For The Apple III

=====

You may move VersaForm version 1.3 Release 2 (Applied Software Technology) to a hard disk for use with Catalyst. These instructions assume you are moving VersaForm to a ProFile (with driver name .PROFILE). Substitute the name of your hard disk driver for .PROFILE if you wish to install VersaForm on a different hard disk.

COPY PROCEDURE:

1. Boot the Catalyst diskette (if you haven't already).
2. From the Catalyst main menu select the Systems Utilities Program.
3. Enter "F" for File handling commands.
4. Enter "M" for Make a new subdirectory.
5. Enter "CATALYST/VF"
6. Enter "50" for the subdirectory size.
7. In the same manner, create the subdirectorys:"CATALYST/VFD" and "CATALYST/VF/WORK" also with room for 50 files.
8. Press "ESCAPE".
9. Enter "C" for Copy Files.
10. Copy all the files on diskette #1 to the subdirectory "CATALYST/VF/=" except for the following:

SYSTEM.MISCINFO SYSTEM.PASCAL SYSTEM.LIBRARY
SYSTEM.STARTUP BJTERM and BJSTART.CODE

To do this, type ".D1/" and press the up arrow key. A list of files is displayed in a box. The up and down arrow keys allow you to move an inverse bar over the name of your choice. Pressing the right arrow key marks the file so as to include it in the copy process. Mark all files to be copied in this way. When all files are marked press RETURN.

11. After all files have been copied, repeat step 10 for disks #2, #3, and #4.

.

NOTE: The files "RMSG2", "RMSG1", "RMSG0" and "CPCMENU" are duplicated on disk 4. When System Utilities asks if the previous copy of these files on the ProFile should be deleted, respond with "N".

12. Copy all files on diskette #5 to the subdirectory "CATALYST/VFD/=".

13. Copy "BJSTART.CODE" from the 3 DRIVE/HARD DISK boot diskette to "BJSTART.CODE".
14. Copy "SYSTEM.LIBRARY" from the 3 DRIVE/HARD DISK boot diskette to the following files:

```
BJSTART.LIB
CATALYST/VF/DESIGN.LIB
CATALYST/VF/FILING.LIB
CATALYST/VF/REPORT.LIB
CATALYST/VF/CPRINT.LIB
CATALYST/VF/PF.LIB
```

Additional Instructions

In order for VersaForm to find all of its files on your hard disk you must modify all the directory names within the program.

1. Boot the "3 DRIVE/HARD DISK" diskette.
2. Select option "7" (Exit to Pascal).
3. Type "X" for X(ecute from the Pascal Command Line.

NOTE: If you are using a hard disk other than ProFile, substitute the VOLUME name of your hard disk for /PROFILE in steps #4, #12, and #16.

4. Type "/PROFILE/CATALYST/VF/BJSETUP" in response to "Execute what file?".
5. Enter "5" for Customize existing configuration.
6. Press "RETURN" for the "*BJTERM" question.
7. Enter "N" in response to "Reconfigure function keys?".
8. Enter "N" in response to "Reconfigure dummy data character?".
9. Enter "N" in response to "Reconfigure reverse video?".
10. Enter "Y" or "N" to Reconfigure printer characteristics as required.
11. Enter "Y" to Reconfigure volume/directory names.
12. Set Program volume/directory names as follows:

```
Design program      = /PROFILE/CATALYST/VF
Filing program      = /PROFILE/CATALYST/VF
Report program      = /PROFILE/CATALYST/VF
Copy/Prnt program   = /PROFILE/CATALYST/VF
Rptwrk disk         = /PROFILE/CATALYST/VF/WORK
Default files vol   = /PROFILE/CATALYST/VFD
```

13. Enter "N" for Diagnostic mode.
14. Enter "Y" to write new configuration to disk.
15. Since you do not want to write copies of the configuration to separate disks, enter "N" for this question.
16. VersaForm will ask you to write the default configuration file you have just created to a location on your hard disk Enter "/PROFILE/BJTERM" for the pathname requested.
17. Enter "Y" or "N" for Listing configuration to printer as required.

ADDING VERSAFORM TO THE CATALYST MENU

1. Select the Catalyst Editor in the Catalyst main menu.

2. Enter "E" to edit the menu.
3. Use the up and down arrow keys to position the inverse bar over the entry you want the program to precede. Press "A" to add a program entry.
4. You will be asked for the display name of this program. Enter "VersaForm".
5. Enter "CATALYST/PASCAL" as the interpreter pathname.
6. You will be asked for a list of any extra drivers this program requires. Press RETURN.
7. Press "RETURN" for Character set path.
8. Press "RETURN" for Normal screen.
9. Press "RETURN" to use the default Keyboard.
10. Press "RETURN" to accept the default Initial prefix.
11. Press "RETURN" for the "Max files allowed ..." question. This will allow the program to be exited only by the QUIT option in VersaForm. This procedure is suggested due to the fact that files may be lost if the double Apple escape option is used. You may exit to the Catalyst main menu by typing "Q" from the Pascal Command Line.
12. Enter "BJSTART.CODE" when you are asked for the program path.
13. You will be asked if this entry is correct. If it is, answer "Y" then press ESCAPE to exit to the main menu. If you made any mistakes during entry, enter "N". You may then enter the number of the item you wish to correct. When all items are correct, press ESCAPE. Then press ESCAPE again to exit to the main menu.
14. Enter "5" to update the INTERPS file. When you are asked if you want to recalculate the load address, enter "N".
15. Exit to the CATALYST main menu by entering "Q".

Installing VisiSchedule On Catalyst 2.0 For The Apple III

Revised: 12/10/85
Security: Everyone

Installing VisiSchedule On Catalyst 2.0 For The Apple III

=====

You may move VisiSchedule to a hard disk for use with Catalyst 2.0, but you will be required to keep the VisiSchedule Program disk in the internal drive. These instructions assume you are moving VisiSchedule to a ProFile (with driver name .PROFILE). Substitute the name of your hard disk driver for .PROFILE if you wish to install VisiSchedule on a different hard disk.

COPY PROCEDURE:

1. Boot the Catalyst diskette (if you haven't already).
2. From the Catalyst main menu, select the System Utilities Program.
3. Enter "F" for FILE HANDLING COMMANDS.
4. Enter "M" for MAKE A NEW SUBDIRECTORY.
5. Enter ".PROFILE/CATALYST/VISISCHEDULE" with a default size of 25 files.
6. Press "ESCAPE".
7. Enter "C" for COPY FILES.
8. Copy the SOS.INTERP file from the VISISCHEDULE BOOT disk to the file ".PROFILE/CATALYST/VISISCHEDULE/INTERPRETER".

To do this, type ".D1/" and press the up arrow key. A list of files are displayed in a box. The up and down arrow keys allow you to move an inverse bar over the name of your choice. Pressing the right arrow key marks the file so as to include it in the copy process. Mark all files to be copied in this way. When all the appropriate files are marked, press RETURN. Then enter ".PROFILE/CATALYST/VISISCHEDULE/INTERPRETER" for the file to copy to and press return.

9. Copy the SYSTEM.STARTUP file from the VISISCHEDULE PROGRAM disk to the file ".PROFILE/CATALYST/VISISCHEDULE/SYSTEM.STARTUP".
10. When all files have been copied, press ESCAPE and return to the main menu.
13. Enter "*.PROFILE/CATALYST/VISISCHEDULE,SYSTEM.STARTUP" for the program path.
14. You will be asked if this entry is correct. If it is, enter "Y" then press ESCAPE to exit to the main edit menu. If you made any mistakes during entry, enter "N". You may then enter the number of the item you wish to correct. When

all items are correct, press ESCAPE. Press ESCAPE again to exit to the main edit menu.

15. Enter "5" to update the INTERPS file. When you are asked if you want to recalculate the load address, enter "Y".

16. Exit to the Catalyst main menu by entering "Q".

When you first select VISISCHEDULE from the Catalyst Main Menu, it will prompt you to install the VISISCHEDULE program disk in the internal drive. Do so and the program should run perfectly.

Changes in Word Juggler for the Apple II (vers. 2.7 or greater)

Revised: 12/10/85
Security: Everyone

Changes in Word Juggler for the Apple II (vers. 2.7 or greater)

=====

Word Juggler for the Apple II (version 2.7 or greater) differs from the older versions in two primary ways; by the elimination of the hardware modification and the addition of a number of enhancements to the program. The following list is a summary of all of the changes.

Enhancements to the program

New HELP feature

While editing a document, Open-Apple "?" will display a list of topics that, when selected, explain the various features of Word Juggler. Note that this replaces the old HELP command key (CONTROL V).

40 / 80 column support

Word Juggler for the Apple II will work in 40 columns on both the Apple IIe and the Apple IIc. When used on the Apple IIe, Word Juggler will use the 80 column card in the auxiliary slot if it is available. When used on the Apple IIc, Word Juggler checks the 40/80 column switch when the program is booted, and then reacts accordingly.

When used in the 40 column mode, Word Juggler changes in a few minor ways:

- o The main menu changes slightly.
- o The file name does not appear on the status line.

Main menu changes

- o Purge is now Delete.
- o Define Prefix is now Prefix.

Printer cards

- o When used on the Apple IIc, the printer card is permanently set to Super Serial to accommodate the two ports on the Apple IIc.
- o When used on the Apple IIc, the printer card must be used in Slot 1 or 2.

MOVE and COPY commands

Word Juggler now allows you to use the FIND and ^ FIND commands when prompted to "Move cursor to start (or end) of block and press space", in addition to the normal cursor movement keys.

FIND and ^ FIND commands

Hitting RETURN when prompted with "Find what?" will find the next occurrence of the string that was last searched for.

Titles and Page variables

The TEXT LINE/COL command now allows greater flexibility in choosing where on the page a title or page number can appear. In addition to specifying the absolute column number, titles or page numbers may appear on the left or right margin, centered between the margins, or alternating between the margins (which is useful when printing manuals)

Changes in the keystrokes

Because there is no keyboard enhancer included with Word Juggler version 2.7, some of the keystrokes had to be altered.

- o The Open Apple key is used to access the editing commands (instead of the CONTROL key used in the older versions).
- o The "overstrike" feature is no longer available.

Cursor Movement

	Used to be:	Now is:
o Previous Page	SHIFT Up-Arrow	Open-Apple Up-Arrow
Previous Word	SHIFT Left-Arrow	Open-Apple Left-Arrow
Next Word	SHIFT Right-Arrow	Open-Apple Right-Arrow
Next Page	SHIFT Down-Arrow	Open-Apple Down-Arrow
o Beginning of Document	CONTROL SHIFT Up-Arrow	Open-Apple E
Beginning of Line	CONTROL SHIFT Left-Arrow	Open-Apple S
End of Line	CONTROL SHIFT Right-Arrow	Open-Apple D
End of Document	CONTROL SHIFT Down-Arrow	Open-Apple X
o Straight Up	CONTROL Up-Arrow	Open-Apple CONTROL E
Straight Left	CONTROL Left-Arrow	Open-Apple CONTROL S
Straight Right	CONTROL Right-Arrow	Open-Apple CONTROL D
Straight Down	CONTROL Down-Arrow	Open-Apple CONTROL X
o Start of next line	CONTROL RETURN	Open-Apple RETURN
o Tab Set (and Clear)	SHIFT (and CONTROL) TAB	Open-Apple TAB
o Tab Inserting Spaces	SHIFT CONTROL TAB	Open-Apple Space

Printout Formatting Commands

The following commands not labeled on the command strip are now different:

Used to be:	Now is:
-------------	---------

- | | | |
|----------------|------------------|----------|
| o Else | ESCAPE CONTROL = | ESCAPE E |
| o 15 Pitch | ESCAPE CONTROL 4 | ESCAPE F |
| o Ragged Left | ESCAPE CONTROL 2 | ESCAPE R |
| o Triple Space | ESCAPE CONTROL 7 | ESCAPE T |

Margin Settings

Both the Top Margin and the Left Margin commands are now counted from "0" instead of "1".

Printout Enhancement Commands and Special Functions

Printout enhancements (such as bold and underline) and special functions (such as Lexicheck and Terminus) are now accessed with the Solid-Apple key instead of the Open-Apple key. Additionally, Print Form has changed from Open-Apple "." to Solid-Apple "2".

Variables are also entered with the Solid-Apple key.

Using Word Juggler with the Keyboard Enhancer

If you have a keyboard enhancer already installed and prefer to use the old commands, simply create a document called "OLD.COMMANDS" on the Word Juggler diskette and reboot. (It doesn't matter what is in this document, it just needs to be on the diskette.) This will allow Word Juggler to function almost the same as the earlier versions, while still having access to all of the program enhancements.

The functions that will behave differently are:

- o Help will still be accessed as Open-Apple "?".
- o Margins are still counted from "0" instead of from "1".
- o Print Form will change from Open-Apple "." to Open-Apple "2".

New features of Word Juggler 2.8

- o Print to Disk option - Allows incorporation of Word Juggler files with other program applications including terminal communications while retaining the original format of the document. This feature may be accessed by pressing Closed-Apple "9".

- o Built in Terminal Program - A scaled down telecommunication package based on Quark's TERMINUS program. This option is able to transmit and receive documents with as much ease as you would expect from a true telecommunications product. It will not, however, support any of TERMINUS' advanced transmission modes such as binary or compressed options.

The package allows you to define 4 Protocols, as opposed to Terminus' 16 Protocols. Furthermore, the Protocols support only two macros each, (the autodial and logon macros) while Terminus' Protocols can support up to 28 user-definable macros each.

Word Juggler for the Apple II Print To Disk Option

Revised: 12/10/85
Security: Everyone

Word Juggler for the Apple II Print To Disk Option

=====

The print to disk option in Word Juggler sends the formatted image of your document to a diskette file just as it would appear on your screen when you use the DISPLAY DOCUMENT feature. This print file is a standard ProDOS text file. Although the actual Word Juggler formatting commands (CENTER, JUSTIFY, etc.) are not written to this file, your text will appear formatted to their specifications.

This feature is accessed from the TEXT ENTRY MODE of Word Juggler with the command Solid-Apple "9". When selected, you will be presented with four prompts:

First page to print? - Enter the starting number to appear in your file. Press RETURN if you wish to start with page 1. Note that in this context, page number does not refer to the page numbers that appear on the output, but rather to the sequential number of the page.

Last page to print? - Enter the last page to appear in your file. Press RETURN if you wish to print to the end of the document.

Remove control codes from output? - If you answer "Y" (or press RETURN) to this question, the file sent to disk will not contain any printer escape code sequences. This is necessary if you wish to transmit the document using a telecommunications package. The escape codes may be interpreted by another computer in a variety of different ways causing errors in transmission or reception.

If you answer "N" to this question, all printer escape sequences will be saved to disk in addition to the text. This will allow you to print the file with all printer enhancements included, such as bold and underline.

Pathname? - Enter the name of the file to hold the format

NOTE: Apple Computer Inc. is not responsible for the contents of this article.

Apple II Memory Expansion Card: Diagnostics (11/96)

Revised: 11/21/96
Security: Everyone

Apple II Memory Expansion Card: Diagnostics (11/96)

Article Created: 16 December 1985
Article Reviewed/Updated: 15 November 1996

TOPIC -----

This article describes the Apple II Memory Expansion Card diagnostics. These procedures can be used for any RAM configuration.

DISCUSSION -----

Always verify the card size and the positioning of the ICs before running the internal diagnostics.

A card failure is indicated if the internal diagnostics will not run. In that case, remove the RAM, install them on an exchange module, and retest.

1. Install the Memory Expansion Card in any slot except 3 in a known good Apple IIe. No disk drive is necessary.
2. Power on the Apple IIe.

The words Apple II will be displayed at the top of the screen. The prompt and cursor will be displayed on the screen in the upper left hand corner.

3. Enter CALL -151 and press RETURN. The monitor prompt, *, will appear.
4. Verify which slot the Memory Expansion Card is in by entering cX0AG, where X is the slot number, and press RETURN.
5. The following display will appear. Verify the card size (RAM configuration) which appears is the actual size for the card installed (in this case a 256K card is installed). The dots appear on the screen as the card is tested. The test will repeat until an error is encountered or the ESC key is pressed.

MEMORY CARD TEST

ESC TO EXIT

TEST WILL TAKE 45 SECONDS

Seconds: 45 90 135 180

CARD SIZE = 256K

Card size: 256K 512K 768K 1024K

PASSES = 0001

....

....

....

....

....

....

CARD OK

Error Code Interpretation

The Memory Expansion Error Code Chart in the December 1985 mailing was incorrect. This article and the January 1986 mailing contain a corrected chart.

If an error is found during the internal diagnostic it will be displayed in one of the following formats: ADDRESS ERROR XXYYYY-ZZ or DATA ERROR XXYYYY-ZZ. There are, in fact, 4 error situations: address error, data error, non-existent RAM error, and card size error.

Address Error

An address error usually indicates a card failure. Remove all the customer's RAM, install them on an exchange module, and run the test again.

Data Error

Data errors usually indicate a RAM failure. The ZZ in the error code specifies the section of the card where the error took place. The XX in the error code specifies the suspected faulty RAM within that section. Ignore the YYYY.

Memory Expansion Error Code Chart

RAM locator Section
in specified section of card
 || ||
 XYYYYY-ZZ
 ||||
 ignore

Range of RAM Locator in specified

	C15	07 - 04	A15	
	C16	00 - 03	A16	

To locate DATA ERROR 08000 - 40 using the chart,

The bad chip is in section 40.

Card section	Chip number
ZZ	
40	C9
	C10
	C11
	C12

The bad chip is located where the RAM locator falls into the range that includes 08.

Range of RAM Locator in specified

Card section	Chip number	Card section
ZZ		XX
40	C10	08 - 0B

The position of the bad chip is C10. Replace the RAM chip on the card.

A x x x x x x x x x x x x x x x x

B x x x x x x x x x x X x x x x x x

C 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16

Re-run the diagnostic.

Non-Existent RAM Error

Any other section ZZ codes, for example 0B, 0E, FC, and so on, usually indicate a card failure. Remove all RAM and install it on an exchange module.

Other error codes might point to a RAM chip which is not installed, for example, if a 256K Memory Expansion Board gave an error of 0C0000 - 40, change the RAM which is installed in that section. If the test still gives the same error message, change the RAM in the adjoining sections.

Card Size Error

If the actual card size does not correspond to the card size listed on the built-in diagnostic, you will need to exchange eight RAMs. For example, if the card size indicated on the internal diagnostic is 768K, and the actual RAM on the card is 1 megabyte, remove the RAM at locations A1, C1, A5, C5, A9, C9, A13, and C13. Reinstall known good RAM and run the diagnostics.

If the card size is now correct, there may be one or more bad ICs among the RAM removed. Replace the removed RAM one at a time, testing after each installation, until the bad RAM is located.

If the card size is still incorrect, this will indicate a card failure. Remove all the RAM and install it on an exchange module and retest.

Macintosh II: Custom Video Extension Cable

=====

Article Created: 7 January 1988
Article Last Reviewed: 30 June 1992
Article Last Updated:

TOPIC -----

How can I make a custom video extension cable for a Macintosh II?

DISCUSSION -----

To make a custom video extension cable for a Macintosh II, you'll need a cable with a 75-ohm impedance value (usually RG59U standard coaxial video cable). Each line can be tied to the appropriate pin at the connector and the shield connected to the signal ground pin.

- Impedance: 75 ohm
- signal strength: 13.33 amps, 1 volt

The video signal can extend as far as 1,000 feet (though there is some color loss at this distance). The signal should be reliable up to 50 feet. The distance is limited by the loss of signal strength through cable resistance.

For more information on pinouts and cabling, search under "Macintosh II video signals".

Apple IIGS BASIC: Availability, Features and Specifications

Revised: 1/15/88

Apple IIGS BASIC: Availability, Features and Specifications

=====

This article last reviewed: 6 January 1988

Apple IIGS BASIC, available through APDA (Apple Programmer's and Developer's Association), is a RAM-based BASIC language for the Apple IIGS. Apple IIGS BASIC requires at least 512K RAM and one 3.5" disk drive.

Differences between Apple IIGS BASIC and Applesoft BASIC

Apple IIGS BASIC is entirely RAM-based. It doesn't rely on Applesoft at all. GS BASIC has additional commands, and many of the Applesoft commands do different things in GS BASIC. Some Applesoft commands (PR#, IN#, and HGR, for example) don't appear in GS BASIC at all.

Because GS BASIC and Applesoft files are stored differently on the disk, they are not interchangeable. GS BASIC is designed to run under ProDOS 16, whereas Applesoft can run only under ProDOS 8.

Summary of Apple IIGS BASIC Features

- Includes all standard BASIC commands.
- Provides access to external routines, which allow a BASIC programmer to call the Apple IIGS's ToolBox routines (QuickDraw II, Menu Manager, Window Manager, Sound Manager, etc.).
- Can define and call library routines. These are loaded with the INVOKE command, and called with the PERFORM and EXFN commands.
- Permits formatted program listings. Users can specify how much space appears between a line number and the first statement, and the amount of indenting to perform when listing program statement within a loop.
- Contains built-in constants and variables, such as PI, VPOS and HPOS.
- Enhances the GOTO, GOSUB, and ON xxx commands by allowing the programmer

to specify destination by labels instead of line numbers.

- Allows programmers to define specific procedures that are called with the PROC command. Not only does the PROC command perform the same functions of AppleSoft's GOSUB, but it also lets the programmer pass local parameters.
- Enhances the looping capabilities of Applesoft with the following looping structures:

```
IF..THEN..ELSE
FOR..NEXT..STEP
DO..WHILE..UNTIL
```

- Implements PRINT USING and INPUT USING.
- Gives the programmer the variable types Integer, Real, String, Double Real, Double Integer, and Long Integer.
- Has a powerful line editor.
- Includes some primitives (built-in low-level commands) that let the user interact with the ToolBox routines. The commands Eventdef, Menudef, and Taskpoll are included in GS BASIC itself because they provide a tying bind between the ToolBox and BASIC line numbers.

Variable Specifications

```
-----
Real:          (+ or - 1.7E38) (less than 1.5E-45 equals 0)
Double real:   (+ or - 1.7E308) (less than 5.0E-324 equals 0)
Integer:       (%) (2 bytes) (-32768 to 32767)
Double integer: (@) (4 bytes) (-2147483648 to 2147483647)
Long integer:  (&) (8 bytes) (-9223372036854775808 to 9223372036854775807)
String:        ($) 255 characters
Arrays:        (!)

Installing QC Hard Disk Drivers onto Catalyst 3.0.

Revised: 12/16/85
Security: Everyone

Installing QC Hard Disk Drivers onto Catalyst 3.0.

=====

The following steps are necessary in order to use a QC Hard Disk with Catalyst 3.0 (UniDisk 3.5) version.

Items Neccesary:

- A. Catalyst 3.0
- B. ProDOS/SOS diskette supplied with the QC Hard Disk.

1. Boot the Catalyst 3.0 disk. Select SYSTEM UTILITIES.
2. Select RENAME FILES.
3. Rename the file "CATSTART.SYSTEM" on the Catalyst 3.0 disk to "CATSTART.QUARK."
4. Return to the System Utilities Main menu and select COPY FILES.
5. Copy the files DRIVER.SYSTEM and QC.DRIVER from the ProDOS/SOS disk to the Catalyst 3.0 disk.

Reboot the Catalyst. The QC Hard Disk will now be seen as a Catalyst device.

Configuring Catalyst for the Apple III for the 10 Meg ProFile.

Revised: 12/20/85
Security: Everyone

Configuring Catalyst for the Apple III for the 10 Meg ProFile.

=====

You will need the following diskettes- Apple System Utilities, ProFile 10 Driver disk, and the Catalyst Master and Backup.

1. Boot the System Utilities disk.
2. Select System Configuration Program from the menu.
Note- (To exit from the following procedures to this Menu press the ESCAPE key.)
3. Select Read a Driver File.
 - a. Insert the ProFile Driver disk and press RETURN.
4. Select Edit Driver Parameters.
 - a. Select .ProFile and press RETURN.
 - b. Write down following information from the screen.
Unit number _____
Device type _____
Device subtype _____
Manufacturer ID Left two digits (High Byte) _____
Manufacturer ID right two digits (Low Byte) _____
 - c. press the Escape key twice.
5. Select Read a Driver File.
 - a. Insert the Catalyst master disk and press RETURN.
6. Select Edit Driver Parameters.
 - a. Select the second ProFile driver in the list and press RETURN. (The first driver in the list should be the new ProFile driver).
 - b. Write down the slot number _____
 - c. Select the first ProFile driver in the list and press RETURN.
 - d. Check the value of the slot number to see if matches the number above in step 6b. If it does not match. Press the Escape key twice and select Change System Parameters. Select option 2 then the first ProFile driver and press RETURN. When asked for driver slot enter the number from step 6b.If the slot numbers are the same go to the next step.
7. Select Delete A Driver.
 - a. Select the second ProFile driver in the list and press RETURN.
8. Select Edit Driver Parameters.
 - a. Select the Catalyst Driver and press RETURN.
 - b. Select option 6 (Configuration Block Data).

The Configuration Block Data is set up as follows:

BYTE	CODE	ASSIGNMENT
ØØ	OS	SLOT NUMBER
Ø1	UU	UNIT NUMBER
Ø2	TT	DEVICE TYPE
Ø3	ST	DEVICE SUBTYPE
Ø4	MM	MANUFACTURER ID (Low Byte)
Ø5	MM	MANUFACTURER ID (High Byte)

Byte Ø6 is the Directory buffering byte. Due to design of this new ProFile driver however, Directoy buffering as metioned in Appendix B of the Catalyst manual is no longer supported. Therefore the value of Byte Ø6 must be ØØ.

Bytes Ø7 - 11 are Checksum bytes. Their values must correspond to the following:

	Ø	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
ØX	OS	UU	TT	ST	MM	MM	ØØ	8F	97	8A	91	93	23	17	17	F6
1X	ØØ	B8														

c. Check values on the screen against the values listed in step 4b. If any of the values do not match use cursor keys to select the it and enter the correct value.

d. When all the values match press the Escape key.

e. Press the Escape Key twice.

9. Select Generate New System

a. Remove the write protect tab from the Catalyst Master disk.

b. Insert the Catalyst Master disk in the internal disk drive.

c. The cursor should be at .D2/SOS.DRIVER enter .D1/SOS.DRIVER and press RETURN.

d. After you recieve the message SYSTEM GENERATION COMPLETE. Press the ESCAPE key and re-install the write protect tab on the Catalyst Master disk.

10. Now boot the the Catalyst Master disk.

a. Check to see that the all programs and devices (Printers, Modem's, ...) work as they were before.

b. If everything is working correctly select System Utilities from the Catalyst Menu.

11. Select System Configuration Program from the menu.

a. Select Read a Driver file. Insert the Catalyst Master disk in the internal disk drive if it is not already there and press RETURN.

b. Press the Escape key.

12. Select Generate new System

a. Remove the write protect tab from the Catalyst Backup disk.

b. Remove the Catalyst Master disk and insert the Catalyst Backup disk in the internal disk drive.

c. The cursor should be at .D2/SOS.DRIVER enter .D1/SOS.DRIVER and press RETURN.

d. After you recieve the message SYSTEM GENERATION COMPLETE. Press the ESCAPE key and re-install the write protect tab on the Catalyst Backup disk.

10. Now boot the the Catalyst Backup disk.

a. Check to see that the all programs and devices (Printers, Modem's, ...) work as they did before.

Revised: 1/30/92
Security: Everyone

ImageWriter LQ General Troubleshooting (Part 2 of 3)

=====

This article last reviewed: 20 November 1987

NOTE: Detailed instructions for Take-Apart can be found in the Technical Procedures.

Printing Problems

Dots missing

1. Replace the print head.
2. Replace the main board.
3. Replace the print head to relay PCB cables.
4. Replace the relay PCB to main logic cables.

Printing continues on a paper-out condition

1. Test the paper-out sensor. If defective, replace it.
2. Replace the main board.
3. Replace the paper detect sensor.

Carrier moves but no printing

1. Replace the main board.
2. Replace the print head.

Nothing printed, the carrier doesn't move, and the power light is on
Perform the printer self-test. If the self-test passes, see Preliminary Checks, No Printing.

If the self-test fails, replace the main board.

Garbage printed

Replace the main board.

Printing too light

1. Perform the "Print Head Gap Adjustment".

2. Perform the "Platen Gap and Parallelism Adjustment".

Printing too dark

1. Perform the "Print Head Gap Adjustment".
2. Perform the "Platen Gap and Parallelism Adjustment".

Printing continues with front cover open

1. Test the cover-open sensor. If defective, replace the control panel PCA.
2. Replace the main board.

Color Printing Problems

Color bleeding

1. If the bleeding is consistent across the page, perform the "Color Ribbon Home Position Adjustment".
2. If the bleeding increases or decreases across the page, perform the "Color Ribbon Parallelism Adjustment".

Wrong color printed

1. Test the color ribbon detect switch. If defective, replace the color ribbon motor assembly.
2. Test the color ribbon home position switch. If defective, replace the color ribbon motor assembly.
3. Test the color ribbon motor. If defective, replace the color ribbon motor assembly.
4. Replace the main board.

Only one color is printed

1. Test the color ribbon motor. If defective, replace the color ribbon motor assembly.
2. Replace the main board.

Other Problems

Control Panel switches don't work

1. Test the control panel switches. If defective, replace the control panel PCA.
2. Replace the main board.

TESTING THE PRIMARY AND SECONDARY FUSES

Materials Required: Digital multimeter

Procedure

1. Turn off the printer and remove the main cover.
2. Remove the fuse to be tested and place a probe at each end of the fuse. The resistance of the fuse should be 0 ohms. If the resistance is not 0 ohms, replace the fuse.

o TESTING THE POWER SWITCH

Materials Required: Digital multimeter, Needle nose pliers

Procedure

1. Turn off the printer and remove the main cover.
2. Remove the power switch from the case by pressing the two plastic tabs at the sides of the switch with needlenose pliers while pushing the switch out of the case.
3. Connect the multimeter between the two white wires of the power switch and toggle the switch on and off.

When you turn the power switch on (1), the resistance should be 0 ohms.

When you turn the switch off (0), the resistance should be infinite.

If the resistances are not as indicated, replace the power switch.

4. Repeat step 3 for the black wires.

TESTING THE HOME POSITION SWITCH

Materials Required: Digital multimeter

Procedure

1. Turn off the printer and remove the main cover.
2. Disconnect the home position switch cable from main board connector CN10.
3. Connect the multimeter between pins 1 and 2 of the removed connector and toggle the home position switch with your finger.

When you depress (close) the home position switch, the resistance should be 0 ohms. When you release (open) the switch, the resistance should be infinite. If the resistances are not as indicated, replace the home position switch.

TESTING THE CARRIER DRIVE MOTOR

Materials Required: Digital multimeter

Procedure

1. Turn off the printer and remove the main cover.
2. Disconnect the carrier motor cable from main board connector CN5.
3. Connect the multimeter between the pins of the removed connector listed below and verify that resistances are as shown.

Pins to measure	Resistance (Ohms)
1 and 3	1.3
1 and 5	1.3
2 and 4	1.3
2 and 6	1.3
3 and 5	2.6
4 and 6	2.6

If the resistances are not as shown, replace the carrier motor.

For more ImageWriter LQ troubleshooting information see the following articles:

ImageWriter LQ General Troubleshooting (Part 1 of 3)

ImageWriter LQ General Troubleshooting (Part 3 of 3)

Refer to the Technical Procedures for the take apart instructions.

Using DOS 3.3 with Catalyst 2.1 (1 of 5)

Revised: 12/16/85
Security: Everyone

Using DOS 3.3 with Catalyst 2.1 (1 of 5)

=====

CHAPTER 1 INTRODUCTION OVERVIEW

DOS 3.3 BASIC and its associated Volume Manager (both supplied on your Catalyst diskette VERSION 2.1) may be used to access your DOS BASIC programs directly from your hard disk and have access to "DOS 3.3 volumes" on the hard disk.

The DOS 3.3 Volume Manager is used to create standard ProDOS files which appear as DOS 3.3 volumes to DOS 3.3 BASIC. To access these files, they must be "mounted" and formatted as a floppy diskette within your hard disk. All accesses to the hard disk on which you mounted the ProDOS file are then made to that file.

The Volume Manager also allows you to create a file (named MOUNTS3.3) which tells DOS 3.3 which slot/drive pair to run the startup program (HELLO) from, what ProDOS files to mount on selected slot/drive pairs, and whether or not to reserve room for DOS when you initialize a file or diskette.

When DOS 3.3 is selected from the Catalyst menu, it reads the MOUNTS3.3 file from the directory specified by the current ProDOS prefix. If no MOUNTS3.3 file is found, the following assumptions are made:

- DOS 3.3 will look for its startup program on slot 6, drive 1. If a HELLO program is not found there, you will receive an I/O error.
- No hard disk DOS volumes will be mounted for access.
- The INIT command will reserve room for DOS when you initialize a file or diskette.

The instructions below explain how to install DOS 3.3 BASIC and its associated Volume Manager on your hard disk through the Catalyst Editor program. The Volume Manager may then be used to create volumes on the hard disk for use by DOS 3.3, and to create the MOUNTS3.3 file to enable access to those volumes.

RESTRICTIONS:

1. Catalyst version 2.1 is necessary in order to use the DOS 3.3 option.

2. Copy protected DOS 3.3 programs can not be used.
3. ProDOS files (disk volumes) no larger than 800 sectors (200K) can be created, thus DOS program applications requiring more than 800 sectors can not be used.

INSTALLATION

To install DOS 3.3 BASIC and its associated Volume Manager under Catalyst, perform the following procedure:

1. Select the Catalyst Editor from the Catalyst menu.
2. When the Catalyst Editor main menu comes up, select the "Install program" option.
3. From the list of Program manufacturers, select the entry for "Apple Computer, Inc.".
4. Select the entry for "DOS 3.3 BASIC" from the list of Apple programs.
5. You are then prompted to insert the boot diskette of the program to install in the disk drive. Insert the Catalyst PROGRAM diskette in the disk drive, and then press the space bar.
6. DOS 3.3 BASIC and its associated Volume Manager (MAKE.MOUNTS) will then be copied from your Catalyst PROGRAM diskette to the CATALYST2E subdirectory on your hard disk. You are then returned to the Catalyst Editor main menu.
7. Enter "E" to Edit the Catalyst menu.
8. Using the up and down arrow keys, position the inverse bar over the "DOS 3.3 BASIC" entry which now appears on your menu. Type "A" to Add a program entry.
9. Enter "DOS Volume Manager" for the menu Display name.
10. Enter "CATALYST2E/BASIC." for the Interpreter path.
11. Press RETURN for the Initial prefix.
12. Enter "CATALYST2E/MAKE.MOUNTS" for the Program path.
13. If all the above has been entered correctly, press RETURN when asked "Is all this correct?". Otherwise, enter "NO" and fix the incorrect entry.
14. Press ESCAPE to return to the Catalyst Editor main menu. Enter "U" to Update the INTERPS2E file.
15. Enter "Q" to Quit from the Catalyst Editor.

NOTE: Since the ProDOS Prefix for the DOS 3.3 BASIC entry is automatically set to "CATALYST2E" by the above installation process, DOS will expect its MOUNTS3.3 file to be in that subdirectory.

NOTE: Apple Computer Inc. is not responsible for the contents of this article.

Using DOS 3.3 with Catalyst 2.1 (2 of 5)

Revised: 12/16/85
Security: Everyone

Using DOS 3.3 with Catalyst 2.1 (2 of 5)

CHAPTER 2

THE DOS 3.3 VOLUME MANAGER

If you have performed the above installation procedure, you may select the DOS 3.3 Volume Manager program directly from your Catalyst menu. Alternatively, you may select ProDOS BASIC and execute the program named MAKE.MOUNTS on your Catalyst diskette by typing "RUN /volume name of your hard disk/CATALYST2E/MAKE.MOUNTS".

1. Catalog

The first entry on the DOS Volume Manager main menu allows you to obtain a standard catalog of files on your hard disk or a floppy diskette. You are prompted to enter the pathname of the directory for which the catalog is to be displayed. In order to freeze the display, press CONTROL "S". Pressing CONTROL "S" again will allow the display to continue.

2. Create DOS 3.3 Volume

The second entry on the DOS Volume Manager main menu allows you to create a ProDOS file which can be used as a DOS 3.3 volume. When you select the "Create DOS 3.3 Volume" option, you are asked to enter the pathname of the new DOS 3.3 volume. Any standard ProDOS pathname may be entered such as "/P/CATALYST2E/DOS".

Next you are requested to enter the size of the volume. Volume size is specified in units of "sectors", where one sector is equivalent to 256 bytes or characters of storage.

The size you specify will depend on what you intend to use the volume for and how much room is left on your hard disk. Volumes must be at least 288 sectors (72K) in size, and may be no larger than 800 sectors (200K). The size you specify will be automatically rounded up to the nearest multiple of 16 sectors (4K). A standard floppy diskette contains 560 sectors (140K).

ADDITIONAL INFORMATION CONCERNING CREATING DOS 3.3 VOLUMES

Once the DOS 3.3 volume has been created and the size has been specified, you must mount it using the Edit Mounts option within Edit mount file for DOS 3.3 application described in part 4 of this chapter in order to grant access

to it.

Last but not least, you must initialize the DOS 3.3 volume in order to be able to store information to it. In order to do this, select DOS 3.3 BASIC from the Catalyst main menu. at the prompt "]" type INIT HELLO. The DOS 3.3 volume that you have previously mounted will be initialized for DOS 3.3.

3. Delete DOS 3.3 Volume

The third entry on the DOS Volume Manager main menu allows you to selectively remove previously defined DOS 3.3 volumes from your hard disk. All storage associated with a DOS 3.3 volume is released when IT is deleted. The freed storage is then available for use by any subsequent volume definitions.

Actually, you may delete any ProDOS file, not just DOS 3.3 volumes. When you select the "Delete DOS 3.3 Volume" option, you are asked to enter the pathname of the volume to delete. Any standard ProDOS pathname may be entered.

Note that deleting a DOS 3.3 volume does not remove it from any place where it may have been mounted. Your system may still contain a MOUNTS3.3 file with a reference to the deleted volume. Such a reference will be ignored, however.

4. Edit Mount File for DOS 3.3 Application

The fourth entry on the DOS Volume Manager main menu is used to create a new or edit an existing MOUNTS3.3 file for DOS 3.3 BASIC.

NOTE: Apple Computer Inc. is not responsible for the contents of this article.

Quark Technical Support

Tech Info Library Article Number:1583

Tech Info Library

Using DOS 3.3 with Catalyst 2.1 (3 of 5)

Revised: 12/16/85
Security: Everyone

Using DOS 3.3 with Catalyst 2.1 (3 of 5)

CHAPTER 2a

When DOS 3.3 BASIC is run, it reads the MOUNTS3.3 file from the directory specified by the current ProDOS prefix, and uses that information to determine on which slot/drive pair to look for its startup program (HELLO), what ProDOS files (DOS 3.3 volumes) to mount on selected slot/drive pairs, and whether or not to reserve room for DOS when you initialize a file or diskette.

When you select the "Edit Mount File for DOS 3.3 Application" option, you are asked to enter the name of the subdirectory containing your MOUNTS3.3 file. When you installed DOS 3.3 a MOUNTS3.3 file was created for you in the CATALYST2E subdirectory. If no MOUNTS3.3 file is found in another subdirectory you specify, you are asked if one should be created. If you enter a negative response, you are returned to the DOS Volume Manager main menu.

If the MOUNTS3.3 file is found (or if you request a new file should be created), you are presented with a display listing some of the file's attributes, including its location, the slot/drive which will be used to find the startup program (HELLO), and whether or not tracks will be reserved for DOS when you initialize diskettes or ProDOS volumes.

Also shown is a menu of options which allow you to set the HELLO program location, change the DOS track allocation for diskettes or DOS 3.3 volumes, and edit the mounts for your MOUNTS3.3 file. Pressing ESCAPE at this menu will return you to the DOS Volume Manager main menu.

If you select the "Edit mounts" option instead, you are presented with a list of all slot and drive combinations, and the DOS 3.3 volume currently associated with each pair.

You may mount DOS 3.3 volumes in any location except those slot/drive pairs occupied by a floppy diskette controller card which are noted with a "Disk II" entry. NOTE: The MOUNTS3.3 file can only work with one startup program (HELLO) located on a slot/drive pair at a time. You may, however, mount up to 12 DOS 3.3 volumes under it for access. In order to run a HELLO program from another mounted DOS 3.3 volume, you must select the SET HELLO PROGRAM LOCATION from the EDIT MOUNTS FILE FOR DOS 3.3. APPLICATION menu.

To edit the entry for a particular slot/drive pair, simply select the desired entry when asked, "Edit which mount?". You will then be asked for the "New mount file path". If you don't want any DOS 3.3 volume mounted on the selected slot/drive pair, simply press RETURN. Otherwise, enter the pathname for the DOS 3.3 volume you wish to mount. You will be warned if the name of the DOS 3.3 volume you supply cannot be found.

When you are finished editing the mounts, press ESCAPE and you will be returned to the menu of options for editing your MOUNTS3.3 file. If no further changes are desired, press ESCAPE again, and you are returned to the DOS Volume Manager main menu.

5. Quit

The last entry on the DOS Volume Manager main menu is used to exit the program. To return to the Catalyst menu, type "BYE".

NOTE: Apple Computer Inc. is not responsible for the contents of this article.

Using DOS 3.3 with Catalyst 2.1 (4 of 5)

=====

CHAPTER 3 COPYING DOS 3.3 APPLICATIONS TO THE HARD DISK

Many DOS 3.3 applications can be used with this system provided that the entire application can be installed in 800 sectors or less and it is not copy protected. A quick and easy way to copy applications to the hard disk is to first copy the Apple II File Developer (FID) program to a DOS volume on the hard disk, and then execute the program. To do this, perform the following procedure.

1. Select the DOS 3.3 Volume Manager from the Catalyst menu.
2. Select Create DOS 3.3 Volume from the menu and create a DOS 3.3 volume under the CATALYST2E subdirectory that is 800 sectors in size. This will give you enough room to copy the rest of the Apple System Master files to the volume if you wish. For this example we will use a pathname of /P/CATALYST2E/DOS. Remember that the only MOUNTS3.3 file that exists at this time that can be associated with the new DOS 3.3 volume is located in the subdirectory CATALYST2E. If you wish to locate the DOS 3.3 volume elsewhere, you will have to create a MOUNTS3.3 file for that location by using the Edit Mount File for DOS 3.3 Application option.
3. Once the DOS 3.3 volume has been created, press ESCAPE to return to the DOS 3.3 Volume Manager menu. It is now necessary to edit the MOUNTS 3.3 file for the newly created volume. Select Edit Mount File for DOS 3.3 Application from the menu. You will be asked for the subdirectory containing the MOUNTS3.3 file. Type /P/CATALYST2E and press RETURN.
4. For this exercise, we will mount the DOS 3.3 volume on slot 5, drive 1. Select EDIT MOUNTS from the menu. A list of all slot/drive pairs will be displayed. Select number 9 (slot 5, drive 1) from the menu and enter /P/CATALYST2E/DOS which is the pathname of the DOS 3.3 volume you have created. The volume will be mounted.
5. Press ESCAPE to return to the Edit Mount File for DOS 3.3 Application menu. If you will notice, the BASIC startup program is being run from slot 6,

drive 1. Since your newly created DOS 3.3 volume is mounted on slot 5, drive 1, you will have to change this. Select Set HELLO Program Location from the menu and change the slot/drive location to Slot 5, Drive 1.

6. Escape back to the DOS 3.3 Volume Manager menu and select QUIT.

7. At the "]" prompt, type INIT HELLO. The DOS 3.3 volume that you created and mounted will now be formatted for DOS 3.3. To prove this, type CATALOG. A listing with the file HELLO will be displayed.

8. Place your Apple SYSTEM MASTER disk in drive 1. Type CATALOG S6,D1" and press RETURN. Press RETURN until you arrive at the bottom of the catalog. At the prompt"]" type "BRUN FID" and press RETURN.

9. Select COPY FILES. At the prompt SOURCE SLOT? type "6", for DRIVE? type "1". For DESTINATION SLOT? type "5". For DRIVE? type "1". For FILENAME? type "FID".

10. The copy program FID will be copied to your hard disk. You may now access it from the hard disk by selecting DOS 3.3 from the Catalyst main menu and at the prompt "]" type "BRUN FID". You may now copy ANY non copy protected DOS 3.3 application to your DOS 3.3 volume.

In order to access DOS 3.3 applications from your hard disk, you may do one of two things:

A.

1. Select DOS 3.3 BASIC from your Catalyst menu.
2. At the BASIC prompt "]" type CATALOG.
3. Run the application as you would from a floppy disk. ie."] RUN filename".

B.You may create a Catalyst menu entry for each DOS 3.3 application.

Using DOS 3.3 with Catalyst 2.1 (5 of 5)

Revised: 12/16/85
Security: Everyone

Using DOS 3.3 with Catalyst 2.1 (5 of 5)

CHAPTER 4

MAKING CATALYST ENTRIES FOR DOS APPLICATIONS

You may now wish to make Catalyst menu entries for your individual DOS BASIC applications.

Each application which appears in your Catalyst menu must have an associated MOUNTS3.3 file describing the volumes to be mounted for that application (including the volume on which the application resides).

To make the Catalyst menu entry for your DOS BASIC application, perform the following procedure:

1. Select the Catalyst Editor from the Catalyst menu.
2. When the Catalyst Editor main menu comes up, select the "Edit Catalyst menu" option.
3. Using the up and down arrow keys, position the inverse bar over the menu entry you wish your program entry to precede. Type "A" to Add a program entry.
4. Enter the menu Display name for your application.
5. Enter "CATALYST2E/DOS3.3" for the Interpreter path.
6. Enter the prefix where the MOUNTS3.3 file for your application resides.
7. Press RETURN for Program path.
8. If all the above has been entered correctly, press RETURN when asked "Is all this correct?". Otherwise, enter "NO" and fix the incorrect entry.
9. Press ESCAPE to return to the Catalyst Editor main menu. Enter "U" to Update the INTERPS2E file.
10. Enter "Q" to Quit from the Catalyst Editor.

Note that the above Catalyst menu entry will simply execute the DOS 3.3 BASIC interpreter, passing it a specific prefix for a MOUNTS3.3 file.

The MOUNTS3.3 file referenced should be set up to mount the DOS 3.3 volume on which your application resides, and reference it as the startup volume. Since DOS always expects its startup program to be named HELLO, your application should have this name as well.

For example, if you wish to run the application CHECKBOOK from Catalyst, first

..TIL01586-Using_DOS_3-3_with_Catalyst_2-1_5_of_5.pdf

copy the file to the DOS 3.3 volume you created using FID. From the BASIC prompt "]" type "RENAME CHECKBOOK,HELLO".

NOTE: Binary files are excluded from the above discussion. In order to run a binary application, boot DOS 3.3 from the Catalyst menu and at the BASIC prompt "]" type BRUN filename.

Catalyst 3.0, Apple IIfc, and the CPU IIfc clock

Revised: 12/20/85
Security: Everyone

Catalyst 3.0, Apple IIfc, and the CPU IIfc clock

=====

At the present time, the Catalyst 3.0 is totally incompatable with any clock driver designed for the IIfc. The end result of combining the two applications results in destroying the Catalyst 3.0 system file rendering the disk unbootable.

CPU has been contacted regarding this matter.

Users who experience this problem may have their Catalyst disk recopied by Quark for \$10.00.

Catalyst 3.0 And Color Monitors

Revised: 10/14/88
Security: Everyone

Catalyst 3.0 And Color Monitors

=====

This article last reviewed: 29 September 1988

Catalyst currently does not support monitors that do not have a monochrome mode
Catalyst also does not support the Telex "Peacock" IIC interface with a
monochrome monitor.

Some of the problems seem to be caused by the Double-High-Resolution graphics
being turned off or disabled. Catalyst 3.0 must have the Double-High-Resolution
jumper installed on the 80 column card. Or the display will be totally
unreadable.

(NOTE: In cases where the the color bleed is the problem, switch to monochrome
mode.)

Recommended Color configurations:

Apple IIe

CARD	MONITOR	TYPE
Apple RGB 80 column	Apple Color 100	RGB
Apple Extended 80 column	Apple Color Monitor IIE	High Res Composite

Apple IIC

CARD	MONITOR	TYPE
N/A	Apple Color Monitor IIC	High Res Composite

Catalyst 3.0 and Memory Cards.

Revised: 12/20/85
Security: Everyone

Catalyst 3.0 and Memory Cards.

=====

There are currently two types of memory cards for the Apple II family of computers. First is the new Apple II Memory card from Apple Computer Inc. The other type is the RamWorksII, Z-Ram, and Multiram type cards. The latter cards are manufactured by Applied Engineering and Checkmate Technology Inc.

Catalyst 3.0 recognizes the Apple II memory card as a Ram disk when it boots. This due to the way this card is designed. The card can be installed into any slot in the Apple except for the Auxiliary slot for the 80 column card. This card looks like a disk drive to the system.

The Cards that install extra memory into the Auxiliary slot requires a program be run to tell the system that the memory is available. Due to this requirement Catalyst 3.0 does not know that the Ram disk exists. These cards install the extra memory as banks of memory thus requiring software to access it.

Features of Catalyst and Ram disks.

Catalyst will work with both types of Ram disks. However the the automatic program load features of Catalyst are only supported by the Apple II Memory board. The other Ram disks will be displayed on the desktop as a 5.25" diskette. These Ram disks can be accessed just like any other diskette. One note of Caution if a failure or power loss occurs any data in the Ram disk will be lost. For maximum speed the Catalyst System file should be copied to the Ram disk.

Installing Word Juggler version 2.9 on Catalyst 2.1

Revised: 12/20/85
Security: Everyone

Installing Word Juggler version 2.9 on Catalyst 2.1

=====

Due to a new format in the QUARK.INSTALL file present within Word Juggler 2.9 it is necessary to use MISCELANEOUS MANUFACTURERS option within the Catalyst Editor to sucessfully install it instead of using the Quark option. Using this procedure forces Catalyst to use the new QUARK.INSTALL instead of the one built into Catalyst 2.1.

Procedure:

Boot Catalyst 2.1
Select Catalyst Editor
Select Install Program
Select Miscelaneous Manufacturers
Put the Word Juggler 2.9 disk in the drive
Follow instructions on the screen.

IIc Monitors PROBLEM/CURE: Intermittent Flashing Screen

Revised: 1/30/92
Security: Everyone

IIc Monitors PROBLEM/CURE: Intermittent Flashing Screen

=====

This article last reviewed: 29 April 1988

PROBLEM DESCRIPTION: Video display intermittently appears and disappears.

CAUSE: RCA connectors on either end of the video cable from the monitor to the computer may not be making good contact.

CURE: Slightly crimp (squeeze with a pair of pliers) the shield part of the RCA connector on the video cable on both ends so that it makes slightly tighter fit on the monitor and the computer.
(DO NOT OVERCRIMP; it must be snug only).

If this cure does not resolve the problem, go to the Tech Procedures to obtain a General Troubleshooting procedure.

Omnis 3+ Multi-user on the Corvus Network

Revised: 11/16/87
Security: Everyone

Omnis 3+ Multi-user on the Corvus Network

=====

This article last reviewed: 16 November 1987

1) Multi-user Omnis 3+

Omnis 3+ multi-user version is a true multi-user program and will allow several users to access the same data simultaneously. The record-locking facility in Omnis 3+ automatically prevents two or more users from attempting to modify the same information at the same time, but allows an unlimited number of users to read the same information. The same copy of multi-user Omnis 3+ may be used to access different databases simultaneously. These features are built in and are transparent to both the user and the developer.

In order to use the multi-user version of Omnis 3+, care must be taken in installing Omnis 3+ and in configuring the network environment. Failure to properly install Omnis 3+ or correctly configure the network may result in the inability to run Omnis 3+ in the multi-user environment. In most cases, it could also result in the corruption or loss of data.

2) The Network

Multi-user Omnis 3+ may be installed on Corvus disk drives residing on the Corvus Omninet using the Contellation III (Release 2 or later) Network Software for the Macintosh. If you have the wrong system software, do not attempt to install Omnis 3+, call your dealer or Corvus to obtain the correct software.

We have assumed at this point that you have properly installed the network software and have physically connected your network together.

3) Volumes

There are four types of volumes in the Corvus environment: Private, Public, Controlled, and Uncontrolled. The following is a brief description of each,

additional information is available in your Corvus manuals and/or guides.

Private - can only be mounted by the owner; can be mounted as either read/write or read-only

Public - can be mounted read-only by any user; can only be mounted read/write by the owner

Controlled - can be mounted read/write by any one user; additional users may only have read-only access

Uncontrolled - can be mounted read/write or read-only by any user at any time; this is the type of volume used by Omnis 3+ shared files since all users must be able to both read and write simultaneously

4) Recommended Volume Configuration

Each user must have his or her own private volume which contains the Macintosh system documents (System, Finder, etc.) since these documents cannot be shared. The Omnis3.info file should also reside in this volume inside your system folder. Single-user applications can also be stored in this volume. The Omnis 3+ Utilities is a single-user application and should be stored in a private volume.

An uncontrolled volume should contain the Omnis 3+ program. The size of this volume is determined by the multi-user applications that are to be stored in this volume. Print resource documents (LaserWriter and LaserWriter Prep) must also be in this volume. The ImageWriter driver can also be stored in this volume, but care has to be taken to make sure that only one user at a time tries to print using this driver since it is a single-user resource. Loss of data may occur if more than one person tries to print using this resource.

A second uncontrolled volume should be created to contain the Omnis 3+ libraries and data files. This volume should be made as large as the anticipated size of all the data files. If possible, the volume should have enough free space to hold a copy of the largest anticipated data file in case a data reorganization is necessary.

5) Omnis 3+ Multi-user Considerations

Always maintain backup copies of all libraries and data files.

No other copy of Omnis 3+ should be available to the user of a multi-user version of Omnis 3+. Loss of data may occur if a user tries to access a database that is already being used by another copy of Omnis 3+.

Creation of new libraries or data files must be done through the Utilities in a private volume.

Omnis 3+ multi-user cannot automatically extend the size of the library or the data file. When the space allocated to the files have been used up, the user

will get messages that will inform them that the file is full. Use the Omnis 3+ Utilities to increase the size of the library or data file. At this point, it is recommended that all other users be logged off.

Omnis 3+ multi-user stores internal semaphore flags in the library to keep track of which records are being accessed. If Omnis 3+ or the network is interrupted while executing a multi-user application, a semaphore lock-up or corruption may occur. This will result in abnormal behavior while using the Omnis 3+ multi-user application. If this happens, there are two ways to clear the semaphore table:

Reboot Omnis 3+ while holding down the "Command-S" keys. Keep holding the keys down until the application has successfully launched.

Mount the volume which contains the library in a private volume and launch the Utilities program. Select the library with the corrupted semaphore table and go into "Library Utilities". Delete the semaphore table. This is the format labelled "WORK999". This will cause Omnis 3+ to re-create a new semaphore table when the library is launched. Mount the volume as an uncontrolled volume and launch the library.

ImageWriter and DMP: 5 A Fuse Keeps Blowing (Dead Printer)

Revised: 1/30/92
Security: Everyone

ImageWriter and DMP: 5 A Fuse Keeps Blowing (Dead Printer)

=====

This article last reviewed: 10 October 1990

NOTE: You will need an ohm-meter for this procedure.

PROBLEM DESCRIPTION: Printer has no line feed, carriage movement, or dot fire because the 5 Amp fuse is blown. After the fuse is replaced and Self Test is tried, the fuse blows again.

CAUSE: Probably either the line feed or carriage stepper motor has shorted a winding, causing the fuse to blow.

CURE: TO CHECK THE LINE FEED MOTOR (DMP and IW have same stepper motors)

1. Remove the logic PCB, disconnect plug CN1 (line feed stepper motor connector for both DMP and ImageWriter).
2. Measure for approximately 65 ohms between the following pins with an ohm-meter: 6 to 2, 6 to 4, 5 to 1, and 5 to 3.
3. If any measurement is significantly less than 65 ohms, that probably means that a winding is shorted in the line feed motor and it should be replaced. (The DMP's line feed stepper motor is not listed as a replacement part. However, the line feed stepper motor for the ImageWriter will also work for the DMP. ImageWriter line feed stepper motor P/N is 699-0109).

TO CHECK THE CARRIAGE MOTOR

1. Remove the logic PCB, disconnect plug CN3 (Carriage stepper motor connector for both DMP and ImageWriter).
2. Measure for approximately 10 ohms between the following pins with an ohm-meter: 6 to 2, 6 to 4, 5 to 1, and 5 to 3.

3. If any measurement is significantly less than 10 ohms, that probably means that a winding is shorted in the line feed motor and it should be replaced.

IF BOTH STEPPER MOTORS CHECK OUT

There is probably a short on the main PCB so replace it.

If this cure does not resolve the problem, go back to the Word Search screen and search on the product's name and HTS and GTS to obtain a General Troubleshooting procedure.

ImageWriter and ImageWriter II: Prints Out Hex Codes

Revised: 11/10/88
Security: Everyone

ImageWriter and ImageWriter II: Prints Out Hex Codes

=====

This article last reviewed: 20 July 1988

PROBLEM DESCRIPTION: When normal ASCII text is sent to the printer for a print it is printed in hexadecimal form (something like the hex dump below).

```
00 AF E3 5F 3D FF FF FF EF AF 5D 3E 5F FF FF FF FF FF
7F 9E 7A 4F FF FF FF FF 3F 12 1F 3F 23 23 DF EF AF 3D 5E
```

CAUSE: 1. If the Select button is accidentally pressed when the printer is turned on (something that is very easy to do with the IW II), the printer will print all text sent to it in hex.

2. Sometimes if the computer is turned off and on while connected to the printer, the printer may receive a glitch that it interprets as a command from its host (the computer) to print in hexadecimal.

CURE: In either case, turning off the printer and then turning it back on again will cause it to return to all default settings (including normal print mode).

LaserWriter P/C: Green LED Flashes Long While Then Goes Out

Revised: 1/30/92
Security: Everyone

LaserWriter P/C: Green LED Flashes Long While Then Goes Out

=====

This article last reviewed: 29 April 1987

PROBLEM DESCRIPTION: The 47 Ohm socketed resistor on the fuser safety PCB may be blowing.

CAUSE: The fuser bulb in the fuser assembly is not making good contact. The 47 Ohm resistor on the fuser safety PCB, which acts as a fuse, will blow to protect the rest of the fuser circuitry. Sometimes the fuser bulb is shaken out of good contact during shipment or the fuser resistor just fails. It does not necessarily mean that any other part on the fuser has failed.

CURE: Make sure that the fuser bulb is securely installed. Then replace the 47 ohm fuse/resistor on the fuser safety PCB.

If the above cure does not solve your problem, refer to the LaserWriter Printer Technical Procedures for the general troubleshooting procedure.

ImageWriter II: Ribbon Positioned Below Printhead (No Print)

Revised: 1/30/92
Security: Everyone

ImageWriter II: Ribbon Positioned Below Printhead (No Print)

=====

This article last reviewed: 1 September 1987

PROBLEM DESCRIPTION: When a properly operating printer is powered on, the carriage should move to the far left and then back to center of its travel. After this the black plastic cam at the right front of the ribbon platform turns causing the platform to its lowest position and then return to its top position (used for black print). With this problem, the ribbon platform moves to its lowest position but does not return to the top position so when the print starts, the ribbon is positioned below the printhead resulting in no ink transfer to the paper.

CAUSE: During the power up sequence described above, the lower front lip on ribbon cartridge is catching on the left brass washer securing the clear plastic paper guide to the carrier assembly.

CURE: Bend the washer down or file it back.

If this cure does not resolve the problem, go back to the Word Search screen and search on the product's name and HTS and GTS to obtain a General Troubleshooting procedure.

Macintosh XL : After Hard Disk is Swapped It Won't Boot

Revised: 1/30/92
Security: Everyone

Macintosh XL : After Hard Disk is Swapped It Won't Boot

=====

Article Created: 20 December 1985
Article Last Reviewed: 17 July 1992
Article Last Updated:

PROBLEM DESCRIPTION: After swapping the hard disk assembly (Widget), the hard disk will not boot or is not recognized as being attached to system. But the hard disk will boot if the hard disk assembly is removed while leaving the cables connected.

CAUSE: 1. The hard disk/micro disk assembly fits snugly into the Mac XL's cabinet. A number of screws terminate inside the disk assembly mounting area. These two factors make it very easy to accidentally damage the grey flat cable or the drive power cable when sliding the disk drive assembly into the XL.

2. A screw projects from the right of the main body of the Lisa cabinet into the Disk Drive cavity. On some Lisas, this screw interferes with a comfortable installation of the drive cage forcing the right rear lip of a metal shield on the HDA down. This stresses the motherboard on the HDA causing potentiometers on the HDA's PCB to misadjust.

CURE: 1. Replace the hard disk's grey flat cable. When reinstalling the disk drive assembly, remove the XL's top to help you to guide the assembly into its mounting place without damage.

2. Cut off the offending screw and if permanent visible damage has occurred to the PCBs, replace the HDA.

If this cure does not resolve the problem, go to the Tech Procedures to obtain a General Troubleshooting procedure.

MACINTOSH FAMILY DIAGNOSTIC RENEWAL

011-7091 Renewal, Macintosh Family Diagnostic
Updates--REQUIRED

The Macintosh Family diagnostics included in this package cover the following products:

CPUs: Macintosh, Macintosh Plus, SE, SE/30, Macintosh Classic/Classic II Color Classic, Macintosh II/IIx/fx/IICx/IIci/IIsi/IIvx/IIvi/IIvm Macintosh LC, LC II, LC III, LC 475, LC 520, LC 550, LC 575, Performa Series, Macintosh Quadra 605, 610, 650, 660AV, 700, 800, 840AV, 900, 950, Macintosh Centris 610, 650, 660AV, Apple Workgroup Server 60/80/95, PowerBook 100/140/145/145B/160/ PowerBook Duo 210, 230, 250, 270c, Macintosh Portable, Apple Macintosh TV, Power Macintosh 6100/60, 6100/60AV, 7100/66, 7100/66 AV, 8100/80, 8100/80 AV

Diskette

Drives: Macintosh 800K, Apple 3.5, Apple PC 5.25, 1.4MB SuperDrive

SCSI

Drives: Hard Disk 20, Hard Disk 20SC, 40SC, 80SC, 160SC, 400SC, 500SC, 1 GB; DDS-DC Drive, AppleCD SC, AppleCD SC Plus, AppleCD 150, AppleCD 300

Comm/

Network: LocalTalk, EtherTalk Card, AppleFax Modem, Portable Data Modem 2400, Apple Data Modem 2400, Ethernet NB Card, Int'l XP 2400, PowerBook FAX/Data Modem, Macintosh Express Modem

Printers: LaserWriter, LaserWriter Plus, LaserWriter II, ImageWriter LQ

Scanners: Apple Scanner, Apple OneScanner

Displays: 12-inch RGB displays; 12-inch Monochrome display; High Res Monochrome Monitor; High Res RGB Monitor; Macintosh 13-inch Color Display; Portrait Display; 16-inch Color Display; Two-Page Monochrome Display; 21-inch Color Display; Macintosh SE/30 Display; Macintosh Classic Display; Macintosh Classic II Display; Color Compact Macintosh Displays; Macintosh Portable Display; PowerBook Displays, 14" AudioVision Display, Basic Color Display

Video

Cards: Macintosh II Video Card, Macintosh II Display Card 8•24; 8•24 GC Card, 2-Page Monochrome Display Video Card, Portrait Display Video Card, Monochrome Video Card, High Res RGB Video Card, 4•8 Video Card, Apple High Performance Video Card, Apple AV Card

Other

Cards: Mac SE PC Drive Card, Macintosh II PC Drive Card, Mac IIci Cache Card, Apple IIe Card, Workgroup Server PDS Card, Power Macintosh

Upgrade Card

STARTER KIT HARDWARE DIAGNOSTIC TOOLS SOLD SEPARATELY:

Apple II Family:

077-0325 A Apple 5.25 Floppy Drive Test Reference Diskette

Apple IIe:

077-8219 C SCSI Loopback Test Card

Apple IIc:

077-8148 A Apple IIc Loopback Cable

Apple IIGS:

077-0317 A Apple II Video Overlay Card
Diagnostic; 1.0 (3.5)

077-8219 C SCSI Loopback Test Card

590-0552 A Cable, APM/ImageWriter II to
Apple IIGS/Mac Plus

Macintosh Family:

076-8354 A SIMM Removal Tool

Macintosh Plus:

077-8129 A DB 9 serial port plug (set of 2)--REQUIRED

077-8219 C SCSI Loopback Test Card

590-0552 A Cable, APM/ImageWriter to Apple IIGS and Mac Plus

Macintosh SE & SE/30:

077-8219 C SCSI Loopback Test Card

077-8265 A MINI DIN 8 Serial Loopback Plug

590-0551 A DB9M to MINI DIN 8M Cable

590-0553 B MINI DIN 8M to DB9F Adapter Cable

Macintosh II/IIX/IIfx:

076-0341 A IWM/SWIM IC Extraction Tool

077-8219 C SCSI Loopback Test Card

077-8264 A Macintosh II BUS Master Card

077-8265 A MINI DIN 8 Serial Loopback Plug

590-0551 A DB9M to MINI DIN 8M Cable

590-0553 B MINI DIN 8M to DB9F Adapter Cable

Macintosh IICx/IIci:

076-0341 A IWM/SWIM IC Extraction Tool

077-8219 C SCSI Loopback Test Card

077-8265 A MINI DIN 8 Serial Loopback Plug

590-0551 A DB9M to MINI DIN 8M Cable

590-0553 B MINI DIN 8M to DB9F Adapter Cable

Macintosh Portable:

590-0552 A Cable, APM, ImageWriter to Apple IIGS/Mac Plus

AppleColor Hi-Res RGB Monitor:

126-6605 A 330µF, 25V, Jitter Adjustment

AppleCD Products:

678-5064 A CD ROM Test Disc 2.0

LaserWriter/LaswerWriter Plus:

076-8354 A SIMM Removal Tool

077-8209 A AppleCAT LaserWriter Test Adapter Cable

LaserWriter II:

076-8354 A SIMM Removal Tool

077-8319 A LaserWriter II Test Connector

HARDWARE AND SOFTWARE DIAGNOSTIC TOOLS NOT INCLUDED IN STARTER KITS:

NOTE: The following tools listed as required are NOT included in the Diagnostic Starter Kits and Updates. Although not included, they are REQUIRED for support of the product listed.

Apple IIe:

890-5124 Loopback Plug, Communications Protocol Card

Apple III:

077-0009 A Clock Calibration Kit--REQUIRED

077-0013 B Apple/// Diagnostic Diskette--REQUIRED

Apple III Plus:

077-0032 A Apple/// Plus Dealer Diagnostic Diskette--REQUIRED

LISA:

077-8043 A Video Align Graticule, Lisa 1.0

077-8102 A Lisa Test for Lisa 1.0

077-8124 C Lisa 2/Macintosh XL Diag. 3.0--REQUIRED

077-8169 A Video Align Graticule for Mac XL/Lisa 2.0--REQUIRED

Macintosh XL:

077-0206 A Screen Mod. Kit Diagnostic 1.0--REQUIRED

Mac Plus:

077-0135 @ Macintosh Voltage Test Cable

077-8222 A SCSI Loopback Card to Mouse Port Cable

Macintosh II/IIx/IIfx/IIcx/IIci:

077-0104 A Twinax Cable w/DB 15 Connector

077-0105 A Twinax T-Connector

077-0106 A Twinax Terminator

077-0107 A Coax Cable

077-0109 A Token Ring Adaptor Cable

077-0256 * EtherTalk: Terminator Kit

077-0257 * EtherTalk: Thin Net Test Cable

Cluster Controller:

077-8156	A	DataLine Monitor ROM Pack-Utilities
077-8157	A	DataLine Monitor ROM Pack-SNA
077-8158	A	DataLine Monitor ROM Pack-BSC

AppleLine:

970-0879	A	Loopback Plug--REQUIRED
----------	---	-------------------------

LaserWriter/Plus:

076-0121	A	Power Checker, Laser--REQUIRED
----------	---	--------------------------------

LaserWriter II:

076-0121	A	Power Checker, Laser--REQUIRED
----------	---	--------------------------------

Color Plotter:

686-0020	A	Apple Plotter Interface Test
----------	---	------------------------------

Apple Scanner:

077-8300		Apple Scanner Service Test Chart
----------	--	----------------------------------

End_Table

@ Recommended for Stocking

* These tools are required only if you support the EtherTalk Card

Article Change History:

07 Sep 1995 - Made minor corrections.

04 May 1995 - Corrected minor problem; reformatted.

27 Jun 1994 - Updated information, revised formatting.

Hard Disk 20 P/C: First Time Start-Up = Init Failed

Revised: 1/30/92
Security: Everyone

Hard Disk 20 P/C: First Time Start-Up = "Init Failed"

=====

This article last reviewed: 29 April 1988

PROBLEM DESCRIPTION: When initializing a Hard Disk 20 with a known good Mac, the Mac displays an "Init Failed" message.

CAUSE: The HD 20 may have a failed Controller PCB.

CURE: Replace the modules in this order:

1. Controller PCB
2. Analog PCB/HDA Module

If this cure does not resolve the problem, go to the Technical Procedures to obtain a General Troubleshooting procedure.

Apple 800K Drive Mechanism and Cable Compatibility

Revised: 9/16/88
Security: Everyone

Apple 800K Drive Mechanism and Cable Compatibility

=====

This article last reviewed: 6 January 1988

Drive and Cable Compatibility Chart

(YES = Compatible NO = Not Compatible)

	APPLE 3.5 MECHANISM Part # 661-0345 MFD-51W-03 red on silver label	800K DRIVE MECHANISM Part # 661-0305 MFD-51W or 51W-10 black on silver label
INTERNAL MACINTOSH	Yes- w/ yellow internal drive cable part # 590-0437	Yes- w/ red internal drive cable part # 590-0167
EXTERNAL 800 K DRIVE	YES	YES
UNIDISK 3.5 DRIVE	YES	YES
APPLE 3.5 DRIVE	YES	NO

NOTES:

1. If an Apple 3.5 Drive mechanism (P/N 661-0345) is installed as an internal Macintosh drive, it will require a YELLOW striped internal cable (P/N 590-0437) in order to operate.

2. If an older version of the Apple 800K Drive mechanism (P/N 661-0305) is installed as an internal Macintosh drive, it will require a RED striped internal flat cable (P/N 590-0167)

in order to operate.

3. It is possible to install the recently released Apple 3.5 Drive mechanism in an external Macintosh 800K Drive or in a UniDisk 3.5 Drive. However, you should NEVER try to install the older verison 800K Drive mechanism in an Apple 3.5 Drive.

4. You can distinguish the Apple 3.5 Drive mechanism (P/N 661-0345) from the older version 800K Drive mechanism (P/N 661-0305) by its Apple and vendor part numbers. Also, each mechanism has a different colored drive label. Refer to the chart above for the details.

ImageWriter II P/C: How to Run LoopBack Self Test

Revised: 1/30/92
Security: Everyone

ImageWriter II P/C: How to Run LoopBack Self Test

=====

This article last reviewed: 29 April 1988

DESCRIPTION: There is a way to test the interface port on the ImageWriter II without requiring a Macintosh.

1. Build a connector with pins 3 and 5 jumpered together (touching no other pins) and pins 1 and 2 jumpered.
2. Press the Print Quality switch while you Power on the IW II.
3. If a failure occurs search on HTS and GTS for the IW II communications troubleshooting procedure.

Apple IIf Monitors : Wavy Video Display

Revised: 9/29/90
Security: Everyone

Apple IIf Monitors : Wavy Video Display

=====

Article Created: 19 December 1985
Article Last Reviewed: 17 July 1992
Article Last Updated:

PROBLEM DESCRIPTION: Video display exhibits a "waving" or
"rippling" effect.

CAUSE: Stand alone power supply manufactured prior to 4584 (i.e.
the 45th week of 1984).

CURE: Check the stand alone power supply date code. If
manufactured prior to 4584, exchange the power supply.

This repair is eligible for warranty coverage to those customers who have
purchased AppleCare for their system. For all others the repair cost
responsibility lies with the customer.

If this cure does not resolve the problem, go to the Tech Procedures
to obtain a General Troubleshooting procedure.

Monitor II PROBLEM/CURE: Picture Rolling

Revised: 1/30/92
Security: Everyone

Monitor II PROBLEM/CURE: Picture Rolling

=====

This article last reviewed: 29 April 1988

PROBLEM DESCRIPTION: After the Monitor II has had a chance to warm up, the picture just won't stop rolling.

WARNING: Remember to turn off the Monitor II and unplug it whenever the case is removed for the procedure below.

CAUSE: 1. Vertical Hold misadjusted
2. Bad electronics module
